Chemists may talk very wisely about regular prescriptions and doses for plants (a kind of vegetable doctoring), but Mr. Sherwood, with his practical sagacity in combining his manures, intrusting to the instinct of the corn to make its own selections (doctoring itself), if he does not beat science, raises most satisfactory crops. Like other farmers who calculate closely as to profits, Mr. Sherwood keeps a flock of well selected sheep, from which he sells wool and lambs. A small dairy furnishes a surplus of butter, the milk being used to promote the growth of pigs. He has enlarged the old rule of "a pig to a cow," by obtaining Victoria stock, which are remarkably easy keepers; and by adding to the milk a little ground feed, and allowing it to ferment slightly, it is more easily digested and wholesome. He can thus double the number of pigs allowed by the old rule, and thereby add to the profits

My father made a serious mistake when he started his young orchard. While Mr. Sherwood feels grateful for his orchard, which produces hundreds of barrels of apples, he regrets that there is such a large variety, many of which are unmarketable, and, of course, of little value. The truth is, father was a good-natured man and wanted to please everybody, and so he grafted into his orchard everybody's "best apple." Among other sorts was a seedless kind, fair to look upon, but so tough and dry that it has no merit except as an exception to the law of nature which provides for its own propagation. Mr. Sherwood believes in care and painstaking. His farm and grounds everywhere show evidences of this characteristic. He has removed fences between fields, thus doing away with needless expense and making the land more convenient for tillage. In winter his hens receive special care and are watered daily with warm water, and given a variety of feed, including coal ashes, which Mr. Sherwood has discovered they are very fond of, picking out the charred bits. The hens have a warm place to roost in. The result of this attention is that the owner sells more eggs than any of his neighbors.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

FILTH IN THE FLOUR BARREL.

HENRY STEWART.

THE RURAL'S remarks upon "CLEAN CEREAL FOOD" in the issue of August 7th, are very pertinent and timely. There need to be some sharp things said on this subject. The miller, however, is by no means the man to bear the blame. It was once my fortune to own a farm with a grist mill attached, at which a large amount of custom work was done for the neighboring farmers. Some merchant work was also done for large lumbering establishments and tanneries within a circle of 10 to 20 miles, and much grain was purchased for this purpose. Milling was a new business to me and the experience very soon gave me a new idea of the remarkable carelessness of the farmers and the loss to which they subjected themselves thereby. It also showed in a most astonishing manner what an amount of dis-

agreeable filth people consume in their bread, cakes, pies, and puddings; and, moreover, what risks are run, and what mischief results from this cause. Certainly, as a rule, we are not sufficiently careful in regard to the cleanliness of our food or of our drink.

Many years ago the filth in which men lived was appalling, and the consequences were fearful. Plagues, pests, and epidemic diseases of many kinds, some now happily unknown except historically, ravaged whole countries and continents, destroying victims by thousands; and we now know that the cause of these destructive diseases was simply filth. But filth still claims its victims, and now since it is known that the most virulent diseases which infect the human race originate from parasitic organisms that enter the blood from without, it is of the utmost importance to use only pure, clean food — water being included in this term.

Now the truth about this matter is, that domestic vermin foul our staple food to an extent that would be alarming, were it widely known. This truth first dawned upon me when in a flour mill in St. Louis, at the time when St. Louis flour was considered the best in the country. There the hoppers which fed the stones were filled with wheat of which certainly one or two per cent. was the excreta of rats and mice. A similar thing occurred in a mill in a large town near Philadelphia, and I have seen the same occurrence in a very large flour mill in Brooklyn. In my own mill, the great majority of grists brought in by farmers were so fouled, and some were so badly mixed with this filth that I refused to receive them on the ground that the portion taken for toll would be too much depreciated in value to pay for the work. It is impossible to screen out the whole of this foul matter, and this must be obvious when it is considered that the interstices of the screens through which a grain of plump wheat will pass, will permit anything else of the same shape and size or of less size to pass through them.

It is well known that these vermin are infested with the worst parasites; and that these go from them into other animals, as cats, dogs, and pigs, and from these into sheep and oxen, and from these into human beings. It is thus that trichinæ and tape-worms are carried from these filthy creatures into our food animals.

The excretæ of animals infested with parasites are charged with the eggs of these creatures, and it is in this way that most parasitic diseases are communicated from one animal, or class of animals, to another. It may be very well believed that the universal presence of mice and rats in barns, granaries, elevators and mills is a most serious danger to public health, and that we take into our stomachs, and thence into our blood, in many unsuspected cases, the germs of virulent diseases. That these are not more frequent is not so much due to the circumstance that the causes are not present, but that it is only when these causes affect such systems as are enfeebled or debilitated by some previous circumstances that they produce their usually fatal results.

Leaving, however, out of the question all sanitary considerations, it is enough to consider it in regard to the mere cleanliness of our staple food. This is a sufficiently disagreeable view to take of it, and one which, when seriously entertained, should have the effect of causing a war of extermination against these vermin, pestiferous in every sense of the term, for truly they are not only pests in themselves, but they carry pests wherever they go, and reveling in filth, they befoul everything they come in contact with. It is within the truth to declare that 90 barns, granaries and corncribs out of every 100, are infested with these vermin; and that the grain taken from them can be detected by any moderately sensitive nostril, even if it is not fouled conspicuously to the sight. The bolts of the mills *may* gather some of the filth, but it is only the coarse matter that is thus stopped in transit to our stomachs. Alas! the moralist may say, "How hard it is to be godly!" the sanitarian may say, with equal truth, "How difficult it is to be clean!"

Horticultural.

SIZE OF THE GREGG RASPBERRY. THE SNYDER BLACKBERRY.

Readers will recall our cut of the Gregg raspberry as it was sent to us by a friend. During the past season the Gregg has fruited at the Rural Grounds, and we were obliged to admit that our engraving represented the fruit as smaller than it usually grows under fairly favorable conditions. A few weeks ago Mr. Roe brought specimens to the office, of which our illustration shows the average size.

Rural: "It does not grow so large with us."

Mr. Roe: "Nor does it with me. These are exceptionally large berries growing upon shoots of the present season. On an average the fruit is but little larger than that of Mammoth Cluster, and I doubt if it will yield more in a season."

In the course of the day Mr. P. B. Mead called. "Ah!" he exclaimed, "those are the largest Greggs I have seen." Later, Mr. Kingsbury, of the Indiana Farmer called.

"Those are the largest Greggs I have seen," he said.

Still later, Dr. Hexamer called. "What is it?" he asked. "Gregg," we replied. "Ah, indeed, I have never before seen them so large."

THE GREGG RASPBERRY.—FROM LIFE.—FIG. 272.

Reader, the illustration of an unusually large Gregg is before you. Compare this with our first illustration, page 165. You may rely upon it the average size of the Gregg raspberry lies just about midway between.

Mr. Roe brought with him a branch of the Snyder Blackberry which was heavily laden with berries. The Snyder is very hardy, from all accounts, as well as prolific, but we do not see any reason why anybody should give up the Kittatinny in its favor. The berries are much smaller and we cannot agree with those who pronounce them of superior quality —that is, sweeter, for sweetness in the blackberry is the most that constitutes quality.

The Windsor Chief Strawberry.

Mr. Lovett, in speaking of Windsor Chief Strawberry (p. 502), indulges in the remark that it "is still Champion—nothing more and nothing less." If he means that *the two are entirely similar*, I have only to question the fitness of the language employed. If, however, he means that they are not only similar, but *identical*—or, in other words, that the alleged parent is really doing duty as offspring—I cannot avoid a feeling that he ought to sustain such charge by some fact or facts beyond the circumstance of even entire similarity. The apparent reproduction of a variety, in both plant and fruit, is certainly an exceedingly rare circumstance, still I see no warrant for assuming its impossibility. My motive for this reference to the matter lies in the fact that it seems to me important that the nomenclature of pomology should be guarded with great jealousy, and hence, if the Windsor Chief is in fact a reproduction, and in no sense an improvement, the true course would be to eradicate the plant from our grounds and the name from our lists—not to treat it as a synonym. T. T. L.

RURALISMS.

I am a connoisseur in salads, and place the tomato among the best of them. The Acme is the best of all tomatoes for this purpose. It may be cut into either thick slices or cubes, and should be put into a colander to drain. The dressing should be a little stiff and creamy. A plain dressing may be made of mustard, oil, salt, and a very little vinegar; but this cannot be made creamy. There are comparatively few who know what a delicious dish a tomato salad is, and I expect to be thanked for telling the others.

The larger kinds of peaches are now (Aug. 12) beginning to arrive in New York in great quantities. Prices, however, are somewhat high for the better kinds; but they will soon be cheaper, and there promises to be enough for all. I never heard of a ripe peach hurting anybody. It was the first thing Dr. Tanner ate at the close of his wonderful fast, and started him off flesh-making at the rate of five and a half pounds a day. Eastern peach trains, made up of about thirty cars each, now leave New York two or three times a day, and even Maine is thus abundantly supplied. When I was a boy peaches were so plentiful in Westchester county that the pigs were turned into the orchards to eat them; not little Amsdens or Alexanders, but great, luscious peaches nearly as large as Newtown Pippins. The trees were then raised from pits, and lived to a healthy old age, free from the yellows. I think the best peaches or the healthiest trees are now raised in that way at the West.

For a window-box for Summer use there is nothing, to my mind, that equals the single petunia. Window-boxes, I am glad to see, are becoming quite common in our large cities, and are a pleasing relief to brick walls and cobble-stones. In some of the finest streets the boxes are of Minton tile and other expensive ware, while in other streets I find wooden boxes, tin boxes, firkins, tomato cans, and what not; but the single petunia, whether on Fifth Avenue or the Bowery, in Minton tile or tomato cans, is the queen of window-box flowers. The Germans seem to take great pride in adorning their windows with flowers, and sometimes have boxes extending the whole front of the house. Others train morning-glories from the second story to the eaves. They look charming. Petunias and morning-glories alone would give a charm to the very humblest of homes.

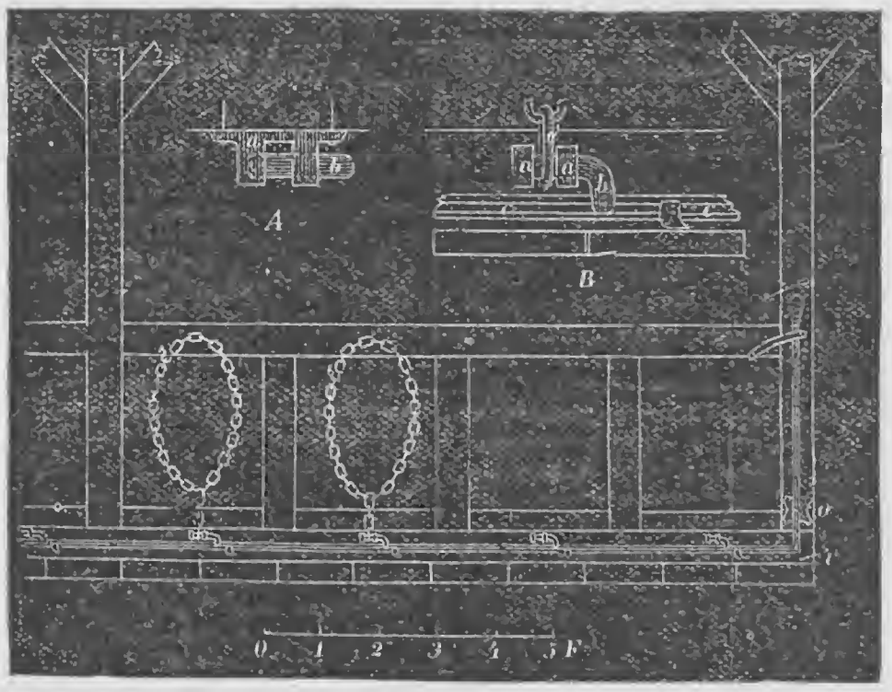
I see that some of the daily papers are again planting the Eucalyptus globulus in and around New York city, not, perhaps, being satisfied with former efforts. Tree planting is healthy exercise, and if planting the Eucalyptus amuses them, why, let them go on; but when they have succeeded in making one survive our Winters, will they please let the public know it? In the meantime I would suggest, in a fraternal spirit, that they occasionally read some of our horticultural papers. It will do them no harm, and may do them some good.

When the potato beetle first appeared here, the question arose whether there were two broods in one season, which was speedily settled in favor of two. The question is now as to three. I must go on the record for three. They are now (August 12th) laying eggs for the third time. I have given up to them a couple of plants for the purpose of studying their habits and experimenting with the various kinds of "cures," taking good care to limit the number of beetles. It is astounding to think what their numbers would be if means were not taken to kill them.

[There has been no time the present season when we could not find eggs upon our potato vines.—Eds.]

WINTER GARDENING.

Select a sunny situation convenient to the kitchen, and lay off a square of 120 feet. Haul on to this 10 loads of manure, leaf mold and sand, which turn under with a big plow, and pick off the stones. Surround this with a fence. Set stout posts six feet long, at intervals of seven feet. To these nail, with spikes, rails 4x2 inches thick and 15 feet long, the ends meeting on every other post, one at the top, the other one foot from the bottom where a plank one foot wide and one inch thick is nailed to an offset on the post, to make it level with the paling whose lower end touches it. The strips for palings are 16 feet long, four inches wide and ½ inch thick. Saw each in halves straight across; saw these halves in two, slanting three inches. Thus from one strip you get four palings with one end straight, the other sharp, and no waste but the sawdust.



DANISH PLAN FOR FIRE ESCAPE.—FIG. 273.

First nail on two palings (one temporarily) whose equal hight is ascertained by sighting, 14 feet apart, or the length of a strip of plank too stiff to sag which must be tacked, as a guide, to the tops of the two palings; then by a plumb and line, fill up this space with palings two inches apart, and even with the guide plank at the top, also touching the base plank at the bottom and so on. The gate must be made upon the same plan, and hung to large square posts at the middle of the front line of fence. From this gate a walk four feet wide divides the garden in halves. Another, the same width, crosses it at right angles in the center.

Cut off a border three feet wide, against the fence, by a walk the same width, running entirely around the garden. Subdivide the two front quarters by paths crossing each other at right angles. This will make eight beds 26 feet square, and two original quarters, in the rear, 52 feet square, and a long border separated by permanent walks. Define the walks, by narrow plank kept in place by pegs, till a set of border plants is obtained — perennial flowers or pot-herbs. At the end of the main walk, against the fence facing south, make a pit or hot-bed for forcing early plants.

A summer-house of octagon shape may cover the intersection of the main walks. Set a post on each side of the four walks radiating from the center, at such distance from the center that every side of the octagon will be equal. Lattice the four sides, cutting the corners of the beds, leaving those over the walks open. Finish with a steep roof and spire. Against each latticed side plant a grape-vine. If Isabella, train inside; if Delaware, Concord or Clinton, train outside. On the inside of the lattice, have four boxes, four feet long and high enough for seats, with lids and locks, for storing garden requisites.

Between the fence posts set dwarf fruit trees; between these currant, raspberry or gooseberry bushes, and one row of strawberry plants in the border, entirely around the garden, save where the hot-bed and asparagus bed have been reserved.

Plant your onions now. Spade up and level one of the smaller beds. Lay it off with a heavy rake having teeth one foot apart, by dragging it across the bed, setting the first tooth in the last row each time it is moved. Check it; then drop a large and a small onion alternately at the intersection of the rows; plant them, and cover with leaves or litter from the hen-house, with enough sweepings or ashes thrown on to prevent the trash from blowing off. Treat the strawberry border the same way, and your winter gardening is done. In the early Spring you will give your onions a top-dressing of ashes mixed in the hen-house. Get your pea-sticks and tools ready for Spring. M. L. S.

The Herdsman.

FIRE ESCAPE IN THE COW STABLES.

In Europe where a large number of cows are often stabled in one building—sometimes several hundred—it is not an unfrequent occurrence to hear that nearly all these poor creatures have perished in case of fire, mainly because in the way they are ordinarily fastened they cannot be let loose rapidly enough. We now and then hear of similar incidents in dairy districts of this country, and, indeed, as the country grows older they are becoming more and more frequent.

The accompanying illustration which we reprodnce from a Danish paper, represents an ingenious, though simple, device by which a whole row of cattle can be loosened in a moment and driven out should an outbreak of fire require it.

The cattle are supposed to be tied by chains or leather straps, which are fastened near the foot-piece running along the front of the stalls. For every-day use the chains are opened by the ordinary method of unhooking them, but the device is so planned that in an emergency the chains are unhooked at their fastenings and remain around the necks of the animals. It consists of a movable iron bar of any convenient length, laid longitudinally at the head of the stalls. At the center of each stall this bar has a bolt fastened, which works into a forked eye, securing a link of the chain and thus fastening it. When the bar is moved back in the direction, C, by the lever at the end, which turns around the point, P, all the bolts pass out of the forks and the animals are at liberty. The arrangement is shown more in detail at A and B; A being a view of the bolt from above, and B a side view of the fastening; a, a, show the fork, b, the bolt, c, c, the bar and d, a link of the chain.

This arrangement is not expensive, and it strikes us as being very desirable and practical in barns where twenty or more head of cattle are fastened. Some such precaution seems more particularly to be needed in barns built of wood, for in these when filled with hay and straw fire spreads with great rapidity.

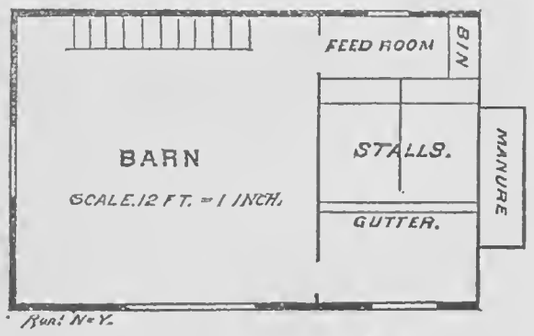
Dairy Husbandry.

THE DAIRY COW—NO. 6.

HENRY STEWART.

How to Lodge a Family Cow.

THE proper lodging of a cow, that is the character of the stable and its arrangements, is worthy of serious consideration. Upon it depend the economy in labor and expense of feeding, convenience, cleanliness, the comfort and health of the cow and the saving of manure—the latter being by no means the least of all these: for by good management the owner of one cow and a garden may be able to regain in the value of manure at least one half of the cost of the feed. I have done this myself and know that it can be done anywhere and everywhere. The stable may be located conveniently near the house if desired, because a well-kept stable will never be disagreeable in any way to the most fastidious housekeeper. Therefore I would have the stable for a family cow near the house, and not a hundred feet distant. It may be made to include a wood-house, a store-room, a dairy room and a garden tool house. It shou'd be located upon rising ground, or so that water flows every way from it. The water from the roof should flow into a cistern, which will supply all the water needed.



COW STABLE.—FIG. 274.

The stable should have an upper loft for hay and a store-room below for feed. The plan here given will be found convenient and may be used for a cow stable only or for the wood-shed and other purposes. A building 24x16 feet and 16 feet high will be roomy and convenient. The cow stalls should be three and a-half feet wide and 12 feet long in all. It is well to have two stalls; the extra one may be wanted, if not for a cow for some other purpose. To preserve cleanliness the floor should slope backwards a trifle, to a shallow ditch placed four and a half to five feet from the inside edge of the feed trough, in which ditch the droppings may fall. This will leave room behind for a broad passage from which a door leads into the barn. The manure gutter should drain into a manure tank outside. This is best made with a brick wall and covered with a tight trap-door to keep out flies in the Summer time. For this purpose, too, some powdered copperas may be liberally sprinkled over the manure and in the gutter. This will absorb all the smell and destroy the larvæ of house and dung flies which would otherwise gather by thousands in the manure. The feed trough should be two feet from the floor to the top, 16 inches wide, 12 inches deep which is sufficient to hold a full mess of cut grass or corn fodder. In front of the feed trough is a partition four feet high, and in this a falling door is made across the whole front of the stall on a line with the top of the feed trough, by hanging one of the boards upon hinges and securing it by a cord, so that it can fall only to an angle of 45 degrees and so make a slide by which to put the feed into the troughs. The feed passage will be three feet wide and in front of the stall or stalls. It should be provided with a neat, covered, feed bin at the end.

The remainder of the building may be used for various purposes, for a carriage house if a horse is kept, or for wood, coal, storage, etc., etc. A stairway may be made in one corner leading to the upper floor, and the pump and cistern may be conveniently placed under it. Where only one cow is kept, a very cheap shed with no upper floor will be sufficient and $40 will be amply sufficient to lodge a family cow with every comfort and convenience. The floor should be of cement or brick, or of hard-rammed clay. Wood is the least desirable floor. A cement floor is the best, and if well made, it is vermin-proof. It should be made of one part of Rosendale cement and three parts clean sand, mixed dry and then with water into a thin mortar and then with seven parts of coarse gravel. This should be laid three inches deep and have a top coat of half an inch of the clear mortar for a finish. A washing with a few pails of water occasionally will clean off such a floor and keep it sweet. The safest manner of fastening for a cow is with a broad leather strap around the neck, with a ring in it, and a short rope fastened to an auger-hole near the top of the front of the trough, having a snap hook attached to the free end. The rope need only be 18 inches long or sufficient to permit the cow to lie down without the possibility of getting her foot over the fastening.

The utensils required for the stable are a smallest-size copper strip or other fodder cutter costing $7; a scythe, a corn knife, a box in which to mix the feed; a water pail; a card and brush; a shovel and a hoe for the manure, a stiff broom and a wooden hay fork. The card and brush are indispensable, and should be used upon a family cow for two or three minutes before milking, twice a day. Any owner of a cow, who is considerate of her comfort, could not neglect to card and brush her after having once discovered the gratification she experiences from the service, and I have found no other way so effective to induce a wilful cow to let down her milk, when she holds it up for a newly arrived calf, as to give her a gentle and thorough carding and brushing, especially about those parts which her serviceable tongue cannot reach. While enjoying the brushing she forgets her troubles and gives her milk readily.

The Poultry Yard.

ARTIFICIAL CHICKEN HATCHING.

L. S. HARDIN.

In a late issue the RURAL published an interesting article from the pen of Mr. Henry Hales, on the subject of artificial incubation. There were a freshness and courage about the article that pleased me—it is so hard to find a writer who dares to tell the disagreeable truths about farm machinery of any kind. For months I have been trying to find out the bottom facts about incubators with the intention of buying one if I approved of it; but all I could see was unlimited praise. Chicken papers devoted to the business occasionally allowed dark hints of artificially hatched chickens failing to reach maturity. This was absolutely all I could learn against the plan. Yet it did not seem to grow in popularity as it should, if only one-half the claims of incubator makers were true. There is evidently a dark spot somewhere, and we will never find it until some man with the courage of Mr. Hales tries the best machines, and tells the whole truth about them

To approximate this result in as great a measure as the time and circumstances would permit, after reading his article, I took train for Coney Island where the managers of a new hatcher have two large-sized machines in full operation. The house is a simple one-story frame, with large doors and windows, leaving the machines with scarcely any protection against the rapid changes of temperature peculiar to a sand island in the ocean where it is as hot as tophet in mid-day and very cold at evening. Each machine holds 1,500 eggs or 3 000 eggs in all, hatching at the rate of 100 chicks a day. The machines having glass sides, realize the claims of the handbills in these words, "The full process of hatching, from the first pip of the egg until the chick emerges in triumph from the shell is all exposed to full view."

Remembering Mr. Hales's failure in that the chicks did not get out of the shell readily, I marked this point particularly. Something like a dozen eggs were pipped when I first arrived, and the chicks from about one-half of these got out of the shell before I left, in something like two hours. The others had made fair progress. I did not note any failure on the part of the chicks to make some progress in this time toward freeing themselves from the shell. Those that had dried off before I left were as strong as any chicks of their age I had ever seen, and my experience in this line is pretty extensive with the old hen.

The next stage—chicks under twenty-four hours old—I watched and criticised with close attention, for here could be seen any inherent weakness due to the "bringing up," as we say of children; but of the "bringing out" as we should say of these chicks. The managers use small glass cases, such as are used in making aquariums, to put the young chicks in. Here they nestle together and have the appearance of a fine brood that have just lost their mother, but are not conscious of their misfortune. Sleepy the little things certainly were until somebody rapped on the glass with a pencil, when each little head was wide-awake, and the little things scrambled over one another to get to that side of the glass—this, too, before they were old enough to care to eat. In fact, they were the liveliest lot of little chicks I had ever seen.

These hatchers had been in operation only about nine weeks, so that the oldest chicks in the artificial mother were under two months of age; but the largest were well grown and apparently as well feathered and as active as chicks of that age ever are. I bought some and took them home, and the above was the universal verdict of my neighbors. All the chicks in the "mother" were in fine condition and very active. I noticed but one out of several hundred, that was out of sorts. There was no appearance of languor or weakness that I was so much on my guard to detect, since reading Mr. Hales's article. He says:

"In assisting the little creatures to freedom, I found the shells of the hatching chicks in a condition entirely different from that of an egg hatching under a hen; that from the incubator was as hard as a newly-laid egg, while that from under a hen was quite soft and easily broken, having a rotten appearance, as it yielded quite easily to the pressure of the young chick."

To test this we took from the drawers an egg just pipped and with a pencil point broke pieces from the shell. They were very brittle, resembling very closely the rotten shell of an egg hatched under a hen.

Was not the great cause of Mr. Hales's want of success the cheapness of his machine—not that high price alone adds to the efficiency of machinery, but we all know that the art of hatching chickens artificially has not reached that point of perfection where the greatest skill can be omitted to secure success. The want of perfect uniformity of temperature may not kill the chick in the egg while rendering it so weak that it cannot break the shell. Imperfect supply of moisture may cause the egg to dry up too much or rot from excess of moisture. These points are so vital that none but the best of machinery will meet their requirements and only the best of skill, coupled with long and patient experience, will supply their omission. I wish Mr. Hales would trade that cheap machine off for one of the most approved patterns, and give us his experience with it; for it is the other side that we are now most anxious to learn about.

THE DORKING BREED OF FOWLS.

NOTWITHSTANDING all attempts at rivalry for the past half century, especially with the large Asiatics, the Dorking still maintains its ascendancy among the fowls of England. We may attribute this to its possessing the same superiority of qualities among its kinds, as Short horns have among cattle, and because it is the best for general purposes. Fowls of this breed are of a size sufficiently large to suit the most fastidious for the table; their flesh is superior to that of any other breed except the Game fowl; the hens lay fairly, and are steady sitters and good nurses; while their chickens are hardy, grow rapidly, and mature early Lastly they are fine-looking, of noble presence, and excel all other breeds for crossing.

The nearest approach to a Dorking is the Houdan; but I have not found the chickens so hardy or easily raised; and the top-knot is objectionable as it occasionally blinds them. Both these breeds excel in giving plenty of meat on the breast and other parts of the body where most desirable. They are not made up mostly of rump and legs.

I wish the fifth toe could be bred off, as it is a mere ugly excrescence. A Dorking occasionally comes without it, and such are fully equal in size and all other qualities to the best of the five-toed. If these could be kept and bred from to the exclusion of others, the ugly fifth toe might be got rid of almost entirely in a few generations. A.

Pomological.

THE ARTIFICIAL PRODUCTION OF FRUIT BY GIRDLING.

Mr. W. I. CHAMBERLAIN gives in the RURAL NEW-YORKER of July 24 an interesting account of the *girdling* method of inducing apple trees to fruit readily as practised by Mr. J. B. Spaulding, Illinois. But he suggests a pertinent reflection when he queries what would be the effect of thus girdling trees on sandy or stiff clay land. While I agree that the girdling progress is to be heartily recommended under certain conditions, I feel, with Mr. Chamberlain, that such radical treatment should be carefully studied as to its ultimate effect under various conditions. The process, I must confess, suggests too much the "panacea" idea. It apparently applies one method to a host of individuals just as our public school system is supposed to turn out perfect scholars by the application of like methods of education to each and every child. There is, however, a system of girdling or checking the sap which is, I believe, closely related to that described by Mr. Chamberlain, but at the same time more logical. The French have practised it for at least fifty years and perhaps in modified forms for ages, while the Switzer can show you apple orchards that have been similarly treated and fruited for generations. I cannot give a name to the operation, but it consists simply of long or short incisions made in the bark above any given leaf to make the growth woody, and to produce fruit-bearing wood below. By varying the length and depth of the incisions and applying them on any branch or even twig, the movement of the sap can be checked and guided at will. Early and abundant fruitfulness comes by this method at least as well as by any other. Besides, it is more scientific. Its girdles or, more properly, incisions, are long or short, few or many, as the case may be, and applied at just the best points instead of being limited to a strict line around the trunk of the tree, which may or may not do violence to its health and longevity. Unfortunately we do not value the longevity of a tree properly, in this country, but simply want immediate and immense results; hence, perhaps, the special charm of Mr. Spaulding's girdling method. Soil, climate, character of growth each year and conditions of the bark must be considered under this system more carefully perhaps than under any other. The balance of force is so completely upset by such a system of girdling that good management is necessary to continue steadily healthful action, if, indeed, ultimate unhealthy conditions can be really prevented.

I believe it should be evident that while the girdling process produces early and continued crops under certain conditions of soil and climate, the incision process is the more truly scientific, because it is not violent, but adjusts itself in skillful hands to every reasonable environment. Mr Spaulding's work is founded on sound natural laws and works well in his case, but the value of the incision process has been proved by long years of successful practice in many countries. S. PARSONS, JR.

WATERLOO PEACH.

THE multitude of new, very early peaches, which have been, for the last few years, claiming the attention of fanciers of this fruit, has forced upon planters the necessity of caution, in the selection of the varieties to be planted. The Alexander and the Amsden were eagerly caught up, and are already making their mark in the markets. But when, with the advent of the Saunders, Wilder and Downing, we began to hear rumors of others, some of them claiming to be still earlier than these, the conviction began to force itself upon us, that it was best to wait and see what would be the outcome of all this. Under this state of affairs, when the first notices of the Waterloo fell upon the public ear, they were little heeded, notwithstanding the authority that the reputation of Ellwanger & Barry may be assumed to carry with it; but when its actual performances had come to warrant the indorsement of such high and conservative authority as Chas. Downing, the Horticultural Editor of the Country Gentleman, and others, the proof of its worth became in some sense irresistible, and as a consequence this peach seems to be coming to the front more prominently, perhaps, than any other of the new, very early sorts. It is yet too soon for me to have fruited this peach, which I understand to have originated quite recently near Rochester, N. Y., It is said to have the general qualities of the class to which it belongs; all of which are semi-clings, with the general qualities of Hale's Early; which is, with much apparent reason, supposed to be the parent of the race. Its season, in the latitude of its nativity, may be set down as about the third week in July; or about a week in advance of Alexander and Amsden. After making all reasonable allowance for the overestimation of novelties, I have the impression that the Waterloo will, very probably, take a prominent place as an amateur, and possibly even as a market peach. T. T. LYON.

The Japan Quince.

Allow me to add to your commendation of the fruit of Cydonia Japonica in the RURAL of August 7, that it is not only very palatable when cooked, either separately or to add flavor to other fruits, but that it cooks *very quickly*, and that it does not even require to be pared, since the skin breaks down in cooking as readily as the flesh. In fact, to my apprehension, it is in all respects as desirable for this purpose as our common quince, with the single exception of its lack of productiveness. In this particular there seems to be a remarkable difference between varieties, and even between plants of the same variety—a circumstance that may warrant the hope that its productiveness may be improved by reproduction with this object in view, very possibly without in any respect diminishing its attractiveness as an ornamental plant. I regard this as a promising field for experiment, and the more so because this plant is so eminently hardy, and so entirely free from the various casualties to which our common quince is so generally subject. T. T. L.

The Vineyard.

Specimen Grapes.

WE have received from Mr. John Burr, of Leavenworth, Kansas, some specimen bunches of fine grapes. Of them he says: "No. 1 is a small bunch of a very early grape; it was ripe July 20; but is now so shriveled as to be nearly worthless, except as showing exceptional earliness. No. 2 is not quite ripe.

These are seedlings of the Delaware, and this is their second year of fruiting. No. 3 is from an uncommonly vigorous vine—its second fruit crop. No. 4 is white, very sweet and delicate—the second fruit crop. Next season the bunches will be double the size, as the vine is strong and vigorous. No. 5, white, is from a two-year-old vine, its first fruit. It is not quite ripe. To give you nearly their relative time of ripening, I give the time each of them began to show color as follows: No 1 on July 2; Early Victor, July 7; Moore's Early, July 21; No. 3, July 22; and Concord, July 26.

We cannot in Kansas grow any of the choice hybrids or tender varieties as they universally mildew, blight, rot and winter-kill to such an extent that they are worthless in open ground culture. I do get a few bunches occasionally from Catawba, Iona, Delaware, Salem, etc., with the greatest care and protection. My experience for the last dozen years has been with seeds from the most hardy varieties calculated to succeed anywhere without mildew or blight."

REMARKS.—Early Victor shows fine qualities. Compact bunch, strong skin. Better than Concord for table and no doubt an excellent sort for wine, as Mr. Burr intimates.

No. 1, as stated, was too shriveled to enable us to judge as to its quality. We should say it is a very sweet grape. No. 2 also seems of a rich flavor. It is hard to believe that No's 1 and 2 are Delaware seedlings. They bear no resemblance at all to their parent. No. 4 (white) is sweet and delicious. The grapes, judging from bunches sent, are variable in size. It is hard to form any judgment that is worth anything from single specimens. The Early Victor, judging from what we see, will prove a valuable acquisition. All were received in good order.

Field Crops.

ABOUT SEEDLING POTATOES.

IT is incorrect to talk about hybrid seedling (so-called) Irish potatoes. All of our cultivated potatoes belong to one class—Solanum tuberosum. A new seedling is a new variety only. From some cause they seem to have become barren of seed balls; I think for the reason suggested in the editorial of July 14—want of pollen. I have been baffled in the same way. Garnet Chili and Brownell's Beauty are most apt to carry pollen. Occasionally a season comes when other varieties carry it. Ordinarily the flowers abort for want of it. I once had a seedling that ran to seed balls instead of tubers. If the wild potato from Colorado—Solanum Fendleri—could be used, a true hybrid would result. All my efforts in this direction in this climate are failures, usually for the same reason on account of which you failed. But there are others. I can furnish the seed of this potato for this purpose. Another climate might result more favorably. The tubers are not quite as large as hickory-nuts. The flavor and quality are good. The Pueblo Indians are very fond of them. They do not seem to be affected with Peronospora infestans—the fungus that causes potato rot. I fear any attempt to improve the size of the tubers by cultivation is likewise a failure; the plant does not seem to respond to improved conditions; still, further time may solve the problem favorably. D. S. MARVIN.

[We have always contended that the word "hybrid" ought not to be applied to crosses between varieties of the same species. But what we can't understand is that all new kinds are introduced to the public as being crosses between this, that and the other, when from 70 different kinds which we are now growing, we have not yet succeeded in procuring a grain of pollen. Again, we cannot understand how packets of "hybridized" seeds can be sold for 25 or 50 cents each by seedsmen.—EDS.]

Scientific and Useful.

LIGHTNING RODS.

IN the reply to W. S. on this subject, you say that it is a disputed question, "whether the discharge of lightning is conducted away on the surface, or through the body of the rod," and also "use no insulators." If the Editor who wrote the reply will study the principles of the "Leyden jar" and the "Insulated stool," as used in connection with the electrical machine, he will find that the capacity of the Leyden jar is in exact proportion to the surface covered by the tin foil *inside and outside*, and that insulation* is the only method known which will confine the electric fluid within any desired limits.

These two points comprise the main principles of lightning rods. There is no doubt that a conducting tube is much better than a conducting rod, as it has more surface, and that without insulation the electricity is very liable to be diverted from the conductor by any metallic body near its course, as nails, spikes, clamps or spouting, or by any *wet* surface, water being a natural conductor.

The popular idea is that lightning always comes down a rod, while the fact is that it as often goes up from the supercharged earth to a negative cloud. Electricity constantly seeks an equilibrium; when a cloud or the earth is overcharged it is said to be positive; if undercharged, it is negative, and a thunder storm merely restores the equilibrium, which lasts only until the friction of a cloud through the denser atmosphere creates an excess and then it unloads, often at the expense of any ill protected terrestrial object, or into a negative cloud, there being always a mutual attraction between positive and negative bodies. A tube of the same outside diameter as a rod has nearly twice its conducting capacity, because the inner surface is also effective.

Copper is the best conductor of electricity; it does not rust, requires no paint, is stiff in tube shape, and is only objectionable when cost is an object. In 1856 I put upon a building in Philadelphia six copper tubes six inches in diameter, arranged both as water and lightning conductors; the structure has never been struck by lightning.

Lightning will pass quietly and harmlessly down a rod which has a sharp point, but if the point is blunt an explosion takes place producing thunder and damage. Rods in time, after having received many charges of electricity, become melted at the point and thus blunted, and are then liable, with a heavy charge, to destroy the building, and in that condition are more dangerous than no rod, as they really attract the charge to the building.

One hour's time spent with an electrical machine, having Leyden jars, insulated stools, thunder house, connecting chains, discharging rods, electrometers, etc., will teach a thinking man more than half the books ever written on the subject, because every writer, with scarcely an exception, has a hobby of his own based upon theory and not upon experience. Sixty years ago my father was the only manufacturer in this country of philosophical instruments for colleges, and from the age of ten years I have been familiar with electricity practically.

I will conclude by giving the essential points in a safe lightning rod. First, a platina point, because it resists corrosion and intense heat better than any other metal; second, a copper tube, because copper is the best conductor and a tube gives the most surface; third, glass insulators, because glass is the best non-conductor; fourth, a termination in water or moist soil, because water is the best disseminator; and, finally, a straight, plain, perpendicular surface, to allow the lightning to pass off instantly, as every bend, twist or curve is only an impediment, liable to divert the fluid from the rod to the building.

Let it be clearly understood that a lightning rod attracts thunder clouds to a building which the building itself would not attract, and the necessity of a good and sufficient conductor is plain enough. A rod is a powerful attractor at all times, and if it is not a perfectly safe conductor take it down as soon as possible. S. RUFUS MASON.

Dodge Co., Neb.

* Note the care used to perfectly insulate telegragh wires.

REMARKS.—So little has yet been ascertained with regard to the nature and mode of action of atmospheric electricity that there is a good deal of room for differences of opinion on many points connected with it, and, in fact, we find wide variance in the views of the most noted electricians. While Sir W. S. Harris, perhaps the best authority on lightning rods, agrees with our friend, Mr. Mason, that extent of surface, rather than quantity of metal in the conductor, is the measure of its power, many other electricians hold the contrary opinion, so that among such conflicting views of those who have made electricity a special study, with all the advantages obtainable from the appliances mentioned by our friend, it is hardly safe as yet to dogmatize on the subject. For ourselves, after considerable study of the matter, we are decidedly of the same opinion as Mr. Mason, although we deemed it right to state, in the article referred to, that there are still doubts about the point on the part of those whose thorough acquaintance with the study entitles their opinions to respectful consideration.

The insulation of the rod from the building we hold, as stated, to be objectionable. Sir W. S. Harris, says:—"The practice is not only useless, but disadvantageous, and is manifestly inconsistent with the principles on which conductors are applied." Dr. Franklin says: "The rod may be fastened to wall, chimney, etc., with staples of iron. The lightning will not leave the rod to pass into the wall through the staples. It would rather, if it were in the wall, pass out into the rod to get more readily by that conductor to the earth." As to the insulation of telegraph wires, our friend seems to forget the vast difference between the tension of Voltaic electricity and frictional electricity, lightning being of the nature of the latter. It is a matter of frequent observation that whenever lightning strikes the telegraph wire, it jumps from the wire to the posts, frequently tearing a number of them to pieces, a fact that seems to be conclusive on this point.

The idea that lighting rods attract lightning or thunder clouds to the building to which they are attached, is opposed to the opinion of leading electricians and to probability. It is hardly likely that an agent which moves with such terrible celerity and force can be deflected from its course by a small piece of metal in the form of a conductor. With most of the other remarks made by our friend we agree.

NEW-JERSEY AGRICULTURAL EXPERIMENT STATION.

V.

THE following analyses of ground bone have been made from samples that are now in our markets, August, 1880:

	15.	29.	31.	34.	38.	41.	43.
Nitrogen in organic matter.....	2.45	3.29	.98	2.80	3.94	3.37	.74
Total phosphoric acid.....	19.10	26.25	9.55	12.45	23.84	25 50	31.34
Estimated value.....	$23.30	42.94	15.59*	24.86*	40.00	44.84	42.25
Market price.....	$38.00	38.00	32.00	32.00	36.00	44.00	28.00

* These samples are sold under the name of bone dust, and as such they have been analyzed and their values estimated. They really contain soluble phosphoric acid—31 having two per cent., and 34, 1½ per cent. of that substance. This variation from ground bone should be published in the manufacturer's statements of composition. When used in the computation of values, it brings their estimated values one or two dollars a ton higher than given in our table. Both these fertilizers have been widely sold, and largely and satisfactorily used.

It is probable that the manufacturers have put a little acid sulphate of soda in the ground bone to keep it from heating in the barrels or bags; and this has rendered the bone soluble, and makes it quicker in its action.

15. Crescent Bone, made by Lister Brothers, Newark. From stock of Elias Runyon & Sons, New Brunswick. Sample was taken by the Station, and it was in good condition.

29. Pure Ground Bone Fine, manufactured by Mapes' Formula and Peruvian Guano Co., 158 Front St., N. Y. From stock of A. Vermeule & Son, New Brunswick. It was sampled by the Station. In good condition.

31. Allentown Bone Manure, manufactured by the Allentown Manufacturing Co., Allentown, Pa. From stock of C. M. Norton, Hightstown. In good condition. Sampled by Geo. B. McChesney.

34. Celebrated Ground Brone, manufactured by Lister Brothers. Newark. From stock of C. M. Norton, Hightstown. In good condition. Sampled by Geo. B. McChesney.

38. Pure Ground Bone, manufactured by E. Wahl, Philadelphia. From stock of W. Fitzgerald & Co., Camden. Sampled and sent by S. L. Burrough, Merchantville. In good condition.

41. Pure Bone Sawings, made by H. Preston & Sons, Greenpoint, L. I. From stock of G. F. Doughton, Moorestown. Sampled and sent by John S. Collins, Moorestown. Condition very good.

43. Fine Bone Dust, manufactured at Peter Cooper's Glue Factory, 17 Burling Slip, N. Y. Sampled and sent by John Wilson, Middlebush.

Various.

FACTS AND OPINIONS.

DON'T kill that toad, my boy; like he looks an idle tramp, but is in reality attending closely to business and earns his board and clothes as honestly as you, and doesn't disturb the melon patches either.

Somebody claims to have produced a thrifty plant from a blackberry seed found in the stomach of a man buried one hundred years. I have seen Canada Thistles spring up thickly, without delay, in muck hoisted from the bottom of a bed ten feet deep. Let us not say farewell to the seeds of foul weeds that we plow under; we will soon see them again in another form.

Cyrus Dicks labored harder than any farmer in town all day blustering about the farm, all night borrowing money to carry himself through the next day. He began to shingle his house, and built a cumbersome scaffold on all sides, which was standing five years afterwards, with bunches of shingles unopened, and the roof still leaking. Gates were purchased, but never hung. Cattle browsed in the grain fields. Barn doors hung on one hinge. Forlorn children skulked about the apology for a home. The patient wife had long since been buried. When a man discovers that he lacks brains he had better give up farming. Cyrus might have succeeded in a grocery or a factory, as President of an insurance company, or a member of Congress.

Monroe Co., N. Y. CHARLES. A. GREEN.

The Black Rat of our Ancestors.

Seeing the article on this subject in the RURAL NEW-YORKER of July 14, it may perhaps be of some interest to your readers to know that this animal still exists in my house and premises. How he has escaped the almost universal fate which has overtaken his brethren I cannot say. He receives no protection from me, but is killed in common with the other rats. I am told that the number of brown rats killed greatly exceeds the number of black rats. Occasionally one has been caught alive to furnish a specimen for a naturalist. My house is very old, having been built in the reign of Edward IV., and it is evident that in the recesses of this rambling old place the black rat has managed to hold his own against the modern intruder. I have been told that a few are to be found in one of the old breweries in Loudon, but, with these exceptions, as far as I know, the rat of our ancestors has ceased to exist in this country.

Rothamsted, St. Albans, Eng. J. B. LAWES.

RURAL SPECIAL REPORTS.

CANADA, Ilderton, Ont., Aug. 10.—The weather being favorable the harvest will be finished this week, and as considerable grain has been thrashed, we are in a position to form some estimate of the result of the season of 1880 from an agricultural stand-point for this section of the Province. Fall wheat is yielding remarkably well—from 25 to 40 bushels per acre. The average will be 30 bushels or over. The varieties mostly grown are the Clawson and Scott—the latter is generally preferred, it being a very good millers' wheat as well as hardy and prolific, the only objection to it being the fault of shedding easily in harvesting if left until ripe. A large acreage will probably be sown this Fall. Of barley a smaller breadth was sown than usual and the continued rains at the time it was coming through the ground seemed to give such a check to the growth that the plant looked yellow and stunted and never fairly recovered. Taking the small acreage and light crop in connection with the dark and stained color of most samples it is fair to predict a good price for the best malting offerings. Oats are very heavy and badly lodged and twisted. I never remember seeing such long heavy straw, but I doubt whether the yield will be proportionate. The Australian or White Mane seems to be the favorite variety. Spring wheat is a complete failure. This last season will have about finished the growth of this grain in Western Ontario. Why our farmers would persist for the last three or four years in attempting to grow this crop only shows how hard it is to move the agriculturist out of a beaten track. It is doubtful if Spring wheat for the last three years has, on an average, yielded seven bushels per acre. Of peas all that can be said is "Ichabod"—scarcely any sown. The bug has been so bad that our county councils are petitioning the Legislature to prohibit the growth of this legume for two or three years. Formerly it was one of our most profitable crops, not alone for its feeding properties, but more as being such an excellent preparatory crop for Fall wheat. The hay crop was large though much was spoiled by the continued rains at the time of cutting. This moisture helped the pastures considerably, though not the cattle grazing thereon. As a rule, steers (of which large numbers are grazed in this vicinity) have done badly and so have lambs; they are large enough but poor. The butchers inform me they have scarcely seen a fat lamb this season; sheep can endure any amount of cold, but can't thrive when their fleeces are saturated with wet. Roots are larger and better at this time of year than I ever knew, where the weeds have been kept down and thinning done at the proper season; but it has been a hard fight; the rains of the Spring and early Summer were

just what the weeds delighted in and the growth they made in a few weeks, where neglected, was sufficient to smother out any cultivated crop. As a whole the season of 1880 will be remembered as affording us crops above an average and as a season of encouragement to the farmer. R. G.

CANADA, Fernhill, Ont., August 6.—Except a few patches of oats everything has been harvested. Never was the harvest here got through in so short a time. Wheat is turning out extra-good in this and the other adjoining townships. A great deal of Winter wheat will be sown here this Fall. Wheat and stock-raising seem to pay best. There isn't much corn raised here, and no sorghum is grown. We raise only a small quantity of carrots or mangels, and not many beans. Peas are a good crop. Our seed is good, as we are careful not to use buggy peas. Summer-fallowing is practiced here with good results. We obtain better crops after it and it cleans the ground of all kinds of weeds; yet one of my neighbors never made a bit of summer-fallow in his life, still he always has good crops. This is the third year in which steam thrashing has been practiced in this part of the world—nearly all the old horse-powers have been thrown aside. J. M. W.

ILL., Ludlow, Champaign Co., Aug. 13.—The first half of July was notable for high temperature. On the 10th there was a heavy rain, which is the last of any account up to the present time. Since the middle of the month the temperature has averaged low for the time of year, with cool breezes and cool nights, fine for harvest work. Hay was saved in good condition and yielded about one ton per acre of good quality, and in this locality it is mostly of clear Timothy; a good deal has been saved for seed. Oats had lodged somewhat; the yield will measure well but will weigh light. Flaxseed was good, yielding from eight to 12 bushels of seed per acre. Thrashing is being rapidly finished. The self-propelling steam engine is the favorite power for thrashing. It is getting very dry for corn, and without rain soon late corn must be a light crop. Early corn would have been very good with timely rains, and will still make a fair crop; it is beginning to harden. Early potatoes are very good; late ones have been injured by dry weather and the blister beetle. No Colorado beetles have made their appearance this year here. Corn is worth 28 cents; oats, 18 cents; potatoes, 30 to 35 cents; apples, 45 cents; hogs, $4 50 to $4.75. There is a good demand for young cattle; calves four months old are worth $15 per head. Butter is selling at 12 to 15 cents per pound; chickens, $2.00 per doz. "G."

ILL., Naples, Scott Co., Aug. 9.—The weather here is very dry—no rain since July 2. The corn crop looked well up to the middle of July, but the dry and hot weather has about burned it up. The wheat crop this year in bushels is the largest ever grown, but the quality is not so good as last year. E. M.

ILL., Champaign, Champaign Co., Aug. 15.—We have a severe drought and need rain badly, which I hope we will get soon, and I think we shall, because it has showered south and showers usually work north, that is this way. B. F. J.

MICH, North Branch, Lapeer Co., Aug. 11.—The wheat crop is being rapidly thrashed out in this county. Steam thrashers are in operation in every direction, which do the work fast and well. One in eleven hours thrashed fifty acres of wheat with big straw, which yielded 917 bushels. It is not yielding as well as it was thought it would do before harvest, The weather was very rainy during the whole of the wheat harvest, therefore much of it was wasted in handling. Then again, some fields grew badly. I think there will be as much wheat in the county as there was last year. The number of acres harvested in 1879 was 40,420 which averaged 18 37 bushels per acre. According to the supervisor's returns there were 46,200 acres to harvest this year, but the average yield will undoubtedly be lower. Oats are heavy but badly rusted. Corn is doing well now. Potatoes are rotting in some localities. Fruits of nearly all kinds are very plentiful. Wild blackberries are so abundant that they are being sold at two cents per quart. In regard to fruit, this is surely a very favorable season for those on new farms, who have not yet had sufficient time to grow it. D. W. C.

MICH., Cleon, Manistee Co., August 9.—Crops of all kinds are good here—so good that I hear some asking, "What shall we do with the surplus?" They think there will be no sale for much of it at any price. Both Winter and Spring wheats are raised here; Winter generally does the best. It is now harvested and many have thrashed. It will average 15 bushels to the acre. Clawson and Diehl for Winter and Canada Club and Golden Drop for Spring are mostly raised. We had much rain in July, and considerable damage was done to hay and a few fields of wheat sprouted, because, having too much to do for the amount of help to be had, the wheat could not be cut at the proper time and in a proper manner. Wild berries of nearly all kinds are very plentiful this and nearly every year. Young orchards are coming into bearing. Apples, plums, cherries and the hardy kinds of grapes do well. Peach trees in the neighborhood bore well last season and this. J. S. G.

MICH., Ovid, Clinton Co.—Crops are looking well here. We have had plenty of rain this Summer. Fruits will be plentiful; but wheat is much poorer than was expected before the yield was tested by thrashing. M. A. S.

N. Y., Pitcher, Chenango Co., Aug. 16.—Take the season through, we have had dry weather, except a little while in July, when the weather was "catching." Prospects for Fall crops are not as promising as they were some weeks ago. If this community ever suffered more in one season with swarms of grasshoppers than they have this Summer, I have failed to find any old settler that could tell when. It seems almost impossible to shade the picture enough. The hay crop is reduced about one half, and although there was a heavy growth of oats, and prospects were never better than a few weeks ago, still the plague of grasshoppers has cut off a large percentage, a great many pieces being cut green which never will be thrashed. Many pieces of corn were cut as soon as the ears had fairly commenced growing. Fruit trees in many places have been stripped of their leaves, and hard Winter apples have been partly eaten. Many farmers in this valley are buying corn from Syracuse, by the car load, and are feeding cows now. Potatoes bid fair to be a fair crop, though but few are dug as yet. Apple trees are loaded to the fullest extent—the largest crop, I think, I ever saw. There is but very little wheat grown in this section. Farmers are selling good young dairy cows from $10 to $15 each. Butter crop will be very much reduced in quantity in this section. L. W. S.

N. Y., Royalton, Niagara Co., Aug. 11.—Wheat, oats and barley are good. Corn and potatoes are growing finely. There will be a good many apples, pears, plums, grapes and peaches in this county. Blackberries, strawberries and raspberries were very good and plentiful in their season. There were also cherries of several varieties; in fact, there is seldom any lack of fruit here, as this is a noted fruit county. The Beauty of Hebron is a first-rate potato, but not much earlier than Early Rose with us. Mold's Ennobled Oats yielded splendidly, but rusted badly. They and the cow-peas (which are growing luxuriantly and full of blossom and pods) were sown in the garden, and manured with rotted barn-yard manure and phosphate. The mangels are flourishing. None of the flower seeds germinated, excepting the aquileglas, which are growing nicely. A. S. B.

OHIO, Pitchville, Huron Co., Aug. 9.—We practice mixed husbandry here. Crops of all kinds are good; wheat good; oats fair; corn very good; potatoes good; stock of all kinds look well, and there is plenty of feed for even a long, cold winter. H. C. M.

TEXAS, Waco, McLennan Co., Aug. 6.—Cotton picking has commenced to a limited extent, but it will not become general for ten days or two weeks. During the latter part of July and up to the present we have had a superabundance of rain, and many fears were expressed that cotton worms would be the result, but the fears seem to have subsided with the rapid maturing of the cotton and continued absence of worms. This seems to have been the most remarkably seasonable year in Texas for a long time, and if no severe casualties occur to the crops from now forward, there will not be forces enough within the State to gather and save what has been made. I see it stated in some of the State papers that many counties are already preparing to send to Kansas and elsewhere for hands to pick the cotton. The corn crop is matured and ready for housing, and it is simply immense. A. S. S.

WASH. TER., Walla-Walla, Walla-Walla Co., August 5th.—This season has been dry and crops of all kinds are light. Grass-hoppers have been here for the first time, and they have done some damage in places—principally to gardens. White Club Wheat is grown here by everybody, and is sown any time. Fall-sowed wheat, with a good season, will produce 40 to 50 bushels per acre; Spring-sowed, 20 to 30 bushels. Last year we exported about 50,000 tons; this year we shall probably have not more than half that amount. Oats and barley yield well; but are only raised for home consumption. We have no use for rye. Corn does not do well. Potatoes and all vegetables do finely; usually we have a large surplus. Sorghum is not raised to any extent though it will grow very well. Fruits of all kinds do well. All the favorites of the Northern States are grown here—only there are no worms or diseases to hurt fruit here. The Winters are generally warm so that a severe frost will injure fruit here more than in colder climates, and this is the only trouble we have with fruit. J. F. W.

WISCONSIN, Bellefontaine, Columbia Co., August 9th.—Crops hereabouts are fair. Wheat is not quite an average. Oats are heavy. Early Amber Cane is grown quite extensively, and forms an important item in our farm products. Hay is short of an average crop. All roots and vegetables are good. H. F. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Velvet Grass as Fodder.

B. J. A., Cornwallis, Oregon, referring to that one of our "Brevities" in issue of July 3, which says:—"There are few grasses which are prettier in bloom than Holcus lanatus (Velvet Grass); it is a pity it is not as valuable for lawns or for cattle as it is beautiful and tenacious of life," inquires why Velvet Grass is not valuable for cattle.

ANS.—Comparing Holcus lanatus (Soft Meadow or Velvet Grass) with Timothy and Orchard Grass, we have:

	Albuminoids.	Fatty Matter.	Heating-Starch, &c.	Woody Fiber.
Holcus	11.52	3.56	39.25	39.30
Timothy	11.35	3.55	53.35	26.45
Orchard Grass	13.53	3.14	44.32	33.70

Stock are not particularly fond of it. It is too coarse and rampant for lawns, soon taking possession of the soil.

Hay Sheds.

J. M., Richmond, Ind., intending to put from 100 to 200 acres under Timothy for hay for market, asks what would be the best sort of sheds for preserving it, and the best kind of presses.

ANS.—For 100 to 200 acres of Timothy for hay the sheds should have a capacity for 400 or 500 tons, which would require about 400,000 cubic feet. A shed 100 feet long, 25 feet wide, and 20 feet high would hold about 70 tons of new hay, and it would be most convenient to build these in different parts of the farm: for instance, one on each 40 acres. It would be easier to take the hay press to the hay than to bring the loose hay to the sheds. There are several kinds of hay presses made, but those which bind with wire and use no sticks are to be preferred. The sheds may be made as follows: Posts of sufficient size and strength are planted in the ground, or mortised into blocks sunk into the ground; plates and cross-beams are fitted to the posts to support the roof. To prevent the side thrust against the posts of a large mass of hay as it settles, it would be best to support the roof upon truss beams which would hold the plates from being pressed out. A suitable form of truss may be made of plank 2x6, as shown in the drawing below. The beam is made of two pieces bolted together, so that it is four inches thick; or it

BARN TRUSS.—FIG. 275.

may be made of shorter pieces spliced and fastened with iron bolts, if long strips of 25 or 27 feet could not be procured. The whole is put together with bolts, and a strap of iron is bolted to both post plate and roof truss to hold the whole together and prevent spreading. The roof may be made of boards nailed to laths laid upon girths from one rafter to another, and if the boards are quite dry when used, the joints will need no covering, as the water will run down the edges and off from the eaves, and not pass through the close joints. Sheds of this kind may be made of any desired length, and may be added to at any time at either end by putting up more posts and roof. There is a sheet-iron roof which is much lighter and greatly more durable than boards which can be procured, and this is absolutely water-proof. No walls are required, and it is obvious that the wider the eaves the more hay the roof will cover. The truss is stiffened and strengthened by the three struts shown, and a few spikes may be used in addition to the bolts, to fasten the timbers together. Braces of plank (2x6) may be used to connect the trusses which rest over the posts to the latter, to make the shed stiffer when it is empty, and when exposed to the force of the winds. The cost of such hay sheds will be paid in a few years by the saving of hay that would be damaged if it were stacked.

Strawberries from Seeds.

V. R. H., Rylersville, N. Y., says:—"One year ago I saved some seed and sowed it in the nicest place in my garden, but no plants came up. I sowed the seed as I would onion seed, only that I did not cover it so deeply. The past Spring I thought surely I would hit the mark by sowing the seed in my hot-bed in drills, the same as tomatoes, etc., but I got no plants. Not discouraged yet, on the first of July I sowed more seed in two tin pans. I leveled the top smooth and sprinkled my seed on and covered it with a piece of old factory, did not put any dirt on the seed and kept it partly in the shade and watered well by pouring water on the cloth. The result I have so long looked for came at last. I have perhaps 500 or 1,000 plants, with leaves about the size of an old three-cent silver piece. So much for perseverance." And our friend asks how to treat the plants until Spring.

ANS.—Set them out in the open ground at once. Some will bear next year—all the year after. You should note those which grow feebly, those which sun-scald, those which bear pistils only. The first and second class may be cast out as not adapted to your location. The others, of course, would not fruit unless in close proximity to kinds bearing perfect flowers that bloom at the same time.

Blue Stem Wheat.

M. D. B., Bennett's Mill, Va, asks whether there is a variety of wheat called Blue Stem; if so, whether it is a Winter or Spring sort, and where it can be purchased for seed.

ANS.—Yes, there is a variety of wheat called Blue Stem, as might have been seen from its name occurring often in our crop reports. It is known by many different local names, such as Purple Straw, Flint, New York Flint, Durst, Gennessee, etc. It is a Winter wheat, with white chaff and smooth head. The straw is tall, but stands well. Near the head it is blue, hence the name. The grain is short, but plump, with very thin skin. The flour is of the very best quality, and the wheat always commands a good price. It is late, however, and, like all late wheats, liable to rust. It originated in Virginia, was thence taken to Pennsylvania, and again propagated throughout the South, frequently under the name of Pennsylvania Blue Stem. Any large seedsman in Richmond, Washington, or Baltimore should be able to supply seed.

Queries about Peach Trees.

O. S. B., Burdett, N. Y., asks, 1, are seedling peach trees hardier and better bearers than budded trees; 2, which are the hardiest and most profitable of the budded sorts; 3, what causes the leaves of some kinds of trees to curl up badly, and what is the remedy; 4, the leaves of some of his peaches turn yellow one year, and next year the trees usually die, and he inquires whether this disease is "the yellows."

ANS.—1, Not necessarily. 2, See separate answer next week. 3, It is thought to be a small, internal fungus. The remedy is a strong growth induced by good soil and cultivation. 4, Yes, the disease is very contagious and sooner or later the second tree would show the same disease.

Miscellaneous.

B. F. T., Cloverdale, Kan., being greatly troubled with asthma, and noticing in the RURAL the advertisement of Drs. Starkey and Palen asks whether we think the compound oxygen treatment they recommend, worthy of a trial.

ANS.—In our Southern trip last Spring we met three persons at Aiken, S. C., who were using the above remedy for weak lungs. They spoke of it as having benefited them. We should not care to advise in such matters. We believe the gentlemen to be entirely respectable. The writer of this has had at odd times asthma (or emphyzema, which is nearly the same) for years. He has taken all sorts of medicines and received attendance from not less than six doctors—all without any permanent benefit. He has experienced *relief* by the use of one remedy only, viz: a powder the smoke of which is inhaled after the powder is ignited. It is sold by many druggists under the name of Himrod's Asthma Remedy. We do not know Himrod, or that any such person exists. It is a downright "quack medicine," but we have more than once blessed it, when, during paroxysms of hard breathing, this has afforded relief in five minutes, in consideration of which we freely give Himrod, whoever he may be, this bit of *free* advertising,

L. R., Paris, N. Y. No. 3 is Clehorium Intybus. No. 5, is probably a Pyrethrum—not worthy of cultivation. No. 7 is Panicum sanguinale, common Crab or Finger Grass.

No. Hibiscus Moscheutos needs no protection. This is herbaceous. H. Syriacus is sometimes harmed. But we have never known it to be killed by winter. We have no experience with the other Hibiscus mentioned. Iris Lævigata is hardy. Glad you have succeeded in raising plants. It is a charming flower at its worst. There is no telling when the magnolia seeds may germinate—possibly a year hence. We regret having placed them in our Distribution. The Ipomœa leptophylla seeds should germinate in less than a month.

O. S. B., Schuyler, Co., N. Y., asks which are the hardiest and most prolific varieties of peaches for that section.

ANS.—For Southern central New York, to give a succession running through the usual peach season, we would recommend Mountain Rose, Early Crawford, Foster, Richmond, Old Mixon Free, Jacques' Rareripe, Stump the World, Late Crawford (on heavy soils), Hill's Chilli, and Smock Free. We assume that they are to be planted for market. If for home use our selection would be quite different.

H. E. B., Auburn, N. Y., has an apple graft one year old, that bore seven large apples this season. The graft is about 18 inches long, and our friend asks whether it is likely the bearing of fruit so early will injure the graft. Three other grafts of the same age bore three apples each.

ANS.—So much weight is liable to break the clon where it joins the stock. Probably they will bear sparsely for several years to come.

J. T. H., Tabo, Mo., asks, 1. the best and cheapest way of preventing ants from troubling flowers and plants; 2 the best and cheapest manure for flowers and house plants.

ANS —1. Flooding their holes with lime or carbolic water. 2. The liquid manure from the barn-yard so diluted that it is hardly colored.

R. M. T., Philippi, W. Va., asks whether lightning rods are of any real utility in preventing a house from being struck by lightning.

ANS.—See Mr. Rufus Mason's article on lightning rods elsewhere in this issue, and the remarks thereon.

J. L. E., Fulton, Mo., having a large artificial pond between his house and barn, asks what kind of plants would give it the most ornamental appearance.

ANS.—Something would depend upon the elevation of the banks of the pond above the water. Alders, the Laurifolia Willow (Salix pentandra), Rose of Sharon (Hibiscus Syriacus), Clethra alnifolia, most of the maples, liquidambar, Amorpha fruticosa and Lewisii, Ligustrum ovalifolium (California Privet), Yucca filamentosa, Azalea viscosa and nudiflora, High Blueberry and Black Huckleberry, elder, Iron-weed, Boneset, Aralia spinosa, Snow-drop Tree, Hibiscus militaris, dog-woods. There are hundreds of herbaceous plants suited to such a place, as Closed Blue Gentian, dog-tooth Violet, Lilium superbum, that would greatly add to the interest of such plantations. Such lake-bands are, indeed, the most suitable for "wild gardens." Among evergreens, we may mention the American arbor-vitæ, hemlock, cypress, Norway Spruce, and even Scotch and Austrian Pines. We have had such pines growing beside our own lake. They flourish admirably though suited also to the highest, sandiest locations.

J. W. S., Owensboro Ky., says that timber being scarce in that section, farmers are investigating the merits of barbed wire fence, and he asks what is our experience with that sort of fence; is it economical, and whether we know of any animals being seriously injured by its use.

ANS.—We have had no personal experience with wire fences; but a good deal has been said about them in the RURAL by those who have used them. We know of no cases in which an animal was crippled by contact with such fences; though we do know a few cases in which animals were hurt.

E. P. R., Reading Pa., and several others ask whether the American Book Exchange of this city is reliable.

ANS —So far as we now the firm is quite trustworthy and is filling all orders as rapidly as possible. Their sales, however, we are told, are so heavy that occasionally a slight delay is inevitable in sending the works ordered; but we are assured that the orders will be filled in due time.

I. W. C., Big Rapids Mich., asks what would be the price of a hand-power cider press.

ANS.—The Higganum M'f'g Co., Higganum, Conn., sell good presses of the sort for from $15 to $25.

M. F. McC., Darlington, Pa., sends plant for name.

ANS.—Ensienia albida. It belongs to the Milkweed Family.

COMMUNICATIONS received for the week ending Saturday, August 21.

Miscellaneous.

WHAT OTHERS SAY.

SORGHUM SUGAR-MAKING.

THE Elmira Farmers' Club discussed sugar-making at their last meeting and we make extracts from the most important part of the proceedings as reported in the Husbandman:

Mr. McKeel of Cayuga. At what stage of growth do you cut corn stalks to get the best results in sugar?

C. J. Reynolds. When the ears are nearly matured. Before they are dead-ripe and the stalks dry, of course, but when the grain is fully formed and so far advanced that it will ripen on the severed stalk.

Mr. McKeel. I suppose the right time to cut sweet corn, is when the ears are ripe enough to pluck for drying?

C. J. Reynolds. Yes, although the exact condition can be ascertained only by experiment. We shall know better about it when we are more familiar with all branches of the work. The time to cut Amber Cane is when the seed is black—when it is in the dough state. That is as near as we can now indicate the time when the juice will work into the greatest amount of sugar.

N. L. Higgins. Have you made any sugar?

C. J. Reynolds. Yes, the crude raw sugar—not in large quantities, but enough to show that only skill is required to get the sugar out of the juice. I had a barrel of molasses boiled down to nearly twelve pounds set away in my cellar, and there are now several inches of sugar at the bottom.

Ezra Loomis, of Bradford Co., Pa., Can you use anything more than the stalks—the leaves or tops?

C. J. Reynolds. Only the clean stalks are available. We shall try coarse alum this year to aid crystallization. Mr. Stewart's process was a great gain no doubt, but he has changed it somewhat I understand in the hope of making improvement. He uses now a solid compound more easily managed than his liquid preparation.

N. L. Higgins. Has alum been used for this purpose; and if so, to what extent?

C. J. Reynolds. It has been used at the West, but I do not know how much. Those who have used it say it leaves the sirup in better condition for crystallization, and that is a material gain if true.

N. L. Higgins. In your experience has the stripping of the leaves from the stalk been attended by any other advantage than reducing the amount of coarse material passed between the rollers?

C. J. Reynolds. Certainly; they are worthless for sugar-making, and would injure the products. The way to strip them is to pass along the rows and strike the leaves off with a light lath, making quick downward strokes. The tops can be separated best at the time of loading on the wagon. This should be done with a sharp knife to make the work easy. They should be cut six or eight inches below the seed. There is another precaution to be observed in the work. If the stalks can not be worked within forty-eight hours after they are cut they should be inverted, for standing on the top ends the tendency to oxidization of the juice in the butts is lessened. In cutting I would be careful to sever the stalks a few inches above ground.

Mr. McKeel. Why not cut at the ground and get the whole?

C. J. Reynolds. There is more earthy matter in the lower portions of the stalks, and this gives a hurtful flavor to the juice. For this reason the lower joint should be left as worthless. So with the tops, they are not worth working, for there is not only less juice in the stalks near the tops, but the juice is not so good as in the body below.

Samuel Hall. Is the refuse after passing the crusher good for anything as cattle food?

C. J. Reynolds. I think not. We have never had stock that would eat it. The leaves are excellent as fodder, and they make up an important item to the credit of the crop. I am speaking now of Amber Cane. It is possible that crushed corn-stalks might be eaten by cattle, but as I have had no observation in the case, I cannot say whether they have value or not. Now is a good time to remove the suckers, a very important matter, for after suckering the stalks grow stronger and work up with more profit.

Ezra Loomis. You think it necessary that the stalks should be worked within forty-eight hours of the cutting?

C. J. Reynolds. Yes, by all means, if possible.

President McCann. Has the seed of Amber Cane any value for feeding to cattle?

C. J. Reynolds. Yes, it makes good food when ground.

Mr. Goddard, of Bradford Co, Pa. How much good syrup do you expect to get from a ton of stripped cane?

C. J. Reynolds. Forty, or forty-five gallons of sirup weighing eleven pounds.

Mr. Goddard. What is the estimated cost of manufacturing after the machinery is on hand?

C. J. Reynolds. That question I cannot answer for I have not advanced so far in the business as to gather up details of information embracing the cost as applied to such quantities as should be worked to give profit. A cord of good, hard, dry wood will reduce two hundred and fifty gallons of juice to dense sirup.

Ezra Loomis. You would run the evaporating pans night and day, I suppose, when there is enough cane to keep them employed.

C. J. Reynolds. Yes. The pans we have will reduce about four hundred gallons of juice in a day and night, making, say, eighty gallons of molasses.

STEAM CULTIVATION.—We have made mighty strides in steam cultivation since the first Carlisle meeting of 1855, says the London Chronicle, but we think it is a happy coincidence that the second Carlisle show has made of steam cultivation almost as prominent a feature as was bestowed on the former occasion. In fact, we have taken a new departure, and on the silver medal by the Society being presented to Messrs. M'Laren for their improved Darby digger, we have the promise of tilling being conducted more in future on the principle of Mr. Hoskyns. He pointed out that the mole, by the action of its claws and the fine mold left behind, affords an example for the imitation of the steam cultivator. Mr. Darby, of Chelmsford, a few years since, went out of the usual track in devising a steam digger, which works more according to this principle than any other of the steam cultivators previously devised.

To whatever extent the Darby digger may be improved, we think Mr. Bailey Denton a little too sanguine in hinting at the bare possibility of British farmers being enabled through its aid to get over their difficulties, and compete successfully with the occupiers of virgin soils on the other side of the Atlantic. We cannot forget that in whatever degree this or any other improved appliance of a mechanical nature may enable us in England to decrease the cost of production, the same appliances are open for adoption to foreign and colonial agriculturists, who, in addition, have unbounded, resources in free, untaxed land.

SILK-WORM RAISING IN PENNSYLVANIA.—The Philadelphia Press, as we learn by the Prairie Farmer, is authority for the statement that about 60,000 silk-worms are at work on the farm of Frank Graff, in Birmingham, Delaware county, Pa. The worms are in charge of a young lady living at Mr. Graff's. When the eggs are hatched the creatures are as fine as a hair, and have to be lifted around with a camel's hair brush. But they are voracious feeders, and it is no light task to keep them supplied with mulberry leaves. Their growth is very rapid, in six weeks' time reaching their full size, nearly three inches. When the whole herd is engaged in feeding, the noise made by them is like rain falling on a roof. While feeding the worm is of a light green color and as soft as velvet to the touch. Along the body are nine small breathing holes. The insects have strong, serrated jaws which soon make their way through a leaf. The silk while in the worm is a gum which is exuded in two strands. These unite and form one thread of silk. The worm in starting its cocoon first makes an outer covering of floss silk. Within this they spin the silk, bending the head and body up and down and crossing to every side, entirely surrounding the body as a protection against wind and cold. The intention of the insect is to make a covering for itself, and it has little thought of the tens of thousands of gayly dressed women for whom it is weaving rich and durable attire. The cocoon made, the worm passes into a chrysalis state and comes forth a moth fly to lay eggs and die. If the silk grower wants the eggs he allows the insect to go through all these stages, but if he wants the silk, he chokes the worm while in the chrysalis state, for if it is allowed to eat its way out the thread of the silk is broken and valueless. The chrysalis is killed by heating it over a fire, or throwing it into boiling water.

A CORRESPONDENT of the Mark Lane Express (London) makes comments upon our last crop number, from which we take the following:

"A special number of the RURAL NEW-YORKER, filled with crop reports, came into my hands the other day. It gives, to begin with, nearly a column of headings, generally of the most startlingly sanguine description. 'Wheat a splendid crop, the largest ever produced! Ohio, Indiana, Minnesota, Illinois, New York foremost. Kansas disappointed. Corn (maize) an immense crop, the heaviest ever raised. Oats, a fine crop everywhere. Barley probably 50,000,000 bushels. Rye, good everywhere;' and so on. The reports themselves do not seem to me fully to bear out these 'booming' announcements."

As "startling" as were the headings, we think that results are showing that they were in the main quite to be trusted, and as for the reports not bearing out the "headings," we know that our critic is mistaken, inasmuch as all the reports were thoroughly analyzed under the three different headings of "good," "middling," "bad," and the result honestly summarized in our headings and editorial.

I AM more and more convinced, as my years increase, says Mr. Mechi, of England, that my war against excess of fences and trees is a just one, and still greatly needed, and, in fact, indispensably needful now we have, as agriculturists, to compete with every foreign source of food supply.

THE BIG HORSE.—Our trans-Atlantic cousins are nothing if not great in everything, says the London Live stock Journal. But there is no denying the fact that the perception of the modern Yankee is keen, and that he possesses the perseverance necessary for experimenting upon a "notion." He talks "tall," and loves to do "tall" things; and the love of praise is as great with him as of the "almighty dollar." The American breeder has improved on the Short-horn, the Hereford, the Ayrshire, the Jersey and the Holstein breeds of cattle, not to mention his efforts in the ovine and porcine families. But he has conceived a new idea, and there is no doubt it (his latest creation in the equine species) "licks creation"—if true. The Norman-Percheron is in great favor in the States, but the stock-breeders' love is divided. Some prefer the Clydesdale for draft and agricultural work; but a new horse has turned up which puts all other dray-horses out of court. The big thing this time is a big cart-horse, standing 20 hands one inch high (or 81 inches), and is said to weigh about 3,500 pounds. It is said he was bred in Ohio from native stock, and is well proportioned and healthy, English horse-breeders must therefore look to their laurels, or the Yankees will be getting as high prices for their draft-horses as they do for their Short-horns.

"Now, with regard to Alsike Clover," says a writer in the Germantown Telegraph, "I can say that I have as fine a stand as I ever saw on upland now in bloom, and my bees are on it by thousands gathering the rich nectar so abundantly furnished them in this, one of Nature's richest honey-plants. And now, while I am writing, my Italian bees, as well as my neighbors' bees of the native or black race, are working on the Alsike Clover by thousands, and storing honey of the richest quality quite rapidly."

A QUEER DECISION.—Judge Biddle, of the Philadelphia courts, has decided that a retail dealer who sells oleomargarine need not deliver a label with it stating that the compound is oleomargarine, adding that the intention of the Legislature in using the words "stamped, marked or labeled," in the act regulating the sale of oleomargarine, was only to affect wholesale dealers.

CATALPA.—The seeds came from the Department of Agriculture at Washington. Since writing his report Prof. Beal says the trees have twice borne fruit and prove to be the hardy species or variety. Since they came up and have made their present growth they have passed through two of the severest Winters, when the mercury went 32 and 33 degrees below zero. They were once killed back a little, but at present they seem healthy.

[Young trees of this Catalpa (speciosa) have stood 15 degrees below zero at the Rural Grounds without any harm.—EDS.]

EARLY AND LATE SOWING OF WHEAT.—The farm manager of the Ohio State University writes to the Ohio Practical Farmer as follows: "In the wheat crop of '79 we commenced a series of experiments designed to ascertain the proper time for sowing wheat in this neighborhood. Five sowings were made on bottom land, one each on the 9th, 16th, 23d and 30th of September and 7th of October, in plats two rods wide by 40 long, containing one-half acre each. The variety of wheat used was Clawson, and it was sown at the rate of six pecks per acre. The result was as follows:

That sown Sept. 9 yielded	33 2-10 bush. per acre
That sown Sept. 16 yielded	30 5-10 " "
That sown Sept. 24 yielded	38 4-10 " "
That sown Sept 30 yielded	32 7-10 " "
That sown Oct. 7 yielded	26 2-10 " "

The first two sowings were perceptibly injured by the fly. These experiments were continued in the crop of 1880, by making ten sowings on the same dates as those of 1879. The variety of wheat used was Silver Chaff, sown at the same rate per acre as before. The result was as follows:

That sown Sept. 9 yielded	32½ bush. per acre
That sown Sept. 16 yielded	33 " "
That sown Sept. 23 yielded	33½ " "
That sown Sept. 30 yielded	29½ " "
That sown Oct. 7 yielded	26½ " "

In this we found no indication of the fly.

HORSE TROTS AND AGRICULTURAL FAIRS.—Mr. Alexander Hyde has the following to say on this topic: We hear farmers sometimes complaining of our agricultural fairs, and refusing to attend them because they are managed by horse jockeys and have degenerated into agricultural horse-trots. There are some societies of which this complaint is too true, but there are others whose fairs are conducted by farmers, and the horse is given a just proportion of premiums on his merits as a horse, and not solely on his trotting powers. We dislike the betting, drinking and other concomitants of the race-course as much as any one, but if this evil has crept into any society it is the duty of farmers to attend the annual meetings and root it out. If they will turn out in force at these meetings, they will find themselves in the majority and can regulate things to their mind. If the experience of the past is any criterion by which we can judge of the future, a pure racing association cannot long be sustained. We have known a good many race-courses started, some of them in opposition to cattle shows and farmers, fairs, but we have never known one to flourish long. The fast men know that in order to succeed they must graft the racing on an agricultural fair, so as to give it character, just as a circus is attached to a menagerie. It is for the farmers themselves to say whether their fairs shall be run down by racing and pool-selling. Majorities rule, and there can be no question that if the farmers' are united and rally to the annual elections of the societies, as they do to the political elections, they will find themselves managers, not subordinates. In any event, it is not worth while to succumb without trial, and give up an institution to jockies which properly belongs to farmers.

BRIEFLETS.

MAJOR FREAS says:—"A number of dwarf pear trees now in full bearing and in good health, growing in his grounds, were planted in 1847, when they were not less than three years old. The dwarf Tyson is his best pear except the Seckel..... W. F. Brown, it appears, has also tried Mr. Gregory's Marblehead Sweet-corn. He tells the Ohio Farmer that it proved to be "the earliest of all, being ready for the table in nine weeks from planting." Our report was 61 days.....We have had more potato beetles this season than ever before..... In all of Prof. Beal's experiments with root-pruning corn, wheat, etc., the results were a diminished yield—while the plants were checked in growth..... Prof. Husman, in the Rural World, in a reply to Mr. J. J. Thomas who is opposed to the use of wine in any form or quantity, says: "We have no right to forbid its moderate use to those who feel themselves refreshed and invigorated by an occasional glass." But it always invigorates and refreshes for the time. That is its dangerous quality. It is that which, as soon as the effects of one glass pass away, induces people to drink a second and a third. It is that, in short, which leads those to drunkenness who cannot control their appetites. ..... It is about time to bud peach trees. Have you any sound, young peach trees about your homes that bear poor fruit? A little trouble now may change the poor fruit to the best that grows in your neighborhood. .....The Minnesota State Fair to be held at Minneapolis, September 6, offers over $3,000 to be divided among Jerseys, Holsteins, Herefords and Short-horns. Between Percherons and Clydesdales, over $1,000 will be distributed in premiums.....A correspondent of the London Gazette says that he sowed this Spring two beds of onions, each eight yards long by one wide. On this ground, immediately before sowing, he dug in at least 15 cwt. of unmixed poultry manure (as much as a strong mule could draw), and the onions now are looking magnificent. As this is over 200 tons to the acre, it is an exceptional dressing, and he owns he is himself surprised to find it did not kill the onions..... We learn from many of our Missouri correspondents that fruit of all kinds is thus early a glut in the market.....The political situation as described by an enlightened press: Hancock—is no better than he should be. Garfield—is a good deal worse than he ought to be. English—is several degrees removed from what he might be. Arthur—is where he ought not to be. The latest ticket out, and one which, although cavlare to the general, bids fair to become quite as popular as any other in the Presidential field is:—For President—General Indifference. For Vice-President—General Apathy.- Puck.....It is remarkable how smart a woman is discovered to be after her husband has been nominated for President.—Cincinnati Sat. Night ....The growers of pot-grown strawberry plants now present their announcements in our advertising columns ..... Mr. Munro, of Georgia, fattens his pigs on sweet potatoes.....A Maine fancier has a three-legged hen that can scratch her head and a flower bed at the same instant... ....Mr. Hovey, of Boston, tells the Gardeners' Chronicle, of England, of "the very great beauty" of his golden-leaved variety of Magnolia acuminata, some of the leaves being conspicuously yellow. It is more showy than any golden-leaved tree he knows of. It is an accidental seedling of the Cucumber Tree now about 10 feet high—vigorous and beautiful.....

SATURDAY, AUG. 28, 1880.

"THEY DUG THEIR GRAVES WITH THEIR TEETH."—This was long ago the declaration of an eminent physician in regard to the majority of those who die prematurely. Every observing physician of the present time is aware that there is a vast amount of disease which is the direct result of over-eating. Part of this over-eating, perhaps a large part, is pure gluttony; but there is a still larger proportion which is due to bad cooking. When our food is in great part indigestible, the unsatisfied craving for nutriment tends constantly to cause over-eating. The great bulk of the food thus taken into the stomach affords no support to the system. But it is not harmless. It cannot be digested, but it finds in the moisture, movement and warmth of the intestines all the conditions of rapid putrefaction, and this putrefaction, constantly going on within the body in contact with actively absorbent surfaces, is a most fertile cause of ill-health. Women who wish their husbands and children to live long and enjoy life should train themselves well in the science and art of cookery.

HOW TO INTEREST THE BOYS.

IT has been a subject of frequent discussion, how to interest the young folks in agriculture. Doubtless much of the importance given to this subject has been gratuitous and undeserved, for the natural succession of the young men to the farms and labors of their retiring fathers, does not seem to go by default, excepting in those places where there is nothing to be gained by the hardest labor but the hardest kind of a living from worn-out and infertile fields. From such farms the young men naturally enough escape to the fertile West, but upon those where fair industry returns a bountiful reward and every comfort surrounds the homestead, there the young men remain and continue the work which has been begun by their fathers. But there is a method of making farm life attractive to boys, and of interesting them so much in rural affairs, as to draw them to the farm again in mature life, it may be after years of absence while engaged in prosperous business in cities. Such a method has been put in practice by that exemplary institution known as the Elmira Farmers' Club. This club has offered prizes for the best plot of corn planted and tended wholly by boys under 16 years of age. The competition thus entered into by a large number of farmers' boys, has created unusual enthusiasm and may prove to be the turning point in forming the courses of their future lives. When boys of 16 attend a farmers' club as the most interested of visitors, it may be safe to set it down that those boys will be farmers, and probably good, solid, enterprising and successful ones. It is an example for the widest imitation. Boys become such men as they are made by the circumstances into which they are brought. It would be a fortunate thing for farmers, if there were more such exemplary farmers' clubs as that of Elmira.

AGRICULTURAL DISTRESS IN IRELAND.

THE effects of the recent distress among the tenant farmers in Ireland promise, or threaten, to reach much further than could have been expected. The result may be a radical change in the method of government in England at an earlier date than could have been thought possible before the late trouble fell upon that land of troubles, Ireland. A temporary relief from utter ruin through the enforced claims of the land-owners for rents due by impoverished and starving tenants, and from the danger of legal eviction from their homes, has miscarried by the rejection of a measure for that purpose in the House of Lords. The Lords are the chief land-owners, and they have selfishly claimed their rents, their "pound of flesh," as it may really have been in many cases, without abatement from the ruined tenants. In cases of non-payment the tenants are turned out of their poor cabins, and left homeless as well as penniless upon the world.

Happily we in free America have no adequate conception of the dismay and utter ruin which an eviction for non-payment of rent brings to the tenant and his helpless family. Mothers and children turned out of doors have perished by the wayside while the father has been vainly looking for shelter, and none but that of the grave has been found. Such occurrences, by no means infrequent, have created the bitterest feeling, not only in Ireland, but in England, and the effect will surely hasten the time when the inevitable destruction of a hereditary and aristocratic form of government will be accomplished. Every popular reform has been fought out by the people in the teeth of violent opposition by the House of Lords, and the revolutionary question "Of what good are the Lords, anyhow," has been heard in England before now; while now it has given place to threats of the destruction of this hereditary form of government which is antagonistic to popular reforms and popular interests.

FLYING ANTS.

THESE are a great nuisance in a house, but we do not know that they infest buildings except finished in a particular manner and standing on a sandy or light gravelly soil.

A few years ago the writer put up a cottage on sandy ground sloping to the south. The basement was a kitchen and cellar, open on this side, but walled up against the bank on the north, and partly on the east and west sides. Sleepers were laid on the ground for a floor, the space between them cemented, and then the whole boarded over with matched inch pine stuff. We did this to prevent mice or rats from getting into the rooms.

The second year after the cottage was built flying ants bred in great numbers, early in July, between the floor boards and cement, and as they could escape in no other manner into the open air, they eat their way up through the boards, and swarmed thickly over the whole kitchen, and so continued for nearly a month. We endured this for three Summers, thinking their breeding there only temporary; but finding it was to be continuous, we took out the board flooring, the sleepers between the cement, and the cement itself. We then cemented the space anew, let it dry well, laid new sleepers on this, and boarded over with new boards. This allowed plenty of room for future ants to escape from under the board floor, and we have not been troubled with them since. We cannot say whether they continue to breed there, as we do not see them now, but presume they do.

At the same time we erected the cottage we put up a barn near-by, also on a sandy soil. The underpinning of this is two feet high, which raises the floor that much with the thickness of the sleepers above the ground. Ants sometimes appear here, but, as there is plenty of room for them to escape into the open air, they only remain a few minutes on the floor, and then entirely disappear, flying off.

Twenty-six years ago we erected a large building for manufacturing purposes. The basement floor of this was laid precisely as the first was for our cottage, except that we used two-inch oak plank for the flooring, instead of inch pine boards, but the ground on which this stands has a mixture of clay in it, and either for this reason or some other, ants have never appeared there.

THE CHICAGO CORNER IN PORK.

FOR the last two or three weeks there has been a good deal of excitement in the Chicago pork market, the transactions in which greatly influence those in other cities also, the Western metropolis being far away the greatest hog-packing point in the world. The prices of mess pork, the supply of which is necessarily limited, have been steadily advancing there of late, not a little to the satisfaction of the farmers in the tributary territory, but much to the disgust of a number of dealers who had sold the commodity "short." The policy of an operator of this sort is to sell a product of which he has none on hand, to be delivered at a specified date at a fixed price, the transaction being based on the expectation that in the meanwhile he will be able to buy the goods at a lower price than that at which he has agreed to deliver them. It will, therefore, be readily seen that in the produce market the interests of the man who sells short, or of the "bear," are always inimical to those of the producer, inasmuch as the former's success depends on depression of prices, and that of the latter on their appreciation. The farmer's sympathy is, therefore, pretty certain to be on the side of the "bull" in all transactions of this sort.

Probably the largest "short" operator in the Chicago pork market is Asa Dow, who, some time back, sold 15,000 barrels of mess pork "short," at about $10 per barrel, and as the market advanced above this figure, he has been increasing his margins to meet the difference between the ruling rate and that at which he had bargained to deliver the pork. Early in the week pork reached the highest price of the season—$16.95 for September pork—and on Thursday Dow, acting doubtless in accord with other operators in the same plight, refused to "put up" any more margin, on the ground that the quoted price of pork was fictitious, the advance being due to the manipulations of a clique who had formed a "corner" in that commodity. It is estimated that there are not more than 150,000 barrels of pork in the Chicago market, while it seems probable that 400,000 barrels were sold "short," and as the prices at other centers have gone up in sympathy with those at Chicago, the "bears" are likely to be nipped severely, especially as the supply of mess pork is comparatively limited at other points, and the manipulations of the "corner" have most likely been extended to other centers also.

The chief engineers of the corner are Armour & Co., the largest pork packers in the country, and so extensive, it is said, is their control of the mess pork in the market that they can run up the prices almost indefinitely, and thus force the "bears" to pay them and the other members of the syndicate an exorbitant difference between the prices at which they sold "short" and those ruling at the time of settlement; for in such cases the goods sold are seldom delivered, the difference between the ruling price and that for which the goods were sold being generally paid instead. It would greatly help the bears if they were permitted to fill their contracts with summer-packed pork, but the keeping qualities of that are generally so unreliable that it is not considered "regular," and a proposition to make it so last Monday was voted down by a large majority of the Board.

Of course, transactions of this sort are of the same nature as gambling, and the losers never deserve and seldom receive much sympathy. Objectionable on this account as are such dealings in railway and other stocks, they are still more reprehensible in food, for in the latter case thousands in this and other lands suffer from the unscrupulous greed of these speculators. The reported losses of Mr. Keene and his associates on account of their late corner in wheat, will probably prevent others from entering upon so hopelessly large an undertaking as to obtain control of our vast wheat crop; and the lesson the "bears" are now getting in the pork market may have somewhat of the same salutary effect.

BREVITIES.

IT seems that the black rat of our ancestors still lives in the mansion of Dr. Lawes of Rothamsted England. See his note.

OUR engraving of Mr. M. B. Batcham is an excellent portrait. It was drawn from a card-photograph kindly furnished by Mrs. Batcham at our request.

MR. H. STEWART tells us of a cucumber which he has raised 30 inches long. The variety is that known as Gen. Grant. He says that in addition to this remarkable length of the fruit, the vines are very prolific. This is probably owing to a very favorable season. Our own experience with these long cucumbers has been that they are not worth cultivation.

MR. C. C. GEORGESON, a graduate of the Michigan Agricultural College, and for the past two years one of the editorial staff of the RURAL NEW-YORKER, has been elected to fill the chair of Professor of Agriculture in the Agricultural and Mechanical College at College Station, Texas. Only the friendliest relations existed between Mr. Georgeson and his associates of the RURAL Office, so that it is with all sincerity that we wish him a full measure of success in his new field of labor.

A WELL-KNOWN writer and nurseryman and a true friend to horticultural progress, writes us a letter from which we take the following note: "I note your editorial complimentary to F. L. Stewart, in last issue. But what did you think of Ohmer's article on the Gregg Raspberry in RURAL, Country Gentleman and Tribune all at the same time? This sort of thing has become such a fashion of late that I hesitate about writing anything for the press, for sometimes it is impossible to do so without commending something and laying myself liable to be charged with attempting to serve personal interests, a desire to avoid which is ever uppermost in my mind. I am glad to see you and Horticola are settling down to the facts on the *staminate* question, and regret my Jotting could not have appeared at the same time. It would not look so much like 'following suit.'"

THE gold wave which flowed in upon us to such an unprecedented extent last year, is again approaching a flood. Gold is pouring in upon us from foreign countries this year, although not to so large an amount as during 1879. With a large balance of exports over imports; with abundance in our barns and granaries and with gold coming from abroad and an enormous production from our mines, it certainly does seem as though the condition of the country should be satisfactory to the most exacting citizen.

A NOTED entomologist, referring to Mr. Marvin's articles on "Our Insect Enemies," in the last two issues of the RURAL, writes us:—"The subject is one of much importance and one in reference to which scientists differ widely, perhaps on account of the fact that so little is known about it. The articles may be useful in calling attention to the topic and in bringing out the observed facts and opinions of others. The idea of one man inoculating the locusts with "yeast poison" reminds me of the old lady's attempt to keep back the ocean with a mop. If the Missouri ran only yeast it would not suffice for that purpose. The propagation of fungi in insects depends very largely on climatic conditions."

LOSS OF LARGE FULL-GROWN ANIMALS.—It is astonishing that people will continue to ship those across the ocean, after the repeated losses for years past in transportation. Out of eleven highly valuable Clydesdale horses recently shipped at Scotland for the United States, four were lost on the voyage. This is only one specimen of dozens of similar losses that have taken place this year, and more particularly among the fat cattle shipped for England. As these are not so well stalled on board ships as horses, the percentage of loss is greater among them; so great sometimes as to be more than the profits realized on the animals surviving, after being sold in the English market. Is there no humanity left in the hearts of shippers for the poor, dumb animals?

NOW that our foreign grain trade has become so enormous and promises to maintain its present proportions, it becomes a very serious problem how the ocean carriage of grain can be made safer than it is. More grain-laden ships are lost than any other kind, and this seems to be unavoidable while grain is carried in bulk. The shifting of a cargo during a storm throws a vessel on her beam ends; a leak causes the grain to swell, which bursts the ship, and no art of the shipowner can stow a cargo of grain so as to hold down the enormous weight when the ship rolls and pitches in a heavy sea. For the four years past, the recorded losses of grain ships has been 32, with 250 lives, and 1,500,000 bushels of grain. Here is an opening for inventive genius to provide a secure method of loading such ships.

RED BERKSHIRE SWINE.—The National Live Stock Journal says that a Mr. Miller of Iowa, has a large herd of these, and realized in July for a lot of 60 head, sold in Chicago, ten cents per 100 pounds higher price than was obtained for any other fat swine on the same day. The lot averaged, at one year old, 365 pounds each. We should like to know what authority Mr. Miller has for calling his swine "Red Berkshires;" for none purely red were ever bred in that district of England to our knowledge; but the original Berkshires were a red ground, well spotted with black. Are not these Miller swine simply "Jersey Reds;" such as have abounded a long time in the State of New Jersey, and are now spreading elsewhere? These are marked like the original Berkshires, are of larger size, coarse in the bone, with great flop ears. They are a thrifty, hardy race, and attain heavy weights at an early age, but do not fully mature till two to two and a half years old.

"THE system of ensilage has but one enemy to fear, and that one is the scientific agricultural writer, who knows nothing by practice concerning it, but who sees a great revolution in agricultural methods impending, and who wants to hang on to the car of progress, so that when the result is achieved he may claim credit for advocating a new system, which his crude, impractical and theoretical advice only seemed to delay and endanger." Thus writes Mr. John M. Bailey, in the columns of a respected contemporary, in opposition to a correspondent who ventures to oppose some of his statements. The "system of ensilage has one" other "enemy to fear," we opine. It is the statements of a man, who, riding upon the ensilage hobby, introduces to the public Blount's White Prolific Corn as a new variety of his own, charging three times the amount per bushel for which it can be purchased in the market, and appropriating the RURAL NEW-YORKER'S engraving as his own picture of this new variety, to which without any right whatsoever he gives the name of Mammoth Ensilage Seed Corn! This reckless appropriation of the variety of corn to produce which cost Prof. Blount no little labor and care, to say nothing of the equally flagrant use of our engraving as his own, is apt to beget in the public mind grave doubts of anything the offender may say with regard to ensilage. *Falsus in uno falsus in omnibus* is a pretty correct old adage.

WE publish the following, with much pleasure: "I am sorry to learn that by inclosing in a letter to you a brief statement or two in regard to corn sugar, you have so far mistaken my purpose and motive as to suppose that I intended to give your readers simply a rehash of matter which had appeared first or simultaneously in other papers. You do me a great wrong. It is true, indeed, that the very brief statement which you published did appear in three or four newspapers about the same time—and that it came from me; but it was intended to correct a tissue of misrepresentations and mistakes which were being industriously circulated to the disparagement of the Department of Agriculture. I deemed it a fitting introduction to the series of original articles, which in good faith I proposed to furnish you for publication solely in your paper, and which in like spirit, I doubt not, you wrote me your desire to accept. The statement bore upon its face the evidence of being a copy, but perhaps I did not say so—and thus blunderingly exposed myself to your criticism. Your remark in the column of "Brevities" is just and wholesome in its application to a certain scalawag method of advertising occasionally prevalent, and to those who practice it, but do me the credit of believing that those remarks do not apply to me either in the "present" or any other "instance."

F. L. STEWART.

Literary Miscellany.

BOOKS.

THEY came into my dwelling, one by one,
Each a most welcome, and an honored guest,
I never was so sad they could not cheer,
So weary they did not bring me rest.

They bear grand names, these quiet friends of mine,
And yet they scorn no lowly household nest;
They care but for appreciation, love,
To him who gives them these they give their best.

The evening comes, my daily task is done,
From household cares my hands at last are free;
The children in their bed, the father gone
To battle with the world for them and me.

Then turn I to my guests, and lo! they wait
For me with smiling faces, words of cheer
To make the burdens of the day seem light;
The dear ones I have served seem yet more dear.

They sing grand songs, they paint me pictures fair;
Tell of heroic deeds, by land and sea;
Of lofty castles whose now crumbling walls
Were once the pride of ancient chivalry.

Perhaps Sir Walter's magic mirror shows
Some gallant knight contending for a prize,
With all the fire and force of one who knows
His efforts watched by bright, approving eyes.

Perhaps a sadder scene—that plumed head
Upon some fatal field is lying now;
No mimic warefare this, in which he dies,
No "queen of beauty" crowns him victor now.

I leave the "Wizzard of the North" awhile,
Here is another guest that I like well:
Let others criticise, I love the hand
That wrote so tenderly of "Little Nell."

Her beauty, and her worth, we knew by heart;
And of her weary pilgrimage below,
While the same hand that made her seem so sweet
Drew us to pity poor "know nothink" Joe.

There is another, yes, I like him too
With his half-kindly, half sarcastic air,
He introduced me to "Pendennis" once,
And took me for a stroll through "Vanity Fair."

Recalling to my mind another "Fair,"
Bunyan describes its vain, delusive gleam,
That brave old pilgrim who, long years ago,
Reached the "Celestial City" of his dream.

The hand that gave us "In Memoriam,"
And he who wrote of sweet "Evangeline,"
Seem clasped fraternally, although I know
They dwell in different lands, the sea between.

Others I see, the witty and the wise,
Who, even in childhood days, were my delight.
They have not lost their charm; but it grows late,
And I must bid my pleasant friends "good night."

WINNIE'S FORTUNE.

"MAMMA, Mr. Harcort has really come."

"Has he? How do you know?"

"I met him just now in the High Street; he is so brown, and—oh, dear! I've forgotten to get that wool for Maud; I must run back at once, or it will be too dark;" and away scampered madcap fourteen-year-old Hettie.

No sooner was the door closed behind her than Mrs. Maitland fell into a fit of musing, and the work on which her busy fingers had been employed lay unheeded in her lap.

She was the mother of a large family with three marriageable daughters. Like all mothers she was anxious to see her girls comfortably settled, and here was the chance of a most suitable match for one of them.

David Harcort was a young man of irreproachable prospects. At five years of age he had succeeded to the family estates. They were heavily encumbered, it is true; but by judicious management during the long minority of the young heir, every claim had been paid off, and a goodly sum in ready money had accumulated as well.

His visits to Westford had hitherto been but short-flying ones, lately, however, a rumor had gained ground that he was coming to take up his abode permanently at The Grange, and as the house had been undergoing considerable alterations, the report appeared to be not without foundation.

Consequently, Mrs. Maitland pondered and planned. David Harcort would certainly make a most desirable son-in-law, therefore Mrs. Maitland considered herself justified in trying all means in her power to gain him for such a relative. And if he did not succumb to the belle-like charms, the *petite* figure, the pink-and-white complexion, the rosy, pouting lips of fair-haired Lina, surely—surely he must lay down his arms before the dark eyes and queenly grace of stately Maud.

Major Maitland should call upon him soon, too. Yes, that must be the first step, and then? why she had better fulfil a long-standing promise and give a party. Both the girls were young enough and fresh enough to look well by daylight, but still it was the best way of getting on friendly terms; and besides there were several society debts to pay off.

Here the good lady's planning came to a full stop.

"I will consult Winnie," she remarked to herself; and even as she was saying it the door opened and Winnie entered.

Winnie was plain; there was no denying it. She was not attractive beyond a pair of earnest gray eyes, and an abundance of soft brown hair. Not being ornamental, it had been taken for granted that she must be useful, and therefore from her earliest years upwards she had been accustomed to exercise her fingers and thoughts for the benefit of those about her.

Very speedily Mrs. Maitland unfolded her projects, that is to say, she informed Winnie of her party-giving intentions, and casually mentioned that when papa called on Mr. Harcort, if he approved of him, he might be invited to the proposed festivity.

Whether Winnie's shrewd common-sense enlightened her as to her mother's harmless little scheme it is impossible to say, but she entered with pleasant alacrity into all the arrangements for the unusual gaiety.

After comparison of dates and possible engagements, it was settled that the 10th of January would be the most convenient night for which to issue invitations.

"And now as to your dresses," said Mrs. Maitland. "It is a long time since you have had new ones, so we really must manage the expense."

"Let me see," mused Winnie, "pale blue suits Lina better than any other color. Suppose, mamma, she had a pale blue crepe; and Maud always looks well in amber and black. She might have black net, with amber trimmings."

"Yes, that would do nicely; we will see what they think. But you want a fresh one, too."

"No, indeed I don't. I shall iron out my grenadine—it is only crumpled, not torn—and do it up with bows of coral-pink ribbon."

Mrs. Maitland gave utterance to a few feeble protests, but her objections were soon overruled.

Somehow, Winnie not sharing her sisters' dower of beauty, her attire had never seemed of such grave importance as theirs.

Major Maitland, instructed by his wife, paid a visit to The Grange, and brought back a glowing account of its young master. An invitation was accordingly dispatched, and promptly accepted.

The day of the ball came. Lina's blonde tresses had been in paper till the eventful dressing hour, and Maud had been closeted with the dressmaker all the morning. Winnie flitted hither and thither, ornamenting the rooms with flowers, constructing cunning little arrangements in the way of muslin drapery, setting out the supper-table, and keeping a general supervision over servants, children and confectioners' men.

"Winnie, child, come and put my cap straight," called out Mrs. Maitland over the banisters, as Winnie, grimy and disheveled, hastened up-stairs to put herself into company order.

"For goodness sake, Winnie, come and tell me if my hair does," frantically exclaimed Lina, appearing at her bedroom door.

"And then I want you to fasten my tie-backs, Winnie, there's a pet," cried Maud from within, for she and Lina shared the same apartment.

Having performed these and various other little duties required of her, Winnie hastened off to array herself in her own finery.

The rooms were already well filled when *the* guest *par excellence* of the evening arrived.

He was greeted with a beaming smile by his hostess, and after the interchange of a few polite remarks, she led him to where Maud was holding mimic court.

"Mr. Harcort—my eldest daughter, Maud—Mr. Harcort."

David bowed low, and hoped that Miss Maitland's engagements would allow him the honor of a dance with her.

The next was a quadrille, and this Maud graciously accorded him.

They were at the last figure when he suddenly addressed his companion:

"I am most lamentably ignorant of the names even of my neighbors in Westford. Will you tell me who that young lady is, seated on the opposite side of the room?"

"Which one do you mean? There are several sitting there."

"The one in pink and white, talking to an old lady in black satin."

"Oh! that is my sister; my second sister, Winnie."

"Indeed. May I ask for an introduction presently."

"Certainly."

"Winnie, Mr. Harcort wishes to be introduced to you."

Winnie was listening with praiseworthy patience to old Mrs. Armstrong's rambling account of her last attack of rheumatics. She flushed a little as she turned and encountered the intent scrutiny of a handsome pair of hazel eyes.

One of Strauss's divine waltzes sounded an irresistible invitation to all lovers of the Terpsichorean art, and Maud's partner came to claim her.

"Are you engaged? Can I have the pleasure?" said David to Winnie.

"No—yes," she answered, laughing, and took his arm.

At that moment a servant approached and whispered to her that she was wanted in the kitchen department immediately.

"Will you excuse me, please?" she asked, withdrawing her hand.

"Really it is too cruel to desert me so soon," he returned, in an aggrieved tone.

"I am sorry; if—if you mind——"

"*If* I mind!" he rejoined, tragically. "You add insult to injury, Miss Winnifred."

Poor Winnie's cheeks burned most uncomfortably, as she flew down-stairs to rectify some domestic misadventure.

When Mrs. Maitlands aching head was laid on her pillow it was with the satisfactory reflection that Mr. Harcort had been most attentive to Maud and Lina, though which had particularly struck him it was hard to say, as he had appeared equally agreeable to both. David sent his carriage back unoccupied, preferring his legs to any other mode of locomotion.

"No, she's not exactly pretty," he soliloquised thoughtfully, puffing at his cigar, as he walked along the frost-bound road; "but she's ten times better than pretty. The other two are thoroughgoing beauties, but there is something wonderfully captivating about her. How bewitching she looked, too, when she blushed. Well, I'll wait a month, I won't do anything rash before, and then—and then——"

Two days later Mrs. Maitland and her two eldest daughters were at work in the drawing-room, when Mr. Harcort was announced. Mrs. Maitland gave him a most cordial welcome, and the young ladies' smiles were sweet and ready. Yet David did not seem quite satisfied. He watched the door anxiously, and listened eagerly to every footfall that crossed the hall outside.

"Miss Winnifred is well, I hope?" he said, presently.

"Oh! yes; she is out in the town now."

Shortly afterwards he took his leave, resisting the many pressing inducements to stay and partake of afternoon tea.

He advanced as a plea for his refusal a business appointment with his steward. But the importance of this interview apparently diminished when he got out into the street, for he sauntered slowly along, carefully scanning every passer-by of the gentle sex.

At sight of an approaching figure in a fur-trimmed paletot and brown felt hat, his pace quickened.

"I am fortunate," he said, lifting his hat. "I have just left your house."

"Have you," observed Winnie, her color unaccountably deepening.

"I hope you were not very tired after your exertions the other night," he said, turning to keep at her side.

"Me tired? Oh! no," she answered, in surprise, as though fatigue were a sensation unknown to her.

The red-brick house, with the old-fashioned bow-window, was reached all too quickly, and with a close clasp of the hand David wished her good-bye.

"Save me!" he muttered, stalking briskly away, "I'm afraid I shan't last out the month. I was sorely tempted to say something then. I suppose it's a judgment on me for making fun of love at first sight. Well, if knowing the feeling is my punishment, I've had my deserts at any rate."

"Please Miss Winnie, you're wanted in the drawing-room."

It was the tenth of February, a chill, drizzling day, and Winnie was giving one of the children a music lesson on the battered old piano in the school-room.

As she entered the drawing-room a gentleman moved from the window and advanced towards her.

"Ah! Mr. Harcort, how do you do? You—I—Jane told me I was wanted," faltered Winnie; in some confusion.

"And Jane spoke truly, you are wanted."

"Am I? Who wants me?"

David did not answer at once. It is a trying moment when a man is about to put the happiness of his life to the test—to lose all or gain all.

Winnie watched him slightly surprised. His manner was rather peculiar she thought, for no faint glimmer of the truth had yet dawned on her.

"Have you not the least idea who wants you?"

Her astonishment increased. She retreated towards the door.

"Yes, mamma I expect; I—I will go and see."

He caught her hands quickly to detain her.

"Winnie my darling, it is I who want you. Oh! don't send me away with my life hopeless my love unsatisfied."

She lifted her eyes to his. She saw the love-light shining in them, and her own dropped lower and lower, while a great wave of crimson surged up into cheeks and brow and neck. There was just one ineffectual struggle for freedom, then her glowing face was hidden on a strong man's shoulder, and a low voice was whispering sweet secrets in her ear.

* * * * * * *

"Mamma, I have some news for you."

Mrs. Maitland's interest was immediately aroused.

"Well, dear, what is it?"

"Young Harcort is here; he has been speaking to me."

"Yes?"

"About what do you suppose?"

"About one of the girls, of course, though really I don't know which. He has not been long making up his mind certainly; we have only known him a month."

"Which one do you imagine it is?"

"I have fancied that he inclined to Maud, and she is the eldest, so it is only right she should be married first."

"No, it is not Maud."

"Not! Well, Lina will make a charming little matron. Dear child, I must go to her at once."

"Stay a moment, Ellen. You are not right yet; it is neither Maud nor Lina."

"Neither Maud nor Lina? What—what—Why, Robert, you don't, you can't mean that—that it is Winnie?"

"Yes, it is Winnie."

Mrs. Maitland sat speechless with amazement. Her two handsome daughters passed over, and plain, unattractive Winnie chosen. It was incredible, almost beyond the bounds of belief.

"I always knew," said the major, after a few minutes' pause, "that Winnie was a dear, affectionate girl, and that if she hadn't good features, she had a good sound heart, and I always expected some day some one would find it out, and want to take her from us, but like you, my dear, I never thought *that* would be till the other two were married. I am afraid we have been underrating her."

Mrs. Maitland made no reply; she could not rally her senses quite yet.

"I deferred giving him a positive consent till I had spoken to you, though I told him I thought you would approve. You do, do you not?

"Yes; oh! yes," answered his wife, with the calmness of a great surprise still upon her.

"Then I will go and relieve the poor fellow's suspense; he is waiting in the study."

Mrs. Maitland sat trying to recover her scattered senses, when the door was noiselessly opened and a slender, gray-clad figure stole softly in. A penitent, beseeching face was laid on her shoulder.

"Mother, are you very much disappointed?"

"My dear child, I am very glad that David Harcot has chosen you. He will make a good husband—true, upright and faithful; and no man could desire, no man could have, a better wife than my little Winnie, though I do not know what we shall do without you, or how we shall be able to spare you. Kiss me, darling, and then we will go down and ask him to stay to dinner."

AGENTS.

VELENA.

"Of Them There is no Lack."

IT had been my hope that with the coming of "dog days" there would be a stopping off of agents who go hawking through the country with wares of little or no value, for sale.

Wares your better judgment tells you you do not want but which are set forth in such glowing terms that you wonder how you have done without them. Even in the face of previous bitter experience one is often induced to buy and frequently after having seen a mere sample.

A short time since two men purporting to come from Chicago were offering fancy toilet soap at half price. Being victimized to the extent of one box, that now is shriveled to a hard, dry, salty, distorted mass, when an agent comes along wanting to sell a superior article at a low figure, I have only to think of my "box of soap" and occasionally exhibit it. Some are inclined to argue the case but the sight of that soap has had such an effect upon me that arguing is of no use. However I am inclined to think that that one purchase was a saving investment. This much it has at least proved to me, that men do not hire fine establishments and dress in fine clothes and ride about the country to sell better goods at lower prices than can be had of residing merchants, druggists or grocerymen. Reason teaches that the articles must be paid for or stolen, the establishment costs and the fine clothes do not grow spontaneously, and the men are not going to squander their time or waste their talent for nothing. What they want is your money; they are not interested in you; it is their own dear self in whom all their interest centers; and that interest consists in getting all the loose change into their own pockets. They have not the slightest idea of giving you value received for your money.

Recently an elegantly dressed lady representing a charitable institution had for sale some jewelry claiming to sell it at a great sacrifice for the benefit of this Institute; and so sweetly, so smoothly could she address one that many sensible people were ogled into buying. The gold turned out brass and the people, too late, found they had been swindled. Had they taken the facts into consideration they would have known there was something wrong. Goods cannot be sold below cost without a loss unless they are of a class that can be easily adulterated.

The fact is if we do not care to be imposed upon we must not allow ourselves to be flattered into buying, especially what we do not want, merely because it is cheap.

We must be "wise as serpents and harmless as doves," with agents, peddlers or whatever name they may be called.

When younger than now it used to make me uneasy to listen to these apparently wholesome truths told by the genteel traveler and know I had not means to help relieve suffering humanity; and I fear too many have similar feelings. For how often the honest hardworking woman feels herself grow contemptibly small before an oily-tongued vender of useless wares because she cannot for "sweet charities sake" (as he represents it,) buy a half dollars worth. Did we but know the truth of his story with what different feelings would he go away from our door.

And anon this traveler has labor-saving machines, or perchance is soliciting subscriptions for a valuable work now in the publishers hands. His whole story is summed up in your behalf; for your good; solely for your interest according to his way of putting it. Now why is it that he, a stranger, takes such deep interest in you. He whom you never saw before and probably will never see again. Simply because he wants the money in your pocket put into his own.

It is easy to tell another what they ought to have done; one can even think for himself afterward; but it is quite another thing to know at the moment what to do or what to say when sentences full, round and glowing are overwhelming you. We are simply overpowered and upon the impulse of the moment allow goods to be sold to us, or subscribe if orders are being solicited and afterward bitterly rue the day and the hour that found us so weak.

Strong men as well as weak women are also victimised, and is there no way in which we can combine to abolish, to annihilate this daily growing nuisance, if not really evil?

NANKEEN.

OF all the cotton produced in China, the most remarkable, as well as the most beautiful, is that used in the fabrication of the calico known in Europe under the name of nankin or nankeen. It has been long a matter of debate whether the texture called nankeen was manufactured from a raw material, having, previous to any manipulation, the yellowish hue which distinguishes it, or whether it owed its peculiar shade to a light dye.

M. Van Braam, who was at the head of the commercial mission sent out by Holland to Pekin in 1794, had been instructed by the European merchants to request that the nankeen destined for their different markets might for the future be dyed a deeper color than they had been for some time past; and he had an opportunity during his stay of ascertaining that the color of these textures was natural to the raw material, and not subject to fade.

Sir George Staunton, one of Lord Macartney's embassy, found, on going through the province of Kiangnan, that the cotton it produces is naturally of the yellow color, which it retains after spinning and weaving. He also says that when the nankin cotton is transplanted to another province it degenerates and becomes white.

We saw, in the environs of Shanghai, cotton trees with yellow down growing in close neighborhood with white cotton-trees, the latter, however, being much the most numerous. There were some, also, producing a down of an intermediate shade, but it appears that the yellow cotton prevails most on the banks of the Yang-tse-klang, in the environs of Nankin, and on the borders of the great canal. Its color is attributed by many to the oxide of iron contained in the soil where it grows, and this would explain its being subject, when transplanted, to degenerate and produce white cotton.

Ilocos, one of the provinces of the Philippine Isles, has likewise a reddish cotton named coyote, a still deeper color than that of Klang-nan; and the plant, like that of China, deteriorates when expatriated, and produces a white down but, on being restored to its native soil, is again covered with red cotton.

From every opportunity of comparing, on the spot, the color of the calico of Nankin and of Ilocos with that of the raw material, we were compelled to draw the same conclusion that it was natural, and to admit, as a certain and indubitable fact, the pre-existence of this shade in the thread employed by the weaver.

The cottons of Hayti, of Caraccas, of many parts of India, and especially of Purneah and Orissa, as also the cottons of Egypt, present a hue which closely resembles that of the Nankin cottons, and which would probably remain in the unbleached manufactured article.

BOREL AND COURVOISIER WATCHES.

Among the finest watches of Swiss manufacture are the "Borel and Courvoisier," which have been made by the firm whose name they bear since the year 1850, and during all the space of time which has elapsed since that date, have been proved to be most excellent and perfect-working time-pieces The first medal awarded to a foreign watch manufacturer was given to these watches at the Great World's Fair, held in the city of London in 1862. They also received the highest awards at the Centennial Exposition in 1876, and that of Paris in 1878. The decision of the judges at the Centennial Exposition signed by their chairman, Judge J. C. Watson, was as follows:

"The undersigned having examined the product herein described, respectfully recommends the same to the United States Centennial Commission for Award, for the following reasons, viz.: The excellence of workmanship in the manufacture of watches and pocket chronometers, of which five were accompanied by the transcript of the records of their trial at the Observatory at Neuchatel, officially verified, showing that their adjustments are good." Signed: J. C. Watson.

The award given them by the Paris Exposition was the highest given—the gold medal. The superiority of the Swiss watch-makers in the work they turn out has been acknowledged by nearly all of the Sovereigns of Europe. They have made watches for the crowned heads of France, Germany, Austria, Prussia, England, Italy, etc., and in fact supplied the world with the works of their genius, and in their turn these same monarchs have at times, by the conferring of honors and princely gifts, shown their appreciation of the talent, enterprise and industry of the hardy, free-born Swiss artisan. At the Paris Exposition, one of Switzerland's sons, Louis Andeman, was decorated with the Grand Cross of the Legion of Honor. These things show how unjust is the attack made upon the product of these same workmen, who on the contrary should receive the praise and justice due their manufacturers.

All Americans, however, are not so prejudiced, and the majority do not indorse such a senseless attack upon goods which, of their kind, are without a superior. Writing from Athol, Mass., under date of February 20th, 1880, Mr. D. J. Wandell, for example, in a letter to Messrs. Quinche & Krugler, No. 17 Maiden Lane, this city, agents for Borel & Courvoisier watches, in speaking of these latter, says: "A people (the Swiss) so exquisite in nature and capacity, and the very pioneers of the finest styles of mechanism, do not deserve to be run out of the market quite yet, and indeed cannot well be dispossessed of their ancient and well-earned fame for reliable and finely finished time-pieces. Even the gold and silver of their cases are better than those of the American manufacture. The machine method of Americans does well, and they can produce good time-keepers, but I have a Waltham ($75) watch, and a Swiss ($50) watch, the latter is far preferable to the former. The Waltham regulator put to its utmost of slow has gained right along 2 minutes per day. The foreign watch is true to the slightest variation and runs steadily on time."

Mr. Pearce Rogers, of Wine Hill, Morris County, N. J., writes: "I tender you my hearty gratitude for the excellent time-keeper with which you supplied me. After a trial in severe heat and cold, I am satisfied that the watches of Borel and Courvoisier are all that you claim for them, and in my own chronometer the variations from the regularity of the heavenly bodies has been so slight as to be not worth mentioning."

These two are but samples of hundreds of letters of similar import from all parts of the country addressed to Messrs. Quinche & Krugler, indorsing the Borel & Courvoisier watches. For years we have used these watches largely in our premium lists, and do not remember to have ever received a complaint of their "working" from any one of the hundreds who have obtained them through us, while we have received very many praises of their excellence stronger than even either of the above.

To be happy, the passions must be cheerful and gay, not gloomy and melancholy. Hope and joy, are real riches. Fear and sorrow real poverty.

BRIC-A-BRAC.

HAVE YOU?

Have you ever helped the drunkard
To become a sober man?
If you have not, from this moment
Do for him what e'er you can,
He's your brother—though so fallen—
And his "keeper" you should be;
Talking, coaxing, helping, loving,
Is the work for you and me.

EXAGGERATIONS.

A family while at the breakfast-table one morning pledged to observe the strictest veracity for that day. A member of the family tells the "consequences."

As a first-fruit of the resolve, we asked the one who suggested it:

"What made you so late at breakfast this morning?"

She hesitated, began with, "Because I couldn't"—and then, true to her compact, said, "The truth is, I was lazy and didn't hurry, or I might have been down long ago.

Presently another one remarked that she had been very cold, adding, I never was so cold in all my life."

An inquiring look caused the last speaker to modify this statement instantly with, "Oh, I don't mean that! Of course I've been much colder many times, and I don't think it was so cold, after all."

A third remark to the effect that "Miss So-and-so was the homeliest girl in the city," was recalled as soon as made, the speaker being compelled to own that Miss So-and-so was only rather plain instead of excessively homely.

So it went on throughout the day, causing much merriment, which was good naturedly accepted by the subjects, and giving rise to constant corrections in the interest of truth.

One thing became more and more surprising, however, to each one of us, and that was the amount of cutting down which our most careless statements demanded under the new rule.

LIFE.

"We live but one life here," he said;
"The soul needs love, the body bread."
So to the needy and the poor
He gave, nor turned one from the door
That asked admittance to his heart.
Each, with a blessing, did depart.
This man will find, when death arrives,
He's lived a part of many lives.

WANTED TO SEE THE EDITOR.

A man on the cars was offered a newspaper. He took it, looked at the heading, and then threw it aside with disgust, and remarked:

"I don't want news from that paper."

"I supposed everybody read it in these parts," I answered. "Has it been pitching into you?"

"Pitching into me? Great Cæsar! I should think it had. But you just let me meet the editor of that paper."

"You never make anything by striking an editor," I said; "better grin and bear it."

"Yes, that's all right for you to say; but just let me meet that man! I'll show him how to run a newspaper."

"What did he do?"

"Do! He did a deal. Here's how it is: I often go up to Springfield in the evening and come home on the first train in the morning. Well, one night I met an old crony, and we went to the music hall and the theatre. When we came out we met some friends. Of course I could not get right out, so I treated; in fact, we were having a pretty good time, when some fellows came in and tried to raise a row. In less than no time the police were in and had us. The next morning I was hauled before the court and fined $7.40. I did not care much, because I gave a false name, and I knew my wife couldn't find it out; but the very next morning I'll be eternally confused if that paper didn't have it all in, and my name, too."

"Did your wife see it?"

"I should say she did."

"Did she make a fuss?"

"Fuss! Godfrey Elihu! Are you married?"—Rural World.

Sum up at night what thou hast done by day,
And in the morning what thou hast to do.
Dress and undress thy soul; mark the decay
And growth of it. If, with thy watch, that too
Be down, then wind up both. Since thou shalt be
Most surely judged, make thine accounts agree.
—George Herbert.

A very grand head is Gambetta's. The lines are ample, and express power at its ease. About the temples and over the eyes the development of the forehead is abnormal. Gambetta's superiority is not of a kind to awake jealousy. It is very manifest, but it is so unalloyed with egotism, and it is so softened by good-fellowship that a man of talent, who feels small in the presence of the great tribune, does not, for that, feel humiliated. Gambetta enjoys companionship more than "society," as "society" is understood in our time. He likes clever women if they are unaffected, and he does not believe a woman's conversation can charm a man of intellect unless it is the outcome of much study, observation, and long-sustained mental efforts. The professional beauty would be nothing to him unless her loveliness were lighted up by wit.

"If we know when friends around us
Closely press to say "Good bye,"
Which among the lips that kiss us,
First beneath the flowers should lie,
While like rain upon their faces
Fell our bitter, blinding tears,
Tender words of love eternal
We would whisper in their ears."

Life's evening will take its character from the day which has preceded it; and if we would close our career in religious hope, we must prepare for it by continuous religious habit.

For Women.

CONDUCTED BY MISS RAY CLARK.

OVER THE LEFT.

EDGERTON.

"Well, Jane, it really does appear
That everything goes wrong?
I've pulled and tugged at that old brute,
For I can't tell how long,
And now I've got to grind the knives,
Whatever else betide,
And toddle over to the branch
And lift the old beast's hide."

"It's just too bad! and I can't see
Why we should have such luck—
The only decent cow we had
Fast in a mud-hole stuck!
It's true the crossing needed work,
Was sorely out of fix,
I'll go to-morrow, if I live,
And patch it up with sticks.

"If this were all, I might not growl,
But bad luck ever comes
Not singly, but in pairs, you know,
As do the "wild-goose" plums.
And neighbor Jones who just passed by,
Leaves word with Agnes Thorne,
That wayside stock are ravaging
That bottom field of corn.

"I told our boys a month ago
Just how this thing would be:
But that is all the good it did,
They pay no heed to me!
To-morrow, if I live, I'll go
And mend that broken fence,
But this, for all our wasted corn
Will poorly recompense.

"But worse than all our other luck,
And hardest yet to bear,
Is that misfortune of last night,
The loss of our best mare—
Our trustful friend throughout the year
In every time of need,
The ever-faithful one to work
And willing for her feed.

"I'd like to see the sneaking thief
Who rode that beast away,
Hung high and dry to some stout limb
Hard by the public way!
Let him a warning be to tramps
Who prowl our country o'er
On evil purposes intent,
And beg from door to door.

I'll go to-morrow, if I live,
Down to the hardware store
And buy a good stout bar and chain
And lock the stable door—
It might have been as well, perhaps,
Had this been done before,
Since now the horse is stole, and gone
What need to lock the door?

"It does seem, Jane, that we are blessed
With every kind of luck!
Our crops destroyed, our horses stole,
Our cattle in the muck!
And I don't seem to understand
Why such should be the case;
I've lived an honest upright life
And no man fear to face."

"Come, David, now I'd not repine,
What is to be, will be,
The fates work out their own true ends,
Despite of you and me;
We'll change this luck, I'll warrant you,
Before we're ten day's older,
By looking at the next new moon
Over the other shoulder."

A WOMAN'S WANTS.

Mrs. A.—ran in just now to ask if I could give her a few hints with regard to fall dresses. May and Lulu are going to a select school this fall, and their wardrobe needs replenishing.

Said she, "let us look over your papers and magazines. Mr. A. thinks he can only afford the local weekly paper, and I go out in public so little, that I do not know what is or is not fashionable. When I try to dress the girls, I have no idea what to buy or how to make it up, and the consequence is I pay twice as much as I need to for material, get it made in some odd fashion that we never like, and so at an extra cost, we manage to look as outlandish as possible."

"I know just how it is," I said, "and we who take one of the fashion magazines, and several other papers with the local paper, are but a little better off." But, gathering up a package of papers I sat down.

"Here are the fashion cuts, let us look at these first," I suggested "Party dress, pink satin with overdress of lace" "pshaw! Let's look farther, "dinner dress—black satin and brocade front of shirred satin—&c., &c."

We tossed the magazines one side and taking up the Rural I turned to that sure of some practicable suggestions. "Brocaded foulard," "Surah in all colors," "Heliotrope-colored cashmere," woolen crape, ashes of roses," well! we laid down the Rural, also, for what *foulard*, or *surah*, or *crape* were we did not know, could not buy them at our country stores anyway.

So I put aside all the papers, set my wits to work, and with our own ideas we planned an outfit as circumstances required and means allowed, but it led me to wonder if papers could not give each week a few hints serviceable to us farmers' wives; as to kinds of material, colors—giving an explanation of the color not simply the name which is usually in French, and conveys no meaning to us; the kind of lace or other trimmings used, cost etc., etc.

Also hints as to making up lawns, ginghams, etc., all and any idea which a farmer's family could find practicable.

The lists of short fashion notes are the most practicable, usually, if they describe the more inexpensive materials, which come within moderate means.

I think people of wealth and fashion seldom refer to papers or magazines for fashions, but depend more upon their dressmakers, who follow latest *Paris* fashions. Farmer's Wife.

[We are glad to know of the wants of our friends, and shall endeavor to profit by the above suggestions and supply the needs of those in moderate circumstances, and have not the opportunity of visiting neighboring cities. By way of explanation of former fashion reports; the presumption was that ladies would wish to be informed of the latest and fashionable goods and styles, and also their proper names. Descriptions of the simpler materials have at times been given.

"Brocaded foulard" is a figured silk, soft and thin.

"Surah" is a soft twilled silk.

"Heliotrope-colored cashmere" is a woolen material, the color of the beautiful flower that adorns most of the rural gardens.

"Crape" is a thinnish material having a curled appearance.

"Ashes of roses" is a peculiar shade, having the appearance of a combination of pink and brown] R. C.

REST AWHILE.

I never knew many lazy women in any walk of life. Sometimes a young girl will be lazy, but she usually gets over it with added years. Most women go to the limit of their ability, and then see enough beyond which they seriously believe they ought to do, which would take another woman's full time. A morbid conscience will set these sins of omission in such order before a woman's mind sometimes that life is robbed of all its sunshine. Or a censorious neighbor will so goad on the lagging energies that the whole machine at last must come to a final crash.

Many a young wife and mother owes her death to the sharp tongue of some iron-clad woman among her kindred.

Any jury who understood the case would bring in a verdict of "murder in the first degree." All who have helped to "hunt down," so to speak, a feeble woman of their acquaintance, calling her "lazy and inefficient," and pitying her family because of it, can have the happy consciousness that they have done their share in placing her in her coffin, or sending her to an insane retreat. "Man's inhumanity to man" cannot begin to equal "woman's inhumanity to woman" very often, especially in communities where "work" is the enthroned deity.

When the industrious woman feels these "lazy fits," as she calls them, coming on, when the pulse beats low and the step loses its elasticity, when she doesn't even "care much" what Mrs. Blank says about her housekeeping—she may know it is nature's warning signal bell, telling of "breakers ahead." Her choice must be between a little rest now, or total wreck by-and-by.

"Come apart and rest a while," were the loving words of One who "knoweth our frame" to His tired followers. He says the same now to many a toiling Martha.

Perhaps a *day* cannot be spared, but why should you so grudge an hour for an afternoon nap which you may so greatly need, or a half-hour for a book or paper you would so much enjoy.

There are women to whom it would come almost like a new revelation to know that it was "right" to stop in the midst of the busy day and listen with rapture to the oriole's song in the plum tree, or drink in the beauty and fragrance of a bed of pansies, or watch musingly the dripping rain drops among the foliage of the maple by the window. They put back the sweet thoughts that come like strains of music to the soul, and turn again to their cumbering cares, with the unspoken thought that "time is too precious to be thus wasted."

Yet, who bids us "consider the lilies?" Are not there sweet whispers to our soul to win us to a better portion, that will not perish like the labor of our hands?

Let us learn to redeem the time from much that is really useless, and give it to wholesome rest and pleasing recreation, if we would have our days long in the land and spent in health and happiness.

Lois.

CHARACTER.

Character is the estimation or worth in which one is held; or simply the sum of our actions, words and deeds. Therefore, forming our character should be the first and most essential art that we study. Although *perfection* has never been attained, it may like other arts be so thoroughly studied that the eye of man cannot rightly detect but few imperfections.

In the choice of our friends we, in some measure, form our character, for we are likely to be influenced by the character of those whom we choose for our friends. The person who possesses a true and noble character has won many victories; has many pleasures and advantages that one of a bad and unfriendly character never realizes or enjoys.

By strangers our character can be read in our countenances, especially by those who study that art, because there is not a thought, word or deed that does not leave its autograph on the human countenance.

It has been truly said that "what we do not do is more often a better index of character than what we do." Who of us will acknowledge that we could not possibly have formed a better character. Maud.

POWER OF ASSOCIATION.

How strong is the power of association! especially that of our earlier years.

I have often noticed many families in the West who continue to subscribe for the local paper published at the place where they resided in their young days. Nearly every county in the western part of the State of New York is thus represented.

A lady said to me the other day, as I remarked her having the newspaper from her native town, in a distant Eastern State, "Yes, I have been here

over twenty-five years and nearly all I knew there are dead or have removed to other places, but I love the old familiar names even, and should miss the paper as I should the face of a friend, if I did not have its weekly visits! It seems to bring back to my memory the solemn, old and beautiful maple woods, and the early Spring beauties; the adder-tongues and other flowers that grew in their shade.

I fancy myself a child again hunting for ground nuts, gold thread or beech nuts, or assisting in keeping up fires to help my father and brothers make maple sugar. It seems like a dream of heaven when such recollections crowd on my mind, and they do, when in an hour of leisure I sit down to scan the columns of the same old paper that was so familiar to my eyes in my father's house.

I hope that when my children leave their home they will be able to take with them such pleasant recollections, for it is pleasant and profitable to have the storehouse of memory filled with such images, they go with us to the end of life and help to keep us from becoming too wordly and selfish."

As I looked at the sweet and placid face of my friend I thought that such had been the power of association with her. E. C. D.

WHAT I KNOW ABOUT HUSBANDS.

M. J. T. rather espouses the cause of the husband. She is a true woman, I'm sure, a cheerful, earnest, intelligent christian woman, and she has been observant in this work-a-day world and seen how, in our day and generation, men are more selfish and thoughtless than ever before, women weaker, more harassed, and she need not be amazed if a sweeter old maid than myself feels uncharitably.

The truth is that the majority of men, as husbands, are failures. What an angel a man is before marriage, how crabbed and censorious after!

This carelessness is more perceptible among laboring men than others. Is there anything in tilling of mother earth that makes a man rough? There is something in it that gives him good health, and this very constant good health seems sometimes to make him unfeeling. How sad! It is the principle reason I did not marry some twen—some years ago. The world will doubtless lose other shining examples of what the married state *should* be unless these men can be brought to a realizing sense of their sins of omission.

If there are any discontented spinsters among the "RURAL" readers, let them look about and see how many husbands can sew on a button when the baby is crying; how few "knots" will bear the stress and strain of all matrimonial weathers, and a few other *items*, and they will be contented enough to be a perfect aggravation to ordinary people.

And the vexations of housekeeping!
Children with a thousand wants!
Sleepless nights and anxious days!
Husband cross as sin!
Whole life a struggle with dirt!
And one nervous little woman to wrestle with it all.

Ah! some of these husbands deserve——deserve to be in hearing of an old maid's voice, at its crucifying pitch, once a week! MISS IRENE.

THE "DON'T" SUBJECT.

I HAVE just been reading Miss Harvey's "Don'ts," and while I heartily endorse them all, I wish she had added one or two more. One suggested by a conversation overheard at an impromptu "farmers' pic-nic," I cannot refrain from sending you. "There comes Mrs. Mann, dressed up in black cashmere!" "You don't say—cashmere—to wear in the woods? Pretty extravagant, I think." Extravagant! I smiled to myself, for Mrs. Mann had told me she couldn't afford to wear any other than this three-year-old cashmere to "rough it" in, for, with delicate health and all the work of her household to do, prints "exquisitely done up," were altogether too choice for her, unless for the afternoon visit, or the home dress-up, where they would not be apt to get mussed quickly. But to come back to the pic-nic; nine of the fifteen women in sight had on cheap (?) dresses of cotton and wool in fancy goods, more or less mussed, and all made and trimmed elaborately; the wearers thereof priding themselves on their economy; why, that cashmere cost as much as three like theirs.—Did it? Count the cost and see. How much were the trimmings and the making, and how long will yours last? Think it all over, and you will find the cashmere is the cheapest. Here comes in my Don't, don't buy imitations in dress goods, looking just "like silk" and so cheap, for their beauty will have departed by the time they leave the dressmaker's hands, and one or two rides to church and a few drops of dew will make them just fit for pic-nics.

MILLY BIRD.

FASHIONS.

POLONAISE continue in favor. This style of wearing apparel undergoes slight alterations in the cut and trimming from time to time, but there is no prospect at present of its abandonment, and ladies who are obliged to economize will find it to their advantage to utilize material in this form; a change of looping or other slight alteration will remodel it. Skirts of different material are worn, so a pretty and useful suit may be constructed of two partly-worn dresses, if wished. The taste of the persons will dictate the combination. If possible, the contrasting colors should be such as will blend well.

Short skirts still hold sway, thereby revealing the sense of the ladies in their adoption and continuance.

Large hats of black straw are to be one of the leading styles for Fall.

The navy blue flannel suits which have been so popular during the Summer will continue to be worn. The material is inexpensive, some of it costing but fifty cents a yard for one and one-half yard width. It can be utilized for almost any time of the year.

Lace around the neck is generally arranged to fall downward over the dress. It is often pleated or gathered in the form of a deep collar, several rows being made.

In colors, old gold and cardinal retain their prominence. They are worn by those of advanced age, as well as the youthful.

Some of the celluloid bracelets in red and black are very pretty. The tortoise-shell are handsome, and the wearer of any of these displays better taste than those who adorn themselves with the cheap gilt. If *gold* can be afforded it is well to wear it, but better something else than the imitation.

FORFEITS FOR FUN.

A LIST of amusing forfeits, which will make the company laugh and not offend the person called upon to pay them, are herewith given:

1. Put a newspaper upon the floor in such a way that two persons can stand on it and not be able to touch each other with their hands. By putting the paper in the door-way, one-half inside and the other half outside the room, and closing the door over it, the two persons can easily stand upon it and still be beyond each other's reach.

2. To go out of the room with two legs and come in with six. Not difficult if one thinks to bring a chair along on the return.

3. To act the dumb servant. The person who has forfeit to pay must act out the answers to the questions put by the master of ceremonies. "How do you make bread?" "How do you eat soup?" &c. This forfeit will cause much merriment if proper questions are put.

4. Put one hand where the other can not touch it. One can get out of this difficulty by putting one hand on the elbow of the other arm.

5. Place a pencil on the floor so that one can not jump over it. May be done by putting it close to the wall of the room.

6. Put a question that no one can answer with a "no." This is not hard if one thinks to ask "What does y-e-s spell?"

7. Push a chair through a finger-ring. This forfeit is made by putting the ring on the finger and pushing the chair—any other object will do as well—with the finger.

8. Put yourself through a keyhole. This was a great puzzle to us for awhile, but when the word "yourself" was written upon paper and pushed through the hole it was all clear.—Cincinnati Weekly.

ABUNDANT HAIR.

JAPANESE women are very proud of their hair, which is black and luxuriant. They cultivate and arrange it with great care by brushing their tresses back from the forehead and gathering them in a plaited topknot, covered with flowers, spangles, and hairpins of gold, silver, and tortoise-shell. Rich and poor are alike proud of their *coiffure*, and the hull-woman in rags devotes the same attention to her hair as any great lady. To preserve the elaborate structure from being disturbed, women during sleep rest their necks on a padded fork. There is no difference between single and married women in wearing their hair, as in China; and their respective social status is indicated by the position of the bow in which the waist-scarf is tied, girls wearing it at the back, matrons in front. The latter likewise shave their eyebrows, and dye their teeth black. Girls use rouge freely, and sometimes gild their lips. They are all fond of smoking, and wear their embroidered tobacco pouches as belt ornaments.

ABOUT WOMEN.

"IT is not nice," says a correspondent, "to see a lady take the cup from the water-cooler in a railroad car and let her dog drink out of it." The correspondent is right; it is not nice, except for the dog.

A YOUNG American lady (Miss Perkins, of New York) has taken the black veil in the Dominican Convento the Rue Laugier, Paris. The ceremony took place, according to established usages, behind a double grating.

LADIES will be gratified to hear that there is a vast improvement in the style of bath-houses this Summer at Cape May and Atlantic City.

AT the commencement of the University of California, where both sexes are educated, the highest honors were borne off by two young ladies.

FRANCES E. BURNETT, author of "That Lass o' Lowrie's" and "Louisiana," is described as a sweet fascinating woman and a most delightful companion. She speaks of her stories in a way that is very refreshing.

MRS. N. K. ALLEN, of Iowa, a lady of leisure and means, has received the appointment as notary public and pension agent, in order to give her services to poor women who cannot afford to pay for such work. She has written bills, collected claims, and aided her sister women in many ways.

MISS MARY E. MASON, daughter of Hon. Silas Mason, and granddaughter of Rev. Hosea Ballou, died at Readsborough, Vt., recently. She was a lovely girl of twenty. She had but a short time prior to her death returned from Boston, where she had been taking violin lessons. She was one of the most accomplished players on the violin in that State.

FOLLOWING are the official rules for the mourning for the imperial family of Russia for the Empress: The Czar and all the Grand Dukes will appear in full mourning for six months, according to military law. The Grand Duchesses will wear during the first quarter a *robe montante* of flannel, with long cuffs buttoned to the wrist, collar and weepers of batiste. Trains of black flannel; crape bonnet, with head band lined in black taffetas two veils, one short, the other long, and covering the whole robe; gloves, fan and black *chaussures*. Not until the fourth quarter is silk permissible, and *coiffures* will then be white, with colored ribbons and colored gloves.

ADELAIDE NEILSON died in Paris on Sunday, Aug. 16. Her decease was sudden and is generally attributed to heart disease, but by some this is doubted. The death of this favorite actress will be universally regretted.

THE Troy Times has heard of a judge of much experience who says "he has never had a breach of promise case before him in which the mother of the girl did not know more about it than her daughter."

MRS. JULIAN HAWTHORNE, now residing in London, mentions the increased attention given to the decoration of the outside of London houses. They are now painted chocolate, and Indian red, and this must greatly relieve the dinginess of the streets in the English metropolis.

MRS. SARAH THOMPSON and her two daughters who have created so much talk by their peculiar actions in Albany, upon their return to New York proceeded to the St. Nicholas Hotel, and were assigned a room on the second floor. When the attendant appeared in the ladies' parlor to show them to the room the women broke into piercing screams and refused to leave the apartment. They were quieted after a while, but with much difficulty were removed to Bellevue Hospital for treatment, as they are evidently insane. Later intelligence is, that the mother and one daughter are improving—but, little hope is entertained for the other's recovery.

OUR VISITOR.

WE have been favored with a visit from our contributor, Margaret B. Harvey.

As personal descriptions often convey erroneous impressions, it will not be attempted in this case. Her interest in the "RURAL" ladies, is unabated, so our readers may expect still to be profited and entertained by her productions. R. C.

You will not be sorry for hearing before judging, for thinking before speaking; for holding an angry tongue; for stopping the ear to a tale-bearer; for disbelieving most of the ill-reports; for being kind to the distressed; for being patient towards everybody; for doing good to all men; for asking pardon for all wrongs; for speaking evil of no one; for being courteous to all.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ABOUT HOME DECORATIONS.

MAY MAPLE.

As a nation, we are noted for extremes, and the present generation—the feminine part of it at least—are seeing to what an extreme they can carry the art of decoration in their homes. Something more than a quarter of a century ago somebody made the discovery that it was the bare walls and poorly furnished rooms that caused so much dissatisfaction among the half-grown children, and made them so desirous of leaving the hearthstone for a life in some far-away city, and so for the last decade the great cry has been, "Make your homes attractive, and thus keep your children with you." Of course, those who had abundant means could adorn their homes with many luxuries. But still discontent lurks in every corner. Those who have limited purses are just as anxious to make their homes attractive; so they toil day and night to add a few shillings to the purse, or else work at unseasonable hours to make ornaments for parlor and sitting-room, till they become so nervous and irritable that a loud laugh or merry chatter among the younger fry brings down the severest reprimand from lips that might have been wreathed in smiles had it not been for the hurried embroidery of some fancy motto, the forming of some "air castle," or the painting of some bit of pottery. The more humble the home the harder must the mother toil to make it as attractive as her neighbor's; and yet with all this extra labor and self-sacrifice, the children turn with longing eyes to other places for amusement. And why is it? Are the children ungrateful and so unreasonable in their demands that neither luxuries, artistic displays nor self-sacrifice can satisfy them? I trow not. In fact, I believe it takes but very few of the "cultured" wants to satisfy the growing mind.

I have in happy remembrance a home of the long ago that was always full of happy, contented children. In additon to the original family of eight or ten young scions, there were always two or three nieces or nephews, children of some dead brother or sister, to be cared for by Uncle Alec or Aunt Ruth. Now, the old homestead was very plainly furnished; there were no hours spent in painful decorations. To be sure, the walls of the best room, which was also the family sitting-room, were hung with the portraits of a few of the prominent men of our country, and a home-made yarn carpet covered the floor. But in this home, where there was a houseful of boys and girls, no anxiety was ever expressed about leaving the old roof-tree, where *father* and *mother*, not papa and mamma, presided. In all the world there was no place so dear to those sons and daughters, nieces and nephews, as where they knew they would always be greeted with a smile, a kind word or a caress from that indulgent father and loving, sympathizing mother.

Even when the older ones married, there was no desire to go far away to "settle down." "We must live where we can run in and sit by the old fire-place," was the expression of each member of that affectionate group. The recipe in that family for "making home attractive" was, to *love* one another, and make the life an every-day demonstration of that love. The girls had no secrets from mother, and the boys were always sure of a father's sympathy and wise counsel; the household was ruled by love.

Love made home attractive; not elegant furnishings or beautiful paintings, or yet expensive musical instruments; not fancy mottoes that had taken weeks of almost stolen time to embroider, not scoured floors nor polished walls, but simply loving sympathy with each child's natural development, desires or ambitions, directing as much as possible the forces into the right channel, that there might be some assurances of success in whatever was undertaken when the child reached maturity. Make home attractive, your surroundings handsome, without becoming cross; but remember, if the father and mother are as attractive as they may be, the expense of keeping the children at home contented and happy, will not be burdensome.

DOMESTIC RECIPES.

Accepted.

If any of your subscribers want a reliable recipe for coloring butter and for preserving eggs I will give it in the columns of the RURAL NEW-YORKER, if it is asked for. Having retired from the butter and egg business I have no further use for *secrets* in that line. J. B.

Yes, we shall be pleased to have it.

Pickling Berries.

Heat the amount of vinegar required, sweeten, then turn in the berries, let heat through, then turn into a jar and set in a cool place. Simple, but I think they are much better than to spoil the berry flavor with spices. One lady of my acquaintance, in canning berries, never heats her cans. Setting them on a marble, she pours the scalding fruit into them, and says she never breaks a can that way, as the cans heat gradually from the bottom.

Lemon Pie.

There are many good ways of making the above, but I know of none that quite comes up to the following: Two eggs, juice and grated outside of one lemon, one cup sugar, one cup boiling water. Save the white of one egg for frosting. Beat eggs, lemon, sugar, and a tablespoonful of flour together, turn on this mixture the hot water, boil in dish of water; bake crust separate.

Fruit Pie.

A simple thing to speak of, but if all ladies have their pies "run out" as I have, they will not think a remedy so simple after all. For raspberry, blackberry, juicy green apple, etc. Spread the under crust with butter, then sprinkle thickly with sugar, then flour; put the flour under the berries, then sprinkle with sugar again, and bake slowly. By this means one can have the goodness of the pie *in* the pie, instead of the oven. AUNT EM.

QUESTIONS ANSWERED.

Piccalilly.

Aunt Em asks for a recipe for the above.

ANS.—Fifty small cucumbers, one large white cabbage, half a peck of green tomatoes, two quarts of small string beans, one dozen pieces of celery, three green peppers, four red peppers—seed taken out—two heads of cauliflower. Chop all quite fine and soak over night in strong salt and water. In the morning wash well, drain thoroughly and pour over hot vinegar, spiced with cloves, cinnamon and allspice. A teacupful of grated horseradish may be added to the mixture if liked. In 24 hours turn off the vinegar, scald, skim and return to the pickles. Repeat three or four times if left like common pickles, or seal air-tight while hot at the second scalding. Pure cider vinegar should be used and the vegetables must be fresh.

Martynia Pickles.

E. A. Douglass asks how and what variety of martynias to use for pickles.

ANS.—The variety proboscidea is used. Treat in the same manner as you would cucumbers. The young pods should be gathered when about half grown, while tender and succulent. If left until the flesh has hardened they are worthless.

Glass or Stone for Pickles.

Mrs. G. McF. asks the ladies to give their experience in keeping pickles in glass or stone. Which is best?

No Costiveness, Diarrhœa or any Bowel complaints where Hop Bitters are used.

News of the Week.

HOME NEWS.

MONDAY, August 23, 1880.

The reception to Gen. Grant, at Denver, on the 17th, concluded with a banquet at the Glenarm Hotel at which about 200 guests were present. Gen. Grant spoke for some time and with great interest throughout. He expressed the greatest surprise at the progress of Denver, and magnified its future and that of the State .....At Pueblo, Col., on Tuesday, Henry Orr, a railroad employe, engaged in driving piles, fell against the point of a crowbar, which passed through his body, killing him instantly.....The notorious Dr. John Buchanan, who for several years has been engaged in the manufacture and sale of bogus medical diplomas, in Philadelphia jumped overboard from a ferry-boat on the 17th, and was drowned ... .. A special from Santa Fe says: "The hostile Apaches, after crossing the Rio Grande, marched sixty miles into the interior and took their stand in the Sierra Candelaria Mountains, there they now are..... Secretary Evarts has issued to the several Powers having jurisdiction of ports likely to be infected by yellow fever or cholera a formal invitation to attend an international sanitary conference at Washington, January 1, 1881..... The government has given notice that the rules for the inspection of steamboats will be rigidly enforced hereafter.....Papers on the industrial growth of the country and specie payments were read before the bankers' convention at Saratoga Thursday. A resolution was also adopted asking Congress to stop the coinage of from two to four millions of silver monthly.....Horace B. Valle, while intoxicated, went into the saloon of Edward Troinaine, in East St. Louis, on Sunday night, got into a quarrel with Troinaine, and was shot three times by the latter and killed.....Sitting Bull is reported at the Poplar River Agency, near Fort Buford in Dakota Territory, and as making threats of hostilities in case he and his braves do not get provisions. Some apprehension of trouble exists. .....A passenger train was wrecked by the sinking of the trestle work on the East Tennessee, Virginia and Georgia Railroad, near Knoxville, on the 19th inst..... There is a growing discussion of the question as to whether the census of the Southern States has been correctly taken. The increase is believed to be too large to be legitimate.

A sensation has been created at Santa Fe, N. M. by the announcement of a rich mining strike in the Mexican village of Las Placitas, about thirty miles distant. The village is built of adobe huts and corrals, and the foundations or the houses are of rock. A prospector, Jesse Marbin, detected mineral in this rock, pounded it up and hammered some of it, getting a rich result in gold. He located the streets in town whence this gold rock was taken, and had assays made with the result of $4,600 in gold to the ton.....Miss Tillie Mateer, aged 18 years, was walking with a gentleman near Mount Joy, Pa., on the 18th, when a spark from the latter's cigar set fire to her dress and she became alarmed and started to run. A gentleman who was driving toward her jumped out of his carriage and wrapped a blanket around her, but she was so badly burned that she died shortly after.....Later details of the fire at Eureka, Nev., show that about 300 buildings were burned, including many business establishments. A space equal to 50 acres in the heart of the town was swept over, leaving only half a dozen buildings. The loss is estimated at $750,000, with $150,000 insurance.....Freeman F. Gross shot and killed Mike Fleming, at 103 Ewing street, Chicago, on Tuesday evening. Gross was attracted to Fleming's house by cries of distress, and found Fleming in the act of striking his wife with a chair. On Gross' appearance Fleming turned on him, and with an uplifted chair chased him from the house and along an alley. Gross, being hard pressed, turned and fired two shots at him with fatal effect. .....Carter was shot and killed in Porter's saloon, at Nashville, Tenn., on the 19th, by John Holcomb. Carter, who four months ago killed Holcomb's brother, was drunk, and had been searching for Holcomb, whom he threatened to kill. He was overheard by Holcomb to say he would send him to hell as he had sent his brother. Holcomb thereupon leveled a double-barreled shot-gun and fired a fatal shot, making sure of his work by firing two pistol balls into Carter's body, though the gunshot killed him.....S. B. Alexander was arrested at Waco, Texas, on the 18th, by officer Joe Ballard. Being released, Alexander went in search of Ballard, and a difficulty ensued in which Ballard was fatally wounded.

Two bold Canadians have published in the Welland (Ont.) Telegraph, a proposition to go through the whirlpool rapids of the Niagara river, from the Falls to Lake Ontario, for $1,000, using an open Hudson Bay canoe. The famous Maid of the Mist is the only boat that was ever known to pass the rapids .....The event of the season at the Greenbrier Springs was a grand leap year dress ball given by the ladies on Friday night and a sham battle on Saturday morning by a portion of the First Virginia Regiment, in camp near the Springs. ....."Medical Lake" is the name of a resort near Spokane Falls, Washington Territory, which is being visited this season by Pacific coast people. The lake is nearly round, being a mile and a half long and over a mile wide, and is sheltered on all sides by immense forests of pine and fir. The water is clear, of a dark color and so buoyant that it will sustain the weight of a man without any exertions whatever. There is no animal life in the lake except a species of jelly-fish. Ordinary trout or any other kind of fish die immediately upon being placed in the water.....Postmaster General Key arrived at the Greenbrier Springs on Saturday night. General G. T. Beauregard, of Louisiana, arrived also. Among other notable visitors there are General B. T. Johnson, of Baltimore; Governor Mathews, of West Virginia; Judge T. C. Manning, of Louisiana, and General Garey, of South Carolina. The Springs are unusually crowded, as is also the entire circle of summer resorts in the mountains.....John Kelleher, residing at Oakland, Cal., with his wife and neighbor, Mrs. King, indulged in a drunken carouse on Sunday night, in the course of which the house was set on fire. Two of Kelleher's children (Eugene and Annie, aged two and five respectively) were burned to cinders. James, aged four years, was burned fatally, and Mrs. Kelleher will probably die from her injuries. Mrs. King was badly scorched and Kelleher slightly hurt..... At midnight on Sunday John Karin, a saloon keeper on the Abbott road, near Buffalo, N. Y., was fatally stabbed by Martin Flanigan, a boarder, who, while drunk, arose from his bed room and stabbed him with a common jackknife, in the presence of his wife and child. Karin died in a short time.....The preparations for the celebration of the centennial anniversary of the capture of Major Andre, which is to take place at Tarrytown, N. Y., on the 23d of next month, are being vigorously pushed forward by the committee having the matter in charge.

THE BENDER FAMILY.

The Benders are now believed to have been lynched at the time of the discovery of their last murder in 1873. One who witnessed the lynching says that the notorious Bender family, four in number, were captured soon after the discovery of the murder of Col. York's brother. He says the four were stood up in a row, facing nine riflemen, and were told their fate, that Kate was pluck to the last, and called upon her captors to "shoot and be d——d," and that the four bodies were buried at the corner of the counties of Labette, Wilson, Neosho and Montgomery

BURNING OF A FLOURING MILL.

The Yaeger flouring mill the largest and costliest establishment of the kind in St. Louis having thirty run of burrs was burned on the night of the 18th. The mill was in operation, and the fire is said to have caught from over-heated machinery. The mill was built about three years ago at a cost of $200,000, since when some $50,000 of improvements have been added. It was insured for $285,000 in from eighty to ninety companies, mostly Eastern and foreign. The loss on the mill, machinery and contents is estimated at $400,000. There were about forty thousand bushels of wheat in the mill. Twenty-eight box cars on the tracks in the rear of the mill belonging to various companies were burned. Some of them were loaded with grain. William Weinbermer, one of the millers, was in the upper part of the mill when it took fire, and, being unable to escape by the stairway, leaped from the fourth story window and was fatally wounded. The destruction of surrounding property and individual losses will make an aggregate loss by fire and water of fully $500,000.

POLITICAL.

Ex-Governor James E. English of New Haven was nominated for Governor of Connecticut by the Democratic Convention at New Haven on the 18th.....Frederick A. Potts of Hunterdon was nominated for Governor of New Jersey by the Republican Convention at Trenton on the 18th. ..... The Democrats of the Seventh Kentucky district have renominated Hon. J. C. Blackburn for Congress.... ...The Indiana democratic central committee opened the campaign on Saturday with 200 speakers in the various cities and towns in the State.....While all the little organs in both parties are modestly telling just how the elections are going a man like Senator Bayard has the assurance to say that it is too early yet to predict with certainty.....Hiram Warner, Chief Justice of the Supreme Court of Georgia, has resigned his position.....Landers, the Democratic candidate for Governor of Indiana, has accepted the Republican candidate's challenge for a joint debate. The exact time for "the collision of intellects" has not yet been arranged.

The Prohibitionists expect to have electoral tickets in about twenty of the States.....Governor Cornell thinks, or at least he says he thinks, that Garfield will carry New York.....United States District Attorney Woodford, of New York, is among the stumpers in Maine.....Ex-Secretary Bristow refuses to say anything about McDonald's revelations concerning Grant and the St. Louis whisky ring.....Ex-United States Senator Norwood has consented to run for governor of Georgia in opposition to Governor Colquitt, who received the indorsement of the late gubernatorial convention..... A Republican landlord, in Berlin, Vermont, has twice torn down the Hancock and English flag of his Democratic tenant and the case is going into court.

THE INTERNATIONAL EXHIBITION.

The first session of the United States Commission appointed under the act of Congress to carry out the plans for an International Exhibition to be held in New York in 1883, have met and made a preliminary organization and subscription books are immediately to be opened for the first million dollars necessary to begin the work of preparation. Joe Starkey, of Davenport, N. Y., a fisherman, while carelessly handling a pistol, discharged it and killed his wife. He has become insane..... .. George Milligan fell from a load of wheat near Burlington, Iowa, on Friday and was impaled on a stake. He died a few hours afterward.....A bite on the ball of the thumb by a kitten with which he was playing killed E. L. Bradley, of San Jose, Cal.. -....Charles Fegley, 11 years old, of Maxatawny Township, Pa., was thrown in front of a reaper and cut to pieces.....Charlie Conners, a boy of nine years, of Bangor, Me., ran a rusty nail into his foot and died of lockjaw on Friday.....William Wright, a farmer at Ballston Spa, was so gored by a bull on Thursday that it is thought he cannot recover.....A son of Galen Bray, of Worthington, Ind., stepped on a piece of glass, cutting his heel so severely that he bled to death before the flow could be stopped....

A sting of a bee on his neck is said to have caused the death of George Russell of Blackhawk County, Iowa, by producing paralysis of the heart. .....K. E. Parkhurst, the young lawyer who killed Miss Fannie Howell in the Nichols House in Bath, Steuben County, N. Y., on the afternoon of August 14, and then killed himself, was declared to have been insane by a Coroner's jury, Aug. 21st, on the testimony of Dr. Dolson and other physicians of the town.....A man in Louisa County, Iowa, who died quietly in his bed last week, escaped death narrowly many times during his career. Once he was stabbed in the stomach and given up by the physicians. At another time he fell into a well sixty feet deep; again, he was gored by a bull until life was apparently extinct, and more recently a loaded wagon passed over his head, cutting off one ear.

FOREIGN.

In England the Hares and Rabits Bill, the effect of which, if passed, would relieve tenants from the losses caused them by these animals, has been advanced a stage; but although the government seems determined to push it, yet the season is so far advanced, that it is thought to be hardly likely to pass at this session of Parliament. Organizations are being formed, chiefly in the large towns, for the purpose of public agitation with a view to the suppression of the House of Lords and the substitution therefor of an elective Senate. Mr. Gladstone is still weak, though he attends to some business. Born in 1809, he has already reached the three score and ten years assigned to man, and no contemporary in public life in any country has worked harder, so that it seems he should now either take a rest or retire to the quiet labors of the House of Lords.

In Ireland the land and Fenian agitation is still kept up vigorously. Tenants refuse to pay rent, and threaten terrible things if evicted, sometimes carrying their threats into action. There is a great deal of secret drilling of men with a view to an ultimate rebellion; active emissaries, chiefly from this country, are busy exciting the peasantry; and arms are being smuggled into all parts of the country. While biding their time to go to war with England, faction fights are waged, if anything, more bitterly than usual, those between Catholics and Orangemen being by far the fiercest. So threatening has of late been the aspect of affairs that, besides the addition of new troops to those stationed on the island, Mr. Foster, Chief Secretary for Ireland, has lately made a hurried visit to it to investigate what further steps may be needed to prevent or suppress an outbreak. For the present no new powers will be sought by the government, but the existing laws will be rigorously enforced. Crops are fine and the weather splendid.

A reinforcement of 1,150 men left England for Afghanistan last Saturday. The troops besieged in Candahar have sustained several assaults from the Heratees, or forces of Ayoob Khan; and by the latest cablegram they have just made a vigorous sortie, inflicting heavy losses on the besiegers. The Khan is not only raising works against the city, but entrenching his own position with the intention of giving battle to the troops on their way to raise the seige. These are pushing forward steadily under Gen. Stewart from Cabul and under other commanders through the various passes from India. The new Ameer is still on friendly terms with the English, who for the present must suppress their doubts of his fidelity.

In France Minister de Freycinet, chief of the Cabinet, last Thursday made a notable speech at Montauban. In it he declared that the late elections for the Councils-General had so firmly established the Republic, that the laws against the religious orders would not be enforced except in so far as the Jesuits are concerned. Disregarding impolitic counsels he declares that the Republic is ready to accept all sincere adhesions, however tardily made. "France," he goes on to say, "has determined not to be dragged into war. At the same time she has no intention of abstaining from taking part in affairs of international moment." The radicals are displeased at the moderation of the speech, deeming a more violent policy better; the Monarchists and Imperialists don't like it because it lessens their hopes of seeing their favorites on the throne; but moderate men are highly pleased by it..... Religious pilgrimages are still popular. Eight thousand pilgrims left Paris on 19th for Lourdes.

In Russia Nihilism is for the present at any rate put down, and Prince Louis Melikoff who, sometime back, was entrusted with supreme power for its suppression, has been appointed Minister of the Interior instead of virtual Dictator. He accomplished his object mainly by appealing to the chiefs of the organization personally. Many of them have been taken into government service either at home as spies and petty officials, or abroad in the same capacity. Most of the Nihilist chiefs were poor, and being now provided for, they don't feel ready to risk their bread and butter. Those who have nothing to lose are the readiest revolutionists.....The difficulty between Russia and China seems in a fair way toward amicable adjustment.

The problem of Turkey's relations with her neighbors is still in the same condition as it has been for some weeks. The Porte still procrastinates with Montenego and refuses to make the required concessions to Greece. Servia, to be ready for any emergency, has just ordered 100,000 rifles of the newest American pattern, to be delivered before the end of this year. This little State has now an army of 25,000 regular troops, and 215,000 militia. Should war break out Servia, Bulgaria and Roumania, trans and cis-Balkan, will probably unite to get each the largest possible slice of Turkey. Just now, however, there is no immediate prospect of the outbreak of hostilities, although all the southeastern part of Europe is in a warlike condition.

All your own fault if you remain sick or out of health, when you can get Hop Bitters.

AGRICULTURAL NEWS.

THE most disheartening accounts of the condition of crops come from Silesia, Posen and East and West Prussia. Extremely heavy rains have caused the rivers to rise unusually high, sweeping away gathered crops, fences, stock, bridges and frequently, houses besides drowning many persons. Railroad embankments are swept away, villages flooded, and vast tracts of farm land converted into swamps and quagmires. Throughout nearly all those broad regions the harvest has been almost entirely destroyed, wheat being entirely ruined, so that the official estimates of the German harvest lately noticed here will have to greatly lowered. Government aid has been earnestly invoked in behalf of the suffering poor, and the usual military reviews and other operations will not take place this year.....Wet weather is once more threatening to ruin the British harvest and has already greatly injured it..... The taxes levied directly on the soil in Italy amount to $40,000,000, being at the rate of $1.60 for every acre of cultivated land. The land is so heavily mortgaged that the sum total of these incumbrances amounts to $2,250,000,000. No wonder poor farmers and agricultural laborers are flocking thence to this country.... ...Russia has added to her duties on importations of foreign meat and live stock, making them prohibitive so far as we are concerned.....The Agricultural Department puts the number of our hogs this year at 35,034,100; last year the report gave us 34,100,200; and 52,262,500 in 1878.....Last year the price of wheat in Great Britain advanced steadily, almost week by week, from the first week in January to the first in November, after which there was a gradual decline.....France is to have a show of fat cattle, living and dead poultry, etc., next year, at Paris, from the 14th to the 23rd of February. In this show pigs will be divided into three classes—French breeds, pure and crossed between themselves: foreign breeds, pure and crossed between themselves; animals proceeding from crosses between French and foreign breeds .....Wool has been so cheap in England that the Duke of Richmond could get no buyers at Chichester for the fleeces of his famous flock of South Downs which generally command high prices and ready sales.....Despite their poor outlook English farmers are taking heart from the fact that between January and June this year only 676 failures have occurred among them, while last year between the same dates there were 1,431 failures recorded.....At the Lexington, Ky., fair August 6 the Central Ky., Sheep Breeding Company sold of Southdowns, 15 ewes and three rams at $226, and of Cotswolds, 76 head at $12.70; average for 95 head, $15.53; $51 seem to have been the highest price paid for a single buck—a Cotswold.....On Tuesday last, the 17th, the Agricultural Department furnished the following summary of the condition of crops. Potatoes.—The New England and Middle States report a high average crop. The Gulf States and three States in the Mississippi Valley report an average above that of last year. The States north of the Ohio River have a promising crop. West of the Mississippi both Kansas and Nebraska report a low average. Buckwheat—New York and Pennsylvania show a decline of two per cent. in the acreage sown. Minnesota and Nebraska report an increase in acreage and the other States show an acreage nearly the same as in 1879. Hay and pasturage—the Summer has not been favorable for the hay crop. In the States bordering on the Ohio River the average is higher than last year. West of the Mississippi the average is low and on the Pacific Slope it is very high ..... Wise county, Tex., last year grew two bales of cotton, worth $40 per bale, to each inhabitant. .....H. M. Caldwell, a North Carolina horticulturist, grows stoneless peaches by grafting upon plum trees .....Nova Scotian exporters of cattle to England are proposing to build a steamer especially for the purpose of carrying cattle. By this means they hope to avoid a large part of the heavy expenses now attending the business.

Of late years there has been a steady falling off in the number of English cattle and sheep. In 1875 the number of English cattle was 6,012,024, while in 1879 it only reached 5,856,356; in 1875 the number of sheep was 29,167,433, which had fallen off more than a million last year. Nor was this decrease owing wholly to the importation of American cattle on the hoof, since the total import of cattle and sheep from all quarters, including Ireland, was in 1879, 2,986,251, while in 1878 it reached 3,043,090. In the last year English native cattle and sheep had fallen off nearly 1,500,000..... The American Consul at Geneva says that American beef and live stock have penetrated as far as that region, and the value of choice cattle raised in large numbers in Switzerland for the Paris and French markets has been sensibly diminished by the importations from America..... From a tabular statement of the number of domestic animals of the State of Iowa, compiled in the office of Hon. R. R. Sherman, auditor of State, we take the following figures: Total number of cattle in state, 1,745,149 head; value, $18,445,957. Total number of horses, 649,797; value, $20,247,884. Total number of sheep, 356,846; value, $423,886. Total number of hogs, 2,466,985; value, $4,652,601. Total mules, 43,160; value, $1,527,353.....Commissioner Le Duc will make a personal examination of the results of artesian well boring for agricultural purposes, ordered to be made on the Western Plains.....Of the 37,000,000 people in France, 18,968,000 are engaged in agriculture, or a trifle over one-half, according to a late report of the Minister of Agriculture and Commerce. There are 10,000,000 land-owners, and 6,000,000 tenants, while 2,000,000 are classed as market gardeners, vine-culturist, etc.....Just a week ago, on August 16, a heavy white frost visited most parts of Delaware and Dutchess counties, N. Y., and the Catskill Mountains, doing considerable damage to cucumbers, tomatoes and late garden truck, as well as to corn and buckwheat, the latter of which is usually a large crop in Delaware county .....The

National Fair Association to be held at Washington, D. C. October 5-16, promises to be of more than usual interest. A new revised premium list is now ready, and will be furnished upon application to Root McCeney, Assistant-Secretary, Washington, D. C.....

The following, among other subjects, are suggested for the consideration of the convention to be held in Philadelphia on Sept. 22 to promote the sheep and wool industry: Advancement of the general interests of the wool-grower; prompt and systematic collection and distribution by the Agr'l. Dep't. of information concerning the supply of flock products and the demand for them; relative to advantages of our sheep-breeding States and the breeds best adapted to them; methods of shearing and handling sheep, and of packing and grading wool for the market; increasing the production of the mountain lands of the Atlantic States by the systematic extension of sheep husbandry; benefits resulting from the introduction of pure blood into our native flocks; breeds capable of yielding from a given acreage the most profitable returns in mutton and wool taken jointly; management of sheep in Summer and Winter—of lambs most profitably for market; recent inventions in wool manufacture and their relative importance; recent discoveries and inventions in the production of dyes and the art of dyeing—their relative importance; grades of wool which the country must produce in order fully to supply the demands of her looms, and how best to produce them..... Germany produced last year 410,000 tons of beet sugar; Hungary, 385,000 tons; France, 270,000; Russia, 225,000, and Belgium, 85,000.

Burnett's Flavoring Extracts. — *The superiority of these extracts consists in their perfect purity and great strength.* They are warranted free from the poisonous oils and acids which enter into the composition of many of the factitious fruit flavors now in the market.

Have you found the key to perfect health and strength? It is Kidney-Wort, the only remedy that overcomes at once the inaction of the kidneys and bowels.

Do not give up,—hundreds that have suffered for years from Kidney diseases have been cured by Kidney-Wort.

Twenty Years a Sufferer.

DR. R. V. PIERCE:—DEAR SIR—Twenty years ago I was shipwrecked on the Atlantic Ocean, and the cold and exposure caused a large abscess to form on each leg, which kept continually discharging. After spending hundreds of dollars, with no benefit, I was persuaded to try your Golden Medical Discovery, and now, in less than three months after taking the first bottle, I am thankful to say I am completely cured, and for the first time in ten years can put my left heel to the ground. I am, sir, yours respectfully,
87 Jefferson St., Buffalo, N. Y. WILLIAM RYDER.

Write to MRS. LYDIA E. PINKHAM, No. 233 Western Avenue, Lynn, Mass., for pamphlets relative to the curative properties of her VEGETABLE COMPOUND in all female complaints. For sale by all druggists.

Use Hop Bitters once and you will use no other medicine. Test it.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug 21, 1880.

BEANS AND PEAS.—The market for beans is strong not so much on account of the volume of sales as of the good control of stocks. Black beans are without a bid. Green peas are seeking a market from the West at $1.65. Some holders still ask $1.70 for prime.

Marrow beans, prime, $1.67½@1.70; other, $1.55@1.65; medium, prime $1.45@1.47½; other, $1.35@1.42½; pea, $1.30@1.70; white kidney, $1.70@1.90; red kidney, prime, $1.55; fair to good, $1.40@1.50; Lima, Cal., $5.

BUTTER.—There is only enough local trade to regulate prices and extreme rates are not named for round commercial parcels. Receipts are light, but that there is not a good quantity made and making but farmers have laid too much stress upon the strong figures of a several weeks ago, and they have made a brief mistake in holding for a rise. The New York market is running differently from other Summers. One feature of disadvantage is a large loss of Eastern demand. The early low prices sent a good many cash New England buyers into the dairy sections, and many invoices which used to offset dull Summer days by a commission or moderate profit, are now shipped right through to populous points eastward. Exporters are taking a fair share of the Western and some of the stored stock; and to some extent these transactions have stiffened quotations for good useful under grades. A notable point of the season is the absence of very common butter, nothing is poor enough to go below 11½c. For extra selections of State the market is better, but there is no prospective advance for lines of State or Western.

Creamery, finest, 25@27c.; good to prime, 23½@24½c.; fair to good, 22@24½c.; sweet cream, fair to prime, 23@25c.; State firkins, 21@24cc.; pails and half tubs, best, 24@25c.; fair to prime, 21@23½c.; poor, 17@19c.; Welsh tubs, extra, 22@23c.; other, 18@20c. Western imitation creamery, 17@21c.; dairy, fresh, 20@21c; fair to prime, 17½@19c.; poor to fair 16@17½c. factory best 19@20c.; fair to good 16@17c.; poor, 14½@15½c.

Receipts for week, 29,560 pkgs.; exports for week 15,05 pkgs.

COTTON—Rules stronger and more active. Latest prices are for August, 11.33@11.39c.; September, 11.33@11.34c.; October, 10.83@10.31c.; November, 10.70@10.71c.; December, 10.71@10.72c.; January, 10.83@10.84c.; February, 10.96@10.98c.; March, 11.09@11.11.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

CHEESE.—The market has been unsettled but on the whole tending to a little stronger basis, with increasing export demand toward the close. Shipments have been 58,840 boxes. The bulk of the sales have been at 11½@11¾c. for fancy, closing at 12c.

Quotations are: State factory, fancy, at 12c.; do. good and prime, 10½@11c.; do. fair to good, 9¼@10½c.; do. h'f skimmed, 8@9c.; Wisconsin factory, fine, 11@11¼c.; do. good to prime, 10¼@10¾c.; do. fair to good, 9¼@10¼c.; Ohio factory, fine, 10¾@11¾c.; do. good to prime, 9¼@10¼c.; do. flat, fair to good, 8½@9¼c.; do. poor to fair 7½@8½c.

Receipts for week, 60,183 boxes.
Exports, 67,000 do.
Liverpool cable, 59s 6d.
Steam, Liverpool, 40@45s.

DRIED FRUITS.—The new fruits come in slowly the demand is quick and prices are doing better. The offerings thus far are almost entirely of blackberries, cherries and raspberries. Apples would receive considerable attention. Quotations are for

Apples—Evaporated choice, ring cut, 13½c.; evaporated, fair to prime, ring cut, 12@13c. State, 1879, fine cut, 6@7c.; State, 1879, quarters 6@6½c. Western, 1878, 3½@5c. Peaches—North Carolina, good to prime, 12@14c.; Georgia peeled, fair to prime, 11@13c; Georgia, peeled, poor to fair, 6@10c. Plums—State 1879, black 15@17c. Blackberries—1880, prime 6¾@7c. Cherries—Southern, 1880, 13c. Raspberries—1880, prime, 26½c.

Exports for week, 230 bbls. dried apples.

EGGS.—Receipts for week, 5,915 bbls.; do last week 6,200 do. Light receipts of fresh have run up prices, and a favorable feature of the week's business is the fair cleaning out of stored stock. Good supplies are looked for next week, but the market is in a better shape than before to hold them if they arrive in good order.

Near points 13c.; State and Pa. 18@18½c.; Western and Canadian fresh 17@17½c.; under grades 16@16½c.

FEED.—Sales of 40 to 60 lbs at $15@15.00; 80 lbs. at $16@17; 100 lbs. at $18.50@20.50; sharps at $21@22.50.

FLOUR.—The arrivals have been larger and there have been free sellers with prices lower and easy. Exports for the week have been 11,300 bbls, and 69,700 sacks.

Latest prices are $3.30@4.00. for inferior to very choice superfine State and Western; $3.90@4.15 for poor to good extra State and Western, odd lots and lines; $4.15@4.35 for very good to choice do.; inferior to good white wheat extras, $4.65@5.35; good to choice do. at $5.35@5.85; (very choice to fancy do. held at higher figures;) red and amber winter wheat inferior to choice trade and family, at $4.10@5.10; round hoop Ohio, $4.15@4.65; and trade and family brands of do. at $4.70@6.00; St. Louis at $4.60@5.45 for inferior to good extra; $5.35@5.85 for good to choice (very choice to fancy brands hold higher); Minnesota clear, inferior to fancy at $4@6.25; Minnesota "straight," poor to fancy, at $5.75@7.50, and patent inferior to very fancy at $5.75@6.50; unsound stock at from $2.25@4.85; city mill extra at $5.50@5.85 for good to very choice for the West Indies; do. for England, $4.00@4.40 for poor to choice spring wheat, and $4.60@5.00 for winter wheat product; do. trade and family extras, $5.50@6.75; do. for South America, $5.60@5.90; No. 2 at $2.35@3.00 for poor to choice.

Receipts for week, flour, bbls. 137,156; corn meal, do. 3,200; wheat, bush. 1,371,670; corn, do. 1,514 400 oats, do. 224,900; rye, do. 14,200; malt, do. 55,100; beans, do., 2,125; rice, pkgs. 400.

Exports for week, flour 59,600 bbls.; corn meal, 3,400 bbls.; wheat, 2,115,250 bush.; corn, 1,297,675 bush.; oats, 1,550 bush.; beans, 975 bush.; peas, 550 bush.; rice 545 pkgs.

FRESH FRUITS.—Export apples, 12,850 bbls. This is an unusual quantity of tender Summer stock to send abroad, but the market has been so low that shippers could hardly miss coming out whole if any of the shippings stood the voyage at least decently. A good many cheap sorts remain, but showy varieties give the market a better price-tone, especially for retail use.

Sweet bough, $1@1.50; Orange and Nyack pippins, 75c.@$1; Alexander and Coxsackie, $1.25@1.50. 2ll oz., Malden's blush, Gravenstien and Strawberry, $1@1.25. Demand running high for colored stock. Peaches bring only fair prices; extra N. J., 75c.@$1.75; poor, 35@60c.; Del., extra Crawford, 90c.@1.12; stumps, extra, 75@80c. Bartlett pears are variable in quality at this season and the range for bbls is wide; some selected of even hardness have sold at 4@3. Stock lots quoted: Bartletts, choice, $6.50@7; other, $3@5.00; Buff and Sugar Top, $1.50@2; sour Bell, $2.25@2.50; Southern Bartletts have up steady sale, crate, $1@1.75; cooking pears, $1.75@2 per bbl.; California fruit as before. Plums show a good offering; varieties are in early; sales are good, notwithstanding receipts anticipate the present demand. The full list quoted Quackenbush, $@@7 ₱ bbl.; Bradshaw, $5.50@6.50; Reine Claude, $4.50@5; egg, $5@5.50; green Gage, $4 50@5; Lombard, $3.50@4; blue Gage, $5.50@6.00; purple egg, $5@5.50; Bullet, $2@2.50. Grapes in good demand: Delewares, cases, 50 lbs, $5@6; up-river, bulk, 2@3c.; Concords, cases, 50 lbs., $2@3; Concords, in bulk, 3@4c.; Hartford, 3@3½c.; cases, $2@2.50. Whortleberries, 75c. ₱ ½ bush. Nutmeg melons, Buckensack, $1@1.75; Keyport, 35c.@$1. Watermelons, extra, $18@20 per 100; other, $5@12. Hothouse grapes, Black Hamburgh, 25@60c. ₱ lb.; Sweet Water, 20@30c. Peanuts lower, dull and weak; handpicked Va., 5@5¼c.; extra prime, 4½c.; good to prime, 3¾@4c.; common, 3@3½c.; shelled, 5@5½c.

CORN MEAL.—Sales at $3.20@3.25 for Brandywine and $2.50@2.75 for Western.

GRAIN.—Wheat has been active at variable prices, closing firm. Exports for the week have been 2,100,000 bush.

Latest prices are for No. 1 white at $1.07½@1.08; do., August, at $1.07¾@1.08¼; do., September, at $1.07@1.07½; do., October, at $1.07¼; do. steamer grade, at $1.03¾; No. 2 white at $1.05; ungraded white at $1.01@1.08¾; No. 1 red at $1.10@1.10¾; No. 2 red at $1.07½@1.08; do. August, at $1.07½@1.08; do., September, at $1.07¾@1.08; do. October, at 1.08¾@1.09; do. steamer grade at $1.05¾; No. 3 red at $1.03@1.05¾; do., steamer grade, at $1.01¾; No. 4 red, at $1.01; ungraded red at 85c.@$1.08; mixed winter at $1.05@1.05¾; No. 2 Chicago and Milwaukee spring at $1.03@1.05. Rye is in demand; quoted at 85c for No. 2 Western. Corn is active and fair; shipments for the week, 1,200,000 bush.; latest prices are for New York No. 2, at 50¾@50¾c.; do., August, at 50¾@50¾c.; do., September, at 51¾@51¾c.; do. for October, at 52¾@53¼c.; ungraded mixed Western at 50@50½c.; No. 2 white at 55c. bid. Oats are strong and active; sales of No. 1 white at 45c.; New York No. 3 white at 45@47c.; No. 3 white at 41@42c.; New York No. 2 at 40@41c.; do., August, at 36c. bid and 37½c. asked; do., September, at 35½c. bid and 36c. asked; do., October, at 33½c. bid and 36½c. asked; No. 3 at 37@38c.; ungraded White Western, 40@43½c.; ungraded mixed Western at 38@41c.; white State at 46@47c.; No. 2 Chicago at 41c.

HAY AND STRAW.—There is a very good call for supplies and prices quite firm although the receipts increase.

Shipping hay quoted at 80@85c.; medium to prime do., 90c.@$1; salt hay at 65@70c.; clover do. at 70@80c. Straw at 85@90c. for long rye; 55@65c. for short rye; and 55@60c. for oat.

Exports of hay for week, 1,475 bales.

HOPS.—Export demand has been fair, and the shipments for the week have been 1,300 bales. The increased business has been brought about by lower prices. Quotations are for

	Cents per ℔.
New Yorks, choice	26 @27
New Yorks, fair to medium	24 @25
Yearlings	7 @14
Olds, all growths	4 @ 8
Pacific Coast, new	23 @25
Pacific Coast, olds (nominal)	5 @ 8

LEATHER.—Quotations are for hemlock sole, 22@23½c. for light; 23½@25c. for middle; 22½@24c. for heavy; 20½@22c. for good damaged.

OIL CAKE.—Western is quoted at $30 ₱ ton.

POULTRY AND GAME.—Several cool days started a demand and the market has ruled stronger. Chickens and fowls have advanced 1c. Ice-packing must not be omitted.

Turkeys, choice light ice-packed ₱ lb. 14@15½c.; fair to good, 12@13c.; Phila., dry-picked, 14@16c. chickens, Phila., large, 19c.; small, 16@18c.; State scalded, 15@16c.; Western, 12@14½c.; Fowls, Phila., dry-picked, 14@15c.; Jersey, 14c.; do. scalded 13@13½c; Western, prime 12@13c.; other, 10@11c.; Ducks spring 13@16c.; scalded 13@14c.; mixed 11@12c.; squabs white ₱ doz., $1.75; dark, $1.25

Live fowls and chickens have arrived lightly and have had a quick sale at higher prices. With coops well cleared out the market closes strong.

Chickens, Jersey, ₱ lb., 13@14½c; Western 12c.; Southern, 11@12c.; fowls, Jersey, 12@12½c.; Western, 11@12c.; Southern, 11@11½c.; roosters, 5@6c.; turkeys 12@13c.; ducks, clear points ₱ pair, 55@75c.; Western 40@50c.; Southern, 40@45c.; geese, New Jersey $1.50@1.75; New York and Pa. $1.25@1.50; Western, $1 12@1.25; Southern, $1@$1.12; pigeons, 20@35c.

The new kinds of game sell readily.

Woodcock, 90c.@$1; prime English snipe $2@2.25; Grass plover, $3@3 25; wild pigeons, stuffed, the only sort now inquired for $1.50@1.62.

PROVISIONS—Hog products have been active and advancing sharply under the situation of affairs at Chicago, where a leading house has control of the bulk of the stocks. The "shorts" covering have advanced the excitement, and the market leaves off very feverish.

Mess pork closed at $15.80 bid and $15.85 asked for for August and September delivery, and $15.90 bid and $15.95 asked for October delivery. Bacon at 8¾@9c. for long clear and 9¼@9¾c. for short clear. Beef hams at $21.50. Beef—Extra India mess quoted at $15.50 for city; $10 for extra mess and $9.50 for plain mess; $10.50@11 for packet, and $11.50@12 for family mess. Tallow at 6¾c. for prime. Stearine at 9@9¼c. for choice.

Receipts for week, beef, 500 pkgs.; pork, 2,700 bbls.; cut meats, 28,500 pkgs.; lard, 14,600 pkgs.

Exports for week, beef, 1,720 pkgs.; pork, 3,100 bbls.; cutmeats 9,596,310 lbs.; lard, 3,656,550 lbs.

SEED.—Clover is firm; quoted at 8¼@8¾c. for prime. Timothy is quiet at $2-75@2.90.

TOBACCO.—The market has been moderately active only and without important change. Quotations are for

VEGETABLES.—Exports of potatoes for week, 6,725 bbls. The demand is good- but supplies are so general that prices favor the buyer. Easy rates, however, start a good Cuban demand and keep down surplus. Early rose, prime, $1.50@1.75; fair, $1.25. Maine and N. J. Peerless, $1@1 50, Sweet potatoes, Del. River, $2.75@3.25; Va., $2.25@2.50. Green Corn active when prime. Onions dull; recent high prices have brought in a good many Western, which are quoted. Tomatoes have had a good run during the week for canning purposes, the price being favorable. Cucumbers, per 1,000, $3@4; pickles. ₱ 1,000, $1.25; egg plant, per bbl., $1@1.50; string beans, per bag, 35@50c.; Lima beans, ₱ bag, $1.25@1.50; potato do. $1.75; turnips, 100 bunches, $3@4; turnips per bbl., 50c. @$1; beets, 100 bunches, $1.50@2; bull nose peppers, per bag, $1.50; cabbage, $5@8; red do., $6@9; squash, marrow, 5@@75c.; Onions, yellow, $2.75@3.25; red, $2.75@3; Western, $2.50@2.75; carrots, ₱ 100 bunches, $1,50@2; okra, per 100, 15c.

WOOL.—Trade has been very slack again this week and prices have ruled rather easy for other than medium grades. Quotations are for

Ohio, Penn., and Va. XXX and picklock, 48@50c XX, 45@47c.; X, 44@46c.; No. 1 47@49c.; No. 2 43@45c.; common 40@42c.; combing 44@50c.

Mo., Ky. and Tenn., washed fleece 42@46c.; unwashed fleece 30@36c.; unwashed combing 30@37c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 21, 1880.

BEEVES.—Receipts for the week 13,164 head; do. last week, 11,405 do. The week has been unfavorable for business, and at the close few wholesale purchases were made. Poor Southern and then grass stock sold at 6½@7½c. dress 55 lbs.; fair to prime native steers ranged at 7½c. to dress 55lb. to 10½c. to dress 57 lbs. Quality of stock remarkably fine for Summer. About 100 head of prime heavy steers went to near-by watering place hotels. Wednesday's rates were supported for first class cattle, but low grades were all attended with concessions.

COWS AND CALVES.—There is no variation from the usual dullness of August here, and prices range $25@55. with no drove lots touching $50 and upwards. A cheap Fall for cows is oeared, as receipts are likely to be heavy owing to moderate wintering crops.

VEAL CALVES.—Supplies have been moderate and extra selected milk fed have made 7c; wholesale lots at yards and West Washington market; quoted:

Live calves, N.J. and Bucks Co., choice, 6@6¾c., State fair to choice, 5½@6½c.; poor, 4@5c.; Mt. Holly, 5@6½c., 250 lb. down; buttermilk, 3½@4½c.; grass 2c.

SHEEP AND LAMBS.—Receipts for week, 29,947 head; do. last week 27,783do. There has been a fair demand for sheep and a quiet movement for lambs; fair to prime sheep 3½@5½c.; extra wethers 5½c.; lambs ranged $4.25@6.10.

SWINE.—Receipts for the week, 19 027 head; do last week, 23,476 do.; fair to prime live Western, $5.30@5 65 ₱ 100; a few state $5.60 do.; city dressed heavy to pigs 6⅞@7¼c.

DAY'S KIDNEY PAD
A CURE for the most prevalent and fatal diseases that afflict mankind FOUND AT LAST. Internal medicines never did nor never can cure KIDNEY DISEASE. STOP IT NOW; apply Day's Kidney Pad AT ONCE, and be cured of all affections of the Kidneys, Bladder and Urinary Organs. It is the only treatment that will cure NERVOUS AND PHYSICAL DEBILITY, and that distressing complaint, "BACK ACHE." It will annually save many times its cost in medicines and plasters, which at best give but temporary relief. Sold by Druggists or sent by mail on receipt of price, $2. Our book, "How a Life Was Saved," giving a history of this new discovery and a large record of most remarkable cures, sent free. Write for it.
DAY KIDNEY PAD CO., Toledo, O.

Our BONE MANURES stand without a rival for Wheat and Grass. Every Bag guaranteed. They are dry, and drill with regularity. ☞ *Send for Circulars.*

Reading for the Young.

GREETING TO THE ROBIN.

GOOD MORNING, little robin!
I heard you sweetly sing,
Before I rose this morning—
You're early on the wing.

Oh say, where are you going,
With straws held in your beak?
I know a nest you're building,
I wish that you could speak.

I'd like to get acquainted,
Sweet robin now with you.
But robin would not listen,
And quick away she flew.

—SOPHIA C. GARRETT.

THE HERMIT THRUSH.

AWAY in the quiet country places, when the farmer boy's chores are done, and he has bathed his rosy face and brushed his hair at the little glass by the kitchen window, and with his straw hat for a fan, sits on the broad stone step through the short hours of twilight, from the forest away on the hillside comes to him the clear song of our American nightingale, the Hermit Thrush (called by Nuttall Turdus Solitarius). Could I only give you a few measures from its warbling song, you would instantly recognize my little favorite, for it is an inhabitant of every part of the United States, and as good authority as Nuttall says its song is scarcely less beautiful than that of its English cousin, the nightingale.

Just as the sun is setting, seat youself near some shady grove or forest, and you will be sure to hear the most wierd, witching of all bird songs. But he is a very shy, quiet fellow, and one seldom sees him unless carefully on the lookout. I have heard his song ringing from hill to hill away in the depths of mountain forests, but could never find the minstrel, until walking one day in Central Park, a friend pointed him out to me as he walked quietly about intent on his own dinner.

From its solitary habits this bird has been given the name of Hermit Thrush, never going in companies, but walking its quiet ways alone.

The thrush is about the size of the common robin, though rather more slim, and of the form of the cat-bird, all three belonging to the same family, and of similar characteristics. Color above, plain, deep olive-brown; upper part of the breast and throat, cream color; the dusky brown penciliated spots carried over the breast and under the wings, where the sides are pale olive; tail short and emarginate; short, black bill, and black, wise eyes, that give you an honest, inquiring look, and then seem to forget your presence altogether.

The thrush, like the cat-bird, builds her nest in trees or shrubs near the ground. It is composed of dry grasses, sticks, and leaves, but is rather more compactly built, and is neatly lined with fine grasses, in which we find from four to six light-blue eggs, sprinkled with blotches toward the larger end, and very like the robin's eggs, that almost every boy and girl has peeped over into Sir Robin's mud house and counted over and over again, until some day four little yellow mouths were opened, and the blue eggs had disappeared.

I don't think I will tell you what the thrush eats for his dinner, only that his dessert consists of berries and cherries with the ripest hearts, or grapes of the softest purple. He is a dainty fellow when he comes to consider dessert, and does not fancy half-ripe fruits. Perhaps, being a singer, he fears to injure the tone of his sweet, clear voice.

MAUDE MEREDITH.

MESSINA QUAIL.

THE Messina Quail, a new bird to America is being imported by Sportsmen and turned loose in several localities. The following is a description of it:

"In size it is about one-half as large as the European partridge (Perdix cinerea) and three-fifths as large as our "quail"—partridge—(Orlyx virginianus:) is very compactly built, with great speed in running and a powerful and long-continued flight, enabling it to cross large bodies of water in its migration. The bill is longer and more slender than is our Ortyx virginianus. The color is brown, striped with reddish-yellow on the upper parts of the body; the head is darker than the back, the throat reddish-brown, and the region of the crop reddish-yellow. A pale yellowish line passes from the base of the upper mandible over the eye and down the sides of the neck across the throat, where it is banded by two narrow dark-brown lines. The blackish-brown primary quills are spotted with reddish-yellow in such a manner as to form stripes. The first quill has also a narrow yellow border. The reddish-yellow tail feathers have white shafts, and are spotted with black at their edges. The length is 7½ inches, and expanse of wing 13 inches. The tail is 1¾ inches long. This is the male. In the female all these colors are comparatively indistinct. The bird is very hardy. These have been three months in the packing crates, and none have been lost. All seem to be in a vigorous condition. As a food bird it is excellent, and in Europe esteemed a great delicacy. It lays well before the dog, and gives fine sport for the sportsman, and he who kills them on the wing must be quick and true. The species is very prolific, and, under favorable conditions, it is expected they will become one of the bird features of this locality. The nest is made on the ground, like the partridge, and fourteen or fifteen white eggs are deposited.

ROSE CUTTINGS.

THOSE of our young readers who wish to increase heir stock of roses can do so by transplanting the suckers when the rose is on its own stock, but if not, or the suckers are not abundant, the simplest plan is to propagate by cuttings. The cuttings should be taken in Autumn and should be about six inches long and of the season's growth. The lower end should be cut square close to a bud and set thickly together, two-thirds their length in sand in a light, dry cellar during the Winter.

They should be planted out as early as practicable in the Spring in a light, sandy loam, with one bud and one-third the length of the cutting above ground. The earth should be packed closely about them, and if the weather is dry they should be carefully watered in the evening.

For the more delicate varieties the cuttings should be placed in pots in a cellar, and early in Spring the pots should be placed in a house with a moderate temperature and sprinkled every morning with tepid water and shaded from the sun until rooted.

THE BABY PLANT.

A PORTLAND, Oregon, paper says that one of the strangest and most interesting flowering plants ever brought to this country is on exhibition at Mr. Shanahan's Madison street store. It is said to be indigenous to Japan. Its technical term has not been ascertained, but it is known, and appropriately so, as the "Baby Plant." It is of the genus lilly, somethimes attaining a hight of four feet, and blossoms semi-annually. The one of which we write is, however, not more than twelve inches in hight, with leaves about six inches long and two inches wide. The flower is star-shaped, having five petals of a handsome brown and yellow color. The calyx encircles and protects a tiny little figure that bears an exact resemblance to a nude baby, its little arms and legs outstretched, and the eyes distinctly marked. Hovering over this diminutive form is a small canopy, angel-shaped, having extended wings and peering closely into the face of the infant. The plant was examined by large crowds yesterday and people who have a penchant for floriculture will find this an interesting study.

[Our correspondent has our thanks for sending us this item. U. M.]

AN EAGLE THAT RIDES DOGS.

SOME three months ago, while hunting in the mountains east of Twelve-Mile House, Mr. Buffington of San Jose, Cal., captured a young American eagle when it was but a few weeks old. He has his pet confined in the back yard of his shop, and the many and curious monkey shines indulged in by the mountain bird are amusing. Measuring now some eight feet from tip to tip and weighing 40 pounds, with talons three inches in length, there is but small chance for any dogs in the neighborhood. For as sure as the dog makes his appearance the eagle spreads his wings, and, with a loud scream, lights on the back of the terror-stricken animal. The dog, without further notice, darts through the side-gate and into the street, with the eagle attached to his back. Down street he goes at a break-neck speed. At a distance of about two blocks the eagle bids the dog an affectionate adieu and quietly returns as though nothing had happened. The same experiment is gone through with whenever the dog appears. It does not seem necessary to remark that dogs of any description are seldom seen in that part of the town, and the same dog seldom more than once. It would be a blessing to our city if we had one such bird on each block. It would save our pound-master much unnecessary trouble.

A TAME PARTRIDGE.

IT has generally been supposed that partridges could not, or not easily be tamed, but a correspondent reports that: "Visitors to Coldbrook Springs in Massachusetts are shown a curiosity, about one mile from the hotel, in the shape of a tame partridge. A young man escorts the guests to a little opening where some lumber has been piled. Taking a stick he raps upon the boards; once, twice, several times he emphatically disturbs the stillness of the adjacent woods. In response a fine fat partridge walks forth from the underbrush. The guide feeds him with berries, catches him, caresses him, and then allows him to follow for a short distance. This, indeed, is a rare bird. He has kept thus familiar with man for two years. Caught at first when young by a slip-noose, and somewhat familiarized with human beings, he now holds his home in the woods and loves to come out when the teams are at work, lighting now on the horses and then on the wagons."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I will write and tell you of my successes and failures in growing the seeds you so kindly sent me, for which I thank you. None of the portulacca seed germinated, and this is the only total failure, although the phlox were a partial one. I have five little plants which are just beginning to blossom, though they were sown early in the Spring. I think the reason of their being so late was leaving them so long in the seed bed, for as soon as they were transplanted to the open ground they grew rapidly.

The mignonette was sown in the open ground and grows and blossoms luxuriantly. The China Pinks were sown in a box and placed in a sunny window until they were large enough to transplant to the flower bed, where they are growing nicely and are full of buds and blossoms, which are of rich colors and velvety appearance.

The melons are doing nicely, and I hope soon to test their quality. From the six okra seeds I have five flourishing plants which have an abundance of seed pods. We cooked some, but none of the family seem to like them. Will some of the cousins or Emily Maple please give their receipt for cooking okra?

The double hollyhocks sent by the RURAL last year are doing nicely. The flowers are pure white and very pretty. We have 30 different varieties of flowers this Summer. Among those which are doing the best are gerantums, Perennial Cypress, mignonette, pansies, portulacas, petunias, pinks, etc. At what time should cuttings of roses be planted? Again, thanking you for the seeds, I am yours truly. NELL.

Niagara Co.

[We give recipe for okra soup in household column. See also article on rose cuttings below.—U. M.]

DEAR UNCLE MARK: The seeds you sent me have given me much pleasure. My muskmelons are doing nicely. I have four plants of okra. The pods are getting quite large. I have not picked any of them, as I wished them for seed for another year. I have a bed of peanuts growing; also a raddish bed. My pinks are very handsome. The coxcomb is growing very thrifty, but has no blossoms on it yet. Phlox, mignonette, portulaca and gladiolus are in full bloom. I take all the care of my flowers and vegetables out of school hours, and I would be pleased to have you see them. I will close with my best wishes to you.

Lewis Co., N. Y. FREDDIE H. LOUDES.

DEAR UNCLE MARK:—I am a boy 13 years of age. I never wrote to you before. Pa takes the RURAL and I like it real well. I can hardly wait from one mail till another till it comes. I would like to join the Horticultural Club. We have a great many flowers this year; we have Dahlias, Dianthus, Double red pink, Spotted Balsams, Gladiolus, Portulucas, Asters, both dwarf and tall, Pansies and many other varieties. It takes some labor to grow flowers, but they pay it back in their beauty. I would like to exchange Aster seed for Verbena seed, or dwarf Dahlia bulbs, next Fall. Your affectionate nephew, ROBERT PERRY.

Dunn Co., Wis.

DEAR UNCLE MARK:—I am a little girl five years old. I like to read the cousins' letters very well. I want to join the Horticultural Club. We have a great many flowers this Summer. I help mamma to weed them. I love Balsams and Dianthus and Dahlias best. Your little niece, GERTIE PERRY.

Dunn Co., Wis.

[The youngest member of our club.] U. M.

The Puzzler.

LITERARY ENIGMA.—(53 letters.)

Wreck of the fallen world, 8, 18, 43, 23, 33, 4.

So twilight deepened round us, 1, 39, 13, 30. 21, 19, 3, 52.

Ah, 'twere a lot too blest forever in thy colored shades to stray, 36, 4, 53, 6, 27, 38.

For as the whole round earth is every way bound by gold chains about the feet of God, 8, 15, 11, 35, 37, 28, 22, 20.

I come, I come, ye have called me long, 2, 5, 16, 25, 51, 20.

Christian faith is like a cathedral with divinely pictured windows, 2, 26, 49, 8, 2, 33, 4, 27, 47.

The organ heaved its surges to and fro, 12, 33, 34, 50, 12, 12.

To gaze in eyes that here were lovelit only, 31, 30, 40, 46, 10, 42, 11.

It is so sweet to live my little life to-day, 14, 29, 10, 36, 48, 12, 12.

The night has a thousand eyes, 36, 22, 9, 4, 32, 19, 12, 12, 33, 11.

Blessed are they also who expect nothing for they shall not be disappointed, 28, 41, 45, 17, 30.

None but the brave deserve the fair, 24, 4, 43, 24, 3, 11.

The whole is a selection from Longfellow.

THE LOOM OF LIFE.

ALL day, all night, I can hear the jar,
Of the loom of life, and near and far
It thrills with its deep and muffled sound,
As tireless the wheels go always round.

Busily, ceaselessly goes the loom,
In the light of day and the midnight's gloom:
And the wheels are turning early and late,
And the woof is wound in the warp of fate.

Click, click!—there's a thread of love woven in;
Click, click!—another of wrong and sin;
What a checkered thing this life will be
When we see it unrolled in eternity!

When shall this wonderful web be done?
In a thousand years, perhaps, or one,
Or to-morrow! Who knoweth? Not you nor I;
But the wheels turn on and the shuttles fly.

Ah, sad-eyed weavers, the years are slow,
But each one is nearer the end, I know;
And soon the last thread shall be woven in—
God grant it be love instead of sin.

Are we spinners of good in this life-web—say?
Do we furnish the weaver a thread each day?
It were better then, O, my friends, to spin
A beautiful thread than a thread of sin.

PRAYER.

"To say my prayers is not to pray
Unless I mean the words I say;
Unless I think to whom I speak,
And with my heart His favor seek.

"In prayer we speak to God above,
We seek the blessed Saviour's love;
We ask for pardon for our sin,
And grace to keep us pure within.

"But oh, if I am found to smile,
Or play, or look about awhile,
Or think vain thoughts, the Lord will see,
And how can he be pleased with me?

"Then, let me, when I try to pray,
Not only mind the words I say,
But let me strive, with earnest care,
To have my heart go with my prayer."

CONSCIENCE.

CONSCIENCE is sometimes regarded and spoken of as a separate and distinct principle in the mind, placed there to warn us when we do wrong, and to approve what is right. Hence it is called God's vicegerent, an inward monitor, and various other names expressing its use and its claims. This view of conscience, it must be remembered, is only a figure of speech, neither telling us what conscience really is, nor how it operates, nor giving help to enable us to employ those means which may enable conscience to act most correctly and usefully.

The truth is that conscience is not a distinct principle, or something separate from the mind, but is nothing more than the mind or understanding itself acting in a particular manner, just as judgment is really the mind judging, memory is the mind remembering, perception is the mind perceiving. So conscience is really the mind acting in a particular manner, passing judgment on the actions or affections of the individual himself, according to some received standard of right and wrong; and to the mind so in action the name of conscience is applied.

Another mistaken option about conscience, it is necessary to notice. Sometimes it is spoken of as a law of action, itself pointing out what is right as distinguished from that which is wrong. But conscience is not a law. It is more like a judge. And as a judge does not make law, but only declares or expounds what is law, so does conscience, having already an outward standard of right and wrong to go by, compare a man's own action with it, and pronounce a decision of right or wrong, according to their agreement with or contrariety to the same.

Now the importance of these corrections or cautions will be evident. Every one is prone to plead conscience when wishing to defend some line of conduct. But this plea is valid only when conscience is really brought into exercise, and when the standard by which conscience makes its judgment is on the side of truth, justice and right.

OUT OF THE GARDEN.—There is a beautiful garden in which God places every child that crosses the boundaries of life and enters this world. It is the Garden of Innocence. It is like the Eden of Adam and Eve. A tree of the knowledge of good and evil is in it. The fruit of the tree of life grows there. Satan has found his way into it, too. No angel is there to drive the child out. God does not forbid it there. But there is one door out of this garden. It is the door of sin. And out from this garden of innocence, through this door of sin, into the realm of guilt, the children are passing, one by one. They find this door without guidance; for it is wide, and always open. They cross its threshold without compulsion. What a mercy it is that the canopy of Christ's atonement hangs over all this outer realm of guilt into which our dear children are straying with heedless feet! What a joy it is that on the thorniest road and in the darkest ravine the Good Shepard is going to and fro, "to seek and to save that which was lost!—Evangelical Messenger.

DEATH is not the cruel monster that we deem him. He is one of God's brightest angels, sent from heaven to bring home some loved one of earth. So bright are his robes that their glare would blind us were they not covered with a sable mantle.

WE should act with as much energy as those who expect every thing from themselves, and we should pray with as much earnestness as those who expect every thing from God.

PERSONAL ITEMS.

Among the recent arrivals at Chicago is a son of General Sheridan——a new one.

Dr. T. De Witt Talmage tells the Salt Lake Tribune that "guns alone can uproot the vile weed Mormonism."

Ex-Minister Robert C. Schenck is reported to be dangerously ill in Vermont with Bright's disease. He is seventy-one years old.

Senator Bruce, of Mississippi, is reported to be the possessor of two large plantations in his State, and has a fortune also of $200,000.

President Hayes is receiving many invitations from agricultural fair associations, and his secretary says that he is seriously inclined to accept all of them.

At McKinney, Texas, a colored woman named Sukey Hunt, reported to be 140 years old, was buried Sunday. She was the mother of nineteen children She was sensible to the last.

August Denu was sentenced to six months' imprisonment in Baltimore for drunkenness, on the complaint of his mother. Before his term was over she died and left him by will $10,000.

Senator Conkling has been a hard man to secure at agricultural fairs in his own State, but he has just accepted an invitation to appear with Gen. Grant at the Wisconsin State fair in September.

Jenny Lind, who left the stage in 1860, is still hale and hearty. As Madame Otto Goldsmith she is a worthy-looking and somewhat stout lady, with white hair. She will be 58 years old in October.

Two daughters of Gen Banks will soon cross the Atlantic—one as the bride of a young clergyman, who goes to a mission in China, while the other is bound for Paris, where she will study for the stage.

The Earl of Hardwicke, Master of the Buckhounds under the Beaconsfield Administration, is bankrupt. Last month even his deer and pheasants were sold at his seat, Wimpole, Cambridgeshire, 200 head of the former bringing 200 guineas.

Ex-Gov. Herschell V. Johnson of Georgia, died a week ago, having been U. S. Senator, Governor of Ga., candidate for the vice-presidency on the Douglas ticket, an opposer of Secession at first and afterwards a supporter of it, a Confederate Senator and a judge on the State bench.

Hancock, Hooker and Burnside are said to have been the handsomest men on horseback who fought on the Federal side in Virginia. McClellan rode too large a horse. Custer and Farnsworth were splendid horsemen. Grant rode well, but was not graceful. Meade was not a good rider.

Daniel O'Neil was arrested in Chicago on a charge of murder. He was not considered guilty, and had good reason to expect a speedy release; but his reason gave way under the excitement, and he constantly imagines that he hears the hammers on the scaffold which is being erected for his hanging.

"Dr." John Buchanan of Philadelphia, the bogus medical diploma dispenser, who was indicted for fraud and using the mails for illegitimate purposes, has drowned himself. Some suppose that in this too he is a fraud; and that he got some good swimmer to personate him in jumping from a ferry boat on the Delaware between Philadelphia and Camden.

It was so common for Freeman to whip his wife at Memphis, that the neighbors paid little attention to the bruises which she constantly bore. She never complained of them and was seemingly resigned. But a few day ago a pistol shot was heard in her house, and her husband was found with a bullet in his head. "I concluded that I'd stood it long enough," she said, "and, Lordy sakes; wasn't he surprised when I hauled out my pistol and popped at him;"

Lilian Adelaide Neilson, the celebrated actress who died suddenly in Paris, was about 35 years old. She was originally a bar-maid in England, attracted the marked attention of a wealthy gentleman who paid for her education for the stage. There's a flattering account of her birth in Spain, put out after she became well known, but really where she was born and her exact age are not known. She is supposed to have died worth half a million of dollars, for which there will, most likely, be a bitter legal wrangle between her first husband, Mr. Lee, and her last one, Mr. Compton, as the English laws will hardly recognize the divorce she got from the former in this city.

What a Clergyman Says About the Vitalizing Power of Compound Oxygen.

A clergyman, Rev. W. P. Illnes of Waynesboro, Miss., writing to the New Orleans Christian Advocate, says, referring to an advertisement of Compound Oxygen in that paper: "Please allow me a few words of commendation. My wife being in feeble health, and having been so for many years, I persuaded her to use it, which she did. She began very soon to improve in strength and continued to improve, and passed through the unusually hot summer of 1878 and the fall, attending to all her domestic duties with more strength and less fatigue than she had done for ten years preceding; then during the winter nursed the sick day and night, with more than usual loss of sleep and exposure and effort, and all without breaking down, *which she could not have done at any period during ten years past up to that time.* In order to have some experimental knowledge of the effect of this Treatment, I used it several times myself. In all my life I never used anything that produced such a pleasant, healthful naturalness of condition. Gave a glow of youthful buoyancy by increasing the vital forces of mind and body. *It gave a compass and power to my voice that it never had before.*" Drs. Starkey & Palen, of Nos. 1109 and 1111 Girard Street, Philadelphia, Pa., send their Treatise on Compound Oxygen free to all who write for it.

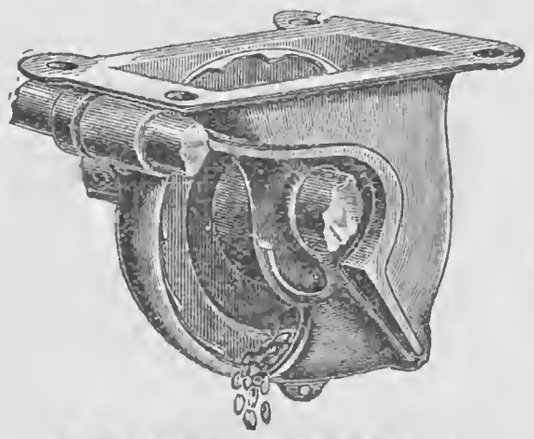
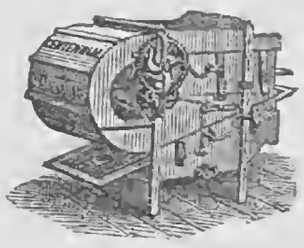
All work is fully warranted in every respect.
A finely Illustrated and Descriptive Catalogue and Price List furnished free upon application. Address
CORTLAND WAGON CO.,
Cortland, N. Y.
Or 263 & 265 Wabash Avenue, Chicago, Ill.

The New Buckeye



GRAIN DRILL,
ALSO
THE NEW BUCKEYE
Combined Grain and Fertilizer
DRILL,
AS IMPROVED FOR 1880.
Over 7,000 of these new Drills were sold and used in the United States last season, and were pronounced by all to be the *most perfect Seeding Machines* in the country. No Grain Drill ever made gave such *universal satisfaction.* It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal in this country. Be sure and send for our new Illustrated circular, giving illustrations and descriptions of the improvements. Address
P. P. MAST & CO.,
Springfield, Ohio.

The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers. Address, S. FREEMAN & SON,
Racine, Wis.

The Monitor Jr. is the most perfect Clover Thresher, Separator, Huller and Cleaner in the world. The Threshing and Hulling Cylinders run under-shot. They also continue to manufacture the old "Monitor," with *Threshing* and *Hulling* Cylinders running *over-shot.* Send for price list, terms, and descriptive catalogue. Address as above, and say you saw this in the Rural New-Yorker.

The request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high standing and trustworthiness.

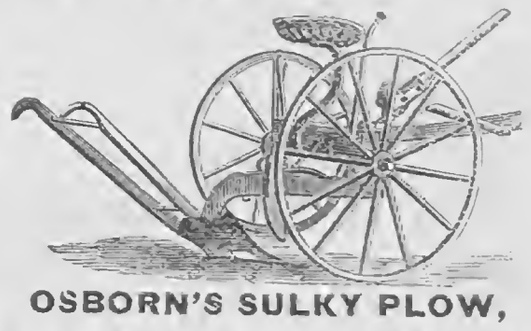
LATEST IMPROVED
HORSE-POWERS.

FOR ONE, TWO AND THREE HORSES.
MACHINES FOR
Threshing and Cleaning Grain
AND SAWING WOOD.
Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

☞ Will produce more income than many farms do.
Do not fail to Send for Illustrated Circular Before Buying.
☞ Every Machine guaranteed as represented.
☞ Circulars free. Address as above.

$1000 REWARD
FOR ANY WASHING MACHINE that will wash cleaner, quicker, with less labor and wear and tear of clothes than the ROBBINS FAMILY WASHER AND BLEACHER, patented Oct. 3, 1871. No rubbing required. It is the best in the world, and cannot get out of order. GOOD AGENTS WANTED, BOTH MALE AND FEMALE. Send for descriptive circulars and testimonials. Price $3.50 delivered at Railway Express Office east of the Mississippi and Missouri Rivers, also in Kansas and Nebraska.
BISSELL MANUFACTURING CO.,
50 Barclay St., New York.

SULKY PLOWS.—THE SUBSCRIBERS Are the only manufacturers of



OSBORN'S SULKY PLOW,
the only Plowing Machine that has proved a perfect success in all kinds of soil. Any kind of plow can be attached. The plowman rides and handles the plow with ease, regulating the depth and width of furrow. The draft for the team is materially less, and the ordinary laborious mode of plowing is reduced to one of comfort and ease. Sulky made for both right and left hand plows. Also, manufacturers of
THE MEADOW KING MOWER,
and other Agricultural Implements.
☞ Send for circulars.

THE FERGUSON BUREAU CREAMERY.
Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequaled keeping quality. It excludes flies, dust and odors; is constantly at the correct temperature (55° to 60°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter.
THE FERGUSON CONCUSSION CHURN is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Before buying any other Churn or Creamer; or any pans, or cans, send for large illustrated circular to THE FERGUSON MF'G CO., Burlington, Vt. Reliable Agents Wanted.

Humorous.

"ONLY twenty?" "Yes," she explained. "George made me promise when we were married that I would never change. I was twenty then, and I mean to keep my promise."

A LADY who had quarreled with her bald-headed lover, said, in dismissing him, "What is delightful about you my friend, is that I have not the trouble of sending you back any locks of hair."

A SCHOOL mistress, while taking down the names and ages of her pupils, and of their parents, at the beginning of the term, asked one little fellow, "What's your father's name?" "Oh, you needn't take down his name, he's too old to go to school to a woman" was the innocent reply.

A LITTLE Oil City girl observed her mother measuring cloth by holding it up to her nose with one hand and reaching out to arm's length with the other. She assumed a thoughtful aspect, and after cogitating a moment, asked: "How can you measure cloth that way? Can you smell a yard?"

"YES; I am to be married, my dear friend. The young lady is pretty and very clever, yet she cannot play the piano-forte, that is her only failing." "Why, I should call that a blessing. It is certainly no fault!" "Hear me through. She cannot play the piano-forte and yet she always insists on playing."

"How did you like the new minister?" asked a lady of a little girl, when she returned from church—"O, he is splendid! I like him ever so much better than I did Mr. Edwards."—"Why?" asked her mother, amused at the little one's earnestness.—"Well," said the child, trying to think of a good reason, "he has a better complexion!"

LEVER, the novelist, noticing that the hand of a woman who was bringing him some tea at a small country hotel shook tremulously, kindly said to her: "I am sorry to see, Biddy, that you have a weakness in your hand." "Oh, your honor," she replied, with a glance of indescribable humor, "the weakness is not in me hand, but inside the tay-pot."

"WHEN I was once in danger from a tiger," said an old East India veteran, "I tried sitting down and staring at him, as I had no weapons." "How did it work?" asked a bystander. "Perfectly; the tiger didn't even offer to touch me." "Strange! How did you account for it?" "Well, sometimes I've thought it was because I sat down on a high branch of a very tall tree."

"THIS is a nice time of night for you to be coming in," said a mother to her daughter, who returned from a walk at 10 o'clock. "When I was like you," continued she, "my mother would not allow me out later than 7 o'clock." "Oh, you had a nice kind of a mother," murmured the girl. "I had, you saucy girl," said the mother, "a nicer mother than ever you had."

New Strength

Is infused into a debilitated system by the sovereign vitalizer and tonic, Hostetter's Stomach Bitters. Digestion and assimilation, functions, the interruption or feeble performance of which materially impair vitality, are regulated and encouraged by the Bitters, and the mental despondency which usually affects the dyspeptic and nervous invalids, gives place to cheerfulness when this genial invigorant and corrective is used. It enables the stomach to perform its duties, insures complete nutrition and banishes every symptom of dyspepsia. The restoration of a regular habit of body is another and more important result of taking it. It quiets as well as invigorates the nervous system, promotes appetite and sound repose, and may be relied upon for purity as well as effectiveness. Moreover it has no peer as a remedy for, and preventive of fever and ague and bilious remittents.

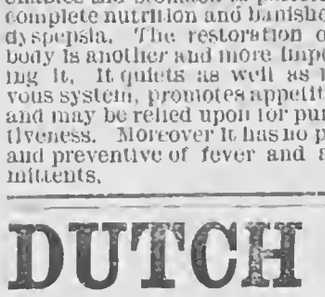
DUTCH BULBOUS ROOTS.

Descriptive Priced Calalogues of our new importations now read for mailing to applicants.

J. M. THORBURN & CO.,
15 John Street, New York.

AMERICUS CIDER MILL.

WHITMAN'S PATENT.



The best Cider and Wine Mill made. It will make Twenty per cent. more Cider than any other.

Perfectly Adjustable.

Three Sizes.

Geared outside. Large Mills made for two cranks.

Prices as low as any first-class mills.

Circulars giving full description sent free. Address the manufacturers.

WHITMAN AGRICULTURAL CO.,
Saint Louis, Mo.

"NASTY LITTLE THING."

Elder Sister (tired):—"Do let's turn back, we are so far from home; thunderstorms are so frequent, too; and you know how frightened I am of lightning."

Younger ditto (not tired); wants to go further):—"Come on, it's fine enough now; you needn't be frightened of lightning, it won't touch you. You're not particularly attractive."

The Literary Revolution.

What Is It? It is a method of placing literature, of the best class only, within reach of every one. Books are reduced in price to but a fraction of their cost heretofore. July is supposed to be the Dull Month of the year, Booksellers close shop and go fishing, because book buyers are supposed to have done likewise. The Literary Revolution has made the past July one of the busiest months of the year for dealers handling our books, because the people believe in it. Letters have come to us like a flood; telegrams from dealers have come like the day before Christmas, calling for more books, and quickly. Our bindery is now taxed for the production of 4000 volumes a day, not counting pamphlets, and we are taking immediate steps to double its capacity, to keep up with orders. All Revolutions seek volunteers, and it has been the policy of The Literary Revolution from the start to give special reward to early volunteers in its support. It offers special terms to all whose orders, with cash, are received during August, as follows:

July Victories.

August Opportunities.

Chambers's Encyclopædia.

A verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth for $7.50; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price $15.00. The first eleven volumes are ready for delivery. Volume 12 will be ready Aug. 15. The remaining volumes will be completed by October.

AN AMAZING OFFER.

To all whose orders and money are received during the month of August, we will supply the 15 volumes, in cloth, for $6.50, and in half Russia, gilt top, for $13.00. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, postpaid, for 50 cents, or in half Russia, gilt top, for $1.00, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Curiosities. To illustrate and demonstrate the superior literary and typographical character of our books, notwithstanding prices are low beyond comparison with the cheapest books ever before published, we publish twelve books in pamphlet form and send postpaid as follows. As mere curiosities they are worth obtaining by every one, even if they were not intrinsically valuable. As might be expected, they are selling by the million. All the following are unabridged, and none of them are in type smaller than brevier. Nearly all of them have heretofore been published by other houses at from $1.00 to $1.25 each. Macaulay's "Life of Frederick the Great," Carlyle's "Life of Robert Burns," Thos. Hughes' "Manliness of Christ," John Stuart Mills' "Chapters on Socialism," Mary Queen of Scot's Life, by Lamartine; "Leaves from the Diary of an Old Lawyer"—short, thrilling, laughable, pathetic stories—each complete, price three cents. "The Light of Asia," by Edwin Arnold; "Baron Munchausen's Travels and Surprising Adventures;" "Vicar of Wakefield," by Oliver Goldsmith; "Stories and Ballads for Young Folk," illustrated, by Ellen Tracy Alden, each five cents. Closing the list is Bunyan's "Pilgrim's Progress," price six cents; and "Private Theatricals" (humorous stories, not plays), by author of "Sparrowgrass Papers," price, two cents.

Books, 3 Cents.

Books, 5 Cents.

6 Cents—2 Cents.

Notwithstanding the amazingly low prices of these pamphlets, they pay us a good profit. The Literary Revolution does not humbug people by pretense of philanthropy. People who have sense enough to appreciate good books are generally honest enough to be willing to pay for them, and they can afford to pay when prices are low as the Revolution makes them. In this connection it is proper to mention a few facts.

Stop Thief! Some millionaire publishers have been adding to our fame and multiplying our friends by calling us pirates. They pay (when they please!) foreign authors a copyright. One of them charged you $1.00 for Hughes' "Manliness of Christ"—we sell it to you for 3 cents. How much of the 97 cents difference did Hughes get, do you think? Another published Geikie's "Life of Christ" for $3.00—our price is 50 cents. How much did Dr. Geikie get of the $2.50 difference? His letter to us says "nothing." Scribner's Monthly attacked us recently, calling us Cheap John Publishers. The same electrotypers and printers that do their work are working also for us, and you want no books more beautiful than are some of ours. The great Methodist Book Concern has refused us space even in the advertising columns of its several Christian Advocates. Why? Our books are so cheap they contrast with and injure the sale of theirs. We reduced Smith's "Bible Dictionary" from $3.00 to 50 cents; Kitto's "Cyclopædia of Biblical Literature" from $10.00 to $2.00; and Young's "Analytical Concordance to the Bible," "the Webster Unabridged" of religious literature, the greatest work of the kind which the century has produced, from $15.00 to $2.00. The people may pronounce the verdict who is guilty of wrong-doing—we, or the millionaire publishers.

Who Is He?

General Grant. General Grant once said that the best way to get rid of a bad law is to enforce it. If the want of an international copyright is a wrong to foreign authors, American publishers are to blame that there is none, and could influence the passing of such a law quickly if they chose to do so. We believe that the author of a book is as much entitled to absolute property in it the world over as is the author of any other product of the hand or brain. We vote for a law to give him such ownership, and The Literary Revolution more than all other influences is forcing the consent of millionaire publishers to the passing of such a law. But there is plenty of humbug in the talk of high prices being the necessary result of copyright. Five cents copyright on a book would give an author $5,000 on a book that would sell 100,000 copies; and a book intended for the masses that will not sell 100,000 if put at a reasonable price does not deserve to be published at all. And the really standard books that the masses want ought to sell and will sell a million copies each easily when The Literary Revolution has achieved its final victories and made the masses readers of good books. And a million books, paying copyright of even one cent each would give an author $10,000, which is more than ten times what the average successful author now gets. But Bunyan, Goldsmith, Milton and Virgil are no longer wanting copyright, and Macaulay, Carlyle, Gibbon, De Foe, Plutarch and Æsop ceased to receive it long before the days of The Literary Revolution. We do pay five to fifteen cents copyright on several of our books to American authors who have the right to it, and we are paying regular salaries, many thousand dollars a year, to writers in our service.

Standard Books.

Library of Universal Knowledge, 21 vols., $10.50.

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 36. WHOLE No. 1597. | NEW YORK, SEPT. 4, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

MUSHROOM CULTURE IN THE CAVES AT PARIS.

BUT little progress has yet been made in the culture of mushrooms in the United States, the demand being limited, in part from a want of knowledge of the edible value of mushrooms, and in part from their high price. Mushrooms are grown in the vicinity of New York by a few private families and a few market gardeners who supply them direct to the leading hotels, restaurants and club houses, but the greater proportion of those consumed in the United States are imported from France in sealed tins.

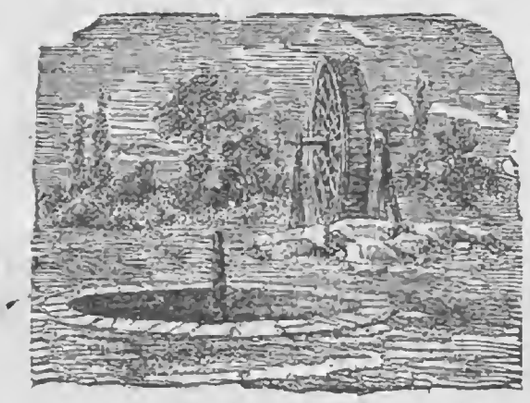
In the cultivation in the United States the first object is to obtain some convenient place of equable temperature, light being unnecessary, where the beds may be placed and the work carried on. In choosing such a place a dry, clean cellar may be used or part of a shed, if in Summer on the north side, if in Winter, where it can be kept warmed, the object being to preserve the temperature and inclose the beds from the sudden changes of temperature. Perhaps the best plan of all is to construct a place under ground as nearly resembling a cave as possible, the moisture and temperature of caves being found to answer the nearest the requirements of their cultivation. In the preparation of the manure great care and study are required that there be not too much or too little heat. When ready, the beds are made in rows some 20 to 24 inches high and wide, and covered with sifted earth. The spawn is then placed in them.

The spawn used in the United States is that obtained at the seed stores, in the shape of bricks. The bricks are broken into pieces the size of hickory nuts, and placed in holes made by a dibble, some six inches apart each way. In three or four weeks the spawn will have covered the bed, and in a few weeks the mushrooms will be large enough to pick, and the beds will last from four to six months. The industry is one in which there is a promising return for the outlay in its development in the United States.

Much the greater part of the mushroom product which goes to supply the markets of the world comes from abandoned portions of the stone and plaster quarries under the suburbs of Paris, and at other places in France. In the department of the Seine alone, in which Paris is situated, are some 3,000 stone quarries, the abandoned parts of which are used by some 350 growers, producing, on an estimate, 25 tons of mushrooms daily, or to the value of $2,000,000 per annum.

The cultivation of the mushroom in these caves, is an interesting example of what may be accomplished where skill and industry are given to the work, although the natural resources for its prosecution are of the most meager character. These caves are from 25 to 150 feet below the surface and are entered through pit holes by climbing down a ladder made by thrusting rounds through a pole fixed upright, as shown in our illustration, fig. 276. Our illustrations we have reproduced from Mr. Robinson's excellent work entitled the 'Parks and Gardens of Paris," published by McMillian & Co., of London, England.

At the bottom of these pits or entrances the passages radiate in different directions to the caves. At convenient points piles of manure and siftings from the *débris* of the stone cuttings are piled and undergo preparation for the beds. When in proper condition, the beds—some 20 inches in depth—are placed in rows all over the bottom of the cave, with just a narrow passage between to facilitate the work of gathering. Figure 277, shows the appearance of one of the most extensive caves, with rows of beds and the dots of mushrooms. New beds are continually in preparation to take the place of the exhausted ones, and the cropping goes on uninterruptedly.

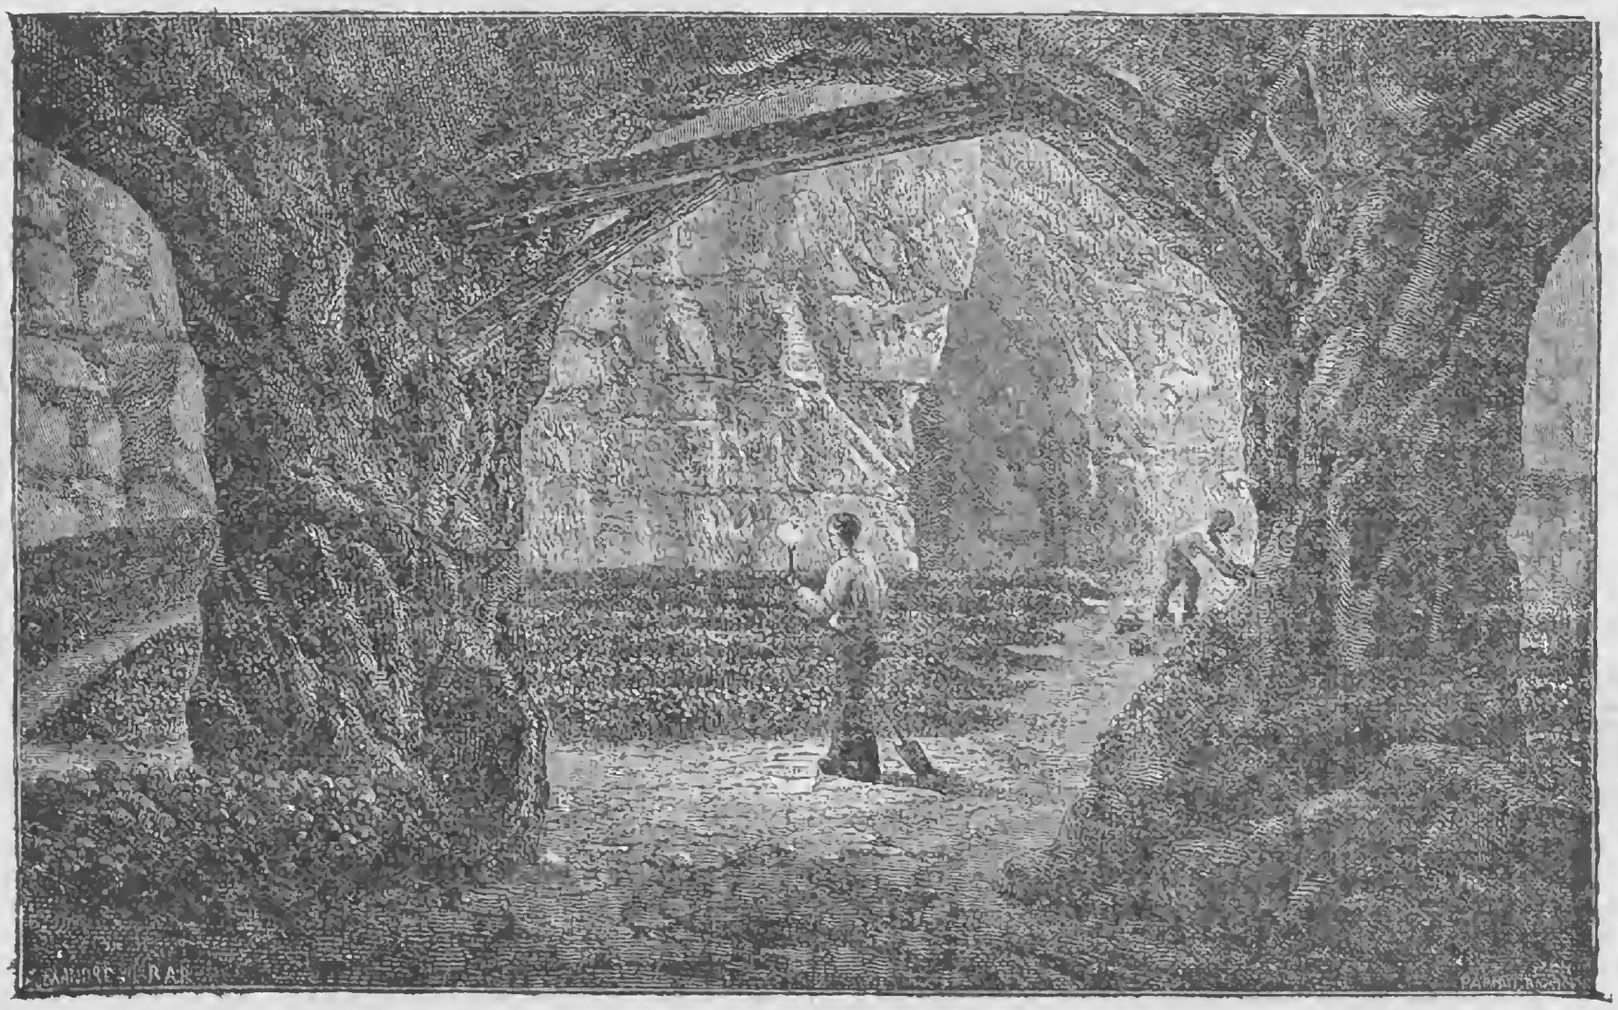


ENTRANCE TO CAVES.—FIG. 276.

The general practice in obtaining spawn is to use so much of an entire fresh bed when it just begins to show the growth, as is necessary each day, which gives a product several days earlier than when the dry dormant spawn is used. The shafts or openings to the surface are made numerous enough to give perfect ventilation both for the health of the mushroom and of the workmen. Strong drafts and sudden changes of temperature are guarded against by trap-doors.

The mushrooms are gathered daily at a very early hour in the morning, when the mushrooms large enough for use are seized and given a slight twist to clear them from contact with any others not fully grown, and removed with the roots entire, the holes being filled with earth. The beds continue to bear from 40 to 60 days, those in the high-roofed caves bearing longest. After some years of continuous use the mushroom grows tired of the cave and a kind of disease called "*La Molle*" makes its appearance, when the cave is entirely cleaned and left a year or two to recover its normal condition. Four kinds of mushrooms are grown: 1, the small white with cap from ¾ inch to 1 5-8 inch in diameter and stem two inches long; 2, the large white three inches in diameter, with short stem; 3, the cream-colored stem two inches long and cap two inches to 2¾ inches in diameter; 4, the gray, the cap sometimes measuring as much as 13 inches in diameter.

The price of mushrooms averages about $12.50 per hundred weight, and they are mostly handled by agents. Large amounts are preserved by drying, desiccating, grating to powder, bottling in oil and in tins. Figure 279 represents the appearance of mushrooms as ready for market.



VIEW IN MUSHROOM CAVES.—Fig. 277.

THE EDIBLE MUSHROOM.—(Agaricus campestris.)

PETER B. MEAD.

IN calling the Agaricus campestris the edible mushroom it is not meant that there are not other edible kinds, for there are several, and some even more esteemed than this by connoisseurs. My object, however, is not to discuss species, but to give a few simple directions for growing the kind almost exclusively known among us as the edible mushroom.

There is supposed to be much mystery associated with the cultivation of the mushroom; but it becomes quite a simple affair when understood. As in everything else, success will be more certain and greater where the proper conditions and materials are at command and properly used. I prefer droppings from horses that are kept chiefly on short feed, but others may be used where these cannot be had. Collect the droppings daily until you have enough for the size of your bed, which may be three or four feet wide and as long as you please. The straw should be shaken out and the droppings kept under cover or in some way protected from rain. Do not put them in a large heap till you get enough for your bed, when they should be well mixed together and put in a heap to ferment. If they should have become quite dry, moisten them very lightly with warm water. The larger the heap the sooner fermentation will begin.

As soon as the heap has become warm (which may be learned by thrusting a stick into it), turn it over with a fork, mixing the parts well together. Repeat the turning every three or four days until the mass becomes homogeneous, or alike all the way through, when it is ready for the bed. The rank heat must be got rid of, which will be in two or three weeks, or even more, according to the weather.

In the Summer and early Fall the bed may be made out-of-doors under a shed or in a hot-bed frame, or in almost any place where it may be protected from rains, if only by a temporary shed or loose boards. In the Winter it may be made in a dry cellar, or under a table in the greenhouse, or even on the table. Determine the size of your bed and then spread the droppings three or four inches thick and beat them down firmly with the fork or spade. Repeat the layers and the beating till the bed is from one and a half to two feet high, and even less will do in experienced hands. The object is to have the bed equally firm throughout. In the open air in the Fall the bed need not be more than twelve or fifteen inches high. Let the bed remain for a couple of days. If the heat is then from 65° to 75°, the bed may be spawned. If more than this you must wait, or reduce the heat by opening holes in the bed.

Be sure that your spawn is good. English and American spawn is usually in bricks, while the French is generally in straw. All are good. Break the spawn into pieces about the size of hickory nuts and insert the pieces from an inch and a half to two inches deep, and five or six inches apart. Next cover the bed with about two inches of good loamy soil, and on the top of this put from six to twelve inches of clean straw or hay. Under a greenhouse table an inch or so of covering will do, or even none at all; and where the hot water pipes are contiguous to the bed I simply make it up of loam and thoroughly decayed manure.

It is usually three or four weeks before the mushrooms appear, and sometimes longer. If the bed should become prematurely dormant, its activity may generally be renewed by the application of pretty warm water through the rose of a watering pot. It should be watered in this way, in fact, as often as it becomes dry, or it will cease to bear. The mushrooms are best in their button state.

It may not be out of place to add that the edible mushroom may be best known by its rose-colored gills. All others, and especially all that have an offensive odor, should be avoided. For the best method of cooking I refer the reader to Emily Maple who has charge of the domestic department of the RURAL. I prefer them stewed. They are used broiled, stewed, in soups, etc.

I have given my own method, but some mix loam with the manure,

and a comparatively recent Freuch practice consists in the liberal use of cow manure and making the beds shallow. Mushrooms may also be grown in pots, but I cannot tell how ust now for I have already exceeded my limits.

MUSHROOMS.

A LATE English writer on gardening, when giving directions for the cultivation of this vegetable, prefaces them with these remarks: "The nature of the mushroom is like that of all fungi, viz., more or less good and pure in proportion to the nature of the soil in which it grows; thus, the pure Agaricus campestris (pure mushroom) becomes poisonous when grown near hedgerows, rotten wood, etc.; therefore every precaution should be taken, both in preparing the spawn and also the material used for the beds."

This is a point which I have never met with before, and if the statement is correct, it may explain some of the mysterious cases of poisoning from eating mushrooms, which we occasionally hear of, but which are generally attributed to the admixture of some poisonous fungi. Really poisonous fungi are not likely, however, to lose their deleterious qualities by cultivation. There is nothing improbable in wholesome fungi being made injurious by the soil or situation in which they are grown, as we have analogous cases in other vegetables; celery and the parsnip, for instance, which are very unwholesome, if not poisonous, in their wild state, especially when growing in wet places. JAMES HOGG.

RURALISMS.

THERE is nothing in bloom in the hardy herbaceous border just now (August 20) that surpasses the white Day Lily (Funkia subcordata or Japonica). It has been in bloom a couple of weeks, and will continue several more. Its pure white, bell-shaped flowers, filling the air with their delicious fragrance, win the praise of all who see them. Besides, the plant itself is a beautiful object and would deserve a place in the garden if it never bore a flower. It is an example of rare beauty of form combined with purity of color and grateful fragrance. If you would see it in its best estate, do not divide it, but let it increase and spread in its own way. It is a lovely plant for the cemetery, needing but little or no care when once established.

A CLERICAL friend very kindly sent me a box of new kinds of strawberries for trial. The last thing I took out of the box, strangely enough, was a bundle of *Shirts*. My own certainly are not so good as when they were new, and I ought to feel thankful for the considerate thoughtfulness of my friend. On looking at the things closely, however, I was struck with their striking resemblance to strawberry plants. Thinking my sight might be somewhat at fault, I concluded to put them in the ground to see what they would come to. So we are to grow shirts in the garden hereafter. Well, let us hope that if they do not prove to be appropriate for the back, they will at least be juice-dishes for the mouth.

POOR Mr. Bailey!

IN nearly all our seed catalogues I see "French Lawn Seed," "Central Park Lawn Seed," or some other park lawn seed. I should be exceedingly pleased if the proprietors of these catalogues would change all this, and give us some American lawn seed. They can do it with the utmost propriety, and with great advantage to their customers. We have a native grass, naturally enough, which, for lawn purposes, is worth all the foreign grasses together. I know what I am talking about. I have made hundreds of acres of lawn, and long ago discovered that the Kentucky Blue Grass (Poa pratensis) is the grass *par excellence* for American lawns. You may sow what you please, but in a few years you will have this grass, and not much else. It is better, therefore, to have it from the beginning. With perhaps the exception of Timothy, it is, for the dairy farm not less than the lawn, the most valuable grass we have, and in particular it gives to butter its chief beauty and excellence. Now, will you not give us some American lawn seed? You may add to it, if you please, the Rhode Island Bent Grass (Agrostis canina) and a trifle of white clover. It looks so absurd to go abroad for something while we have much better at home.

AN objection has been made to that fine shrub, the Hydrangea paniculata grandiflora, that its heavy flower heads break off by their own weight, or are borne to the ground. Grow the plant as a standard not less than five or six feet high, and this objection loses its force. There is a wonderful degree of elasticity in the plant. A couple of weeks since my standard plant was bent clean over by a very heavy rain and wind storm, the stalk forming an arch. It was straightened up again after the storm without having received the least damage. The flower heads, by their gradually increasing weight by degrees curve the branches, which gives the plant the appearance of a graceful, pendulous dwarf tree.

HORTICOLA.

PASSAGES IN MUSHROOM CAVE.—FIG. 278.

Electrical Effects.

If at or near periods of intense electrical disturbance of the atmosphere pear blight and kindred diseases common to vegetable growth make their appearance and develop in their most malignant and destructive ways, and if at such times some not well understood form of electricity attaches itself to the trunks and limbs of trees and vegetation generally, one can see how it is that a coating of linseed-oil or whitewash applied to such exposed vegetable surface might prevent attacks of disease like pear blight, provided pear blight arises from some such cause. Prof. Thomas and other entomologists of reputation, agree that the so-called "twig" and pear blight now so extensively prevailing in the West, is not in either case the work of insects, and they seem willing to admit that unusual electrical conditions may be the cause. W. F. J.

Field Crops.

MY EXPERIMENTAL PLOT OF WHEAT.

HUGH L. WYSOR.

IN making the experiment of which the details are given below, my object has been to ascertain the following things: whether the thin seeding of wheat and the after cultivation of it have any influence in increasing its yield beyond that of broadcasting or drilling in the common way; what results are to be looked for from the application of common salt; whether there is any great difference in the time of ripening of wheat sown at different times in the same location.

The experiment was conducted with three kinds of wheat, not, however, with a view to ascertain their comparative yield, for they received too different a treatment to admit of that. The plot, as before noticed in the RURAL, consisted of two acres, lying in one body, of the same general character—a light sand—and capable of producing without manure 75 bushels of corn per acre. One acre was given to my own cross-bred wheat—Fultzo-Clawson; one-half acre to German Amber, a wheat distributed by the Department of Agriculture, and one-half acre to Boughton.

The plot of Fultzo-Clawson was divided into two pieces of three-quarters and one-quarter of an acre respectively. After the ground had been turned two weeks before planting four bushels of salt were sown broadcast on the rough ground of the three-quarter piece. On the 18th of Sept. the ground was harrowed, laid off into narrow drills ten inches apart with a marker, and both pieces planted by hand at the rate of one bushel per acre, the smaller receiving no manure of any kind. The wheat was then covered by the roller. The larger piece was cut June 16th perfectly ripe, the straw being of a golden yellow color and the yield 21 bushels of good wheat. The smaller piece was harvested June 21st; wheat fair but the straw not perfect; yield four bushels. I conclude from this that an application of five bushels of salt per acre will prove at least a partial preventive of mildew, will hasten the ripening of the grain nearly one week, and will increase the yield from five to ten bushels per acre.

The half acre of German Amber was planted on the 15th of October alongside the plot above mentioned. It was planted after the same method as that, except that no salt or other manure was used and twelve quarts of seed were sown by means of a small drill. No signs of the Hessian fly appeared in this plot in the Spring, though the one sown nearly a month earlier was considerably injured by this pest. This piece having rusted badly, was cut, still green, on the 15th of June, and yielded 14 bushels of tolerably good wheat.

Plot three—half an acre of Boughton—was heavily manured with stable manure, and sown by hand at the rate of one peck per acre, in scores six inches wide with intervals of 12 inches between the rows. One-half of the plot was planted Oct. 22, and the other half a week later. After the wheat came up, it was again manured, row by row, with chicken manure. Two-thirds of it was thoroughly hoed twice—once in April and once in May—the other third being left without any cultivation. I could observe no difference whatever between that which was hoed and that which was not, nor was there any difference in the time of ripening of the two parts sown at an interval of one week. The whole was cut June 10th, a week earlier than number one, which was sown over a month sooner. The yield was 16 bushels of second-rate wheat. Such a vast mass of straw as this crop exhibited was probably never grown in this country. The stalks were 5½ feet in hight, and stood like a solid block. Farmers will have some idea of the quantity of straw when I tell them that 72 dozens of sheaves were harvested. The plot was unquestionably over-manured, and ran to straw in consequence.

Although last year I expressed an opinion favorable to it, I am now compelled reluctantly to confess that the cultivation of wheat is time and labor thrown away. As to thin seeding, one peck to the acre will be sufficient, provided the land is in a sufficiently high state of cultivation, and the sowing is done after the method of plot three. Making the scores, however, was with me a tedious and laborious process, as I had no implement for that purpose. I made them by stretching a rope across the plot and drawing broad hoes along the the line. The covering was done with a hand rake.

The seed wheats came from the Agricultural Department. It appears to me that the Department has been unfortunate in its selection of the persons from whom it has purchased wheat the distribution. The German Amber, mentioned in this report, had several kinds of bearded wheat in it, besides some little barley and rye. It was also, when received, not entirely free from cockle. The Silver Chaff, received two years before, was badly mixed with at least eight kinds of wheat. The Gold Dust (1877) was worse still. I have just now received four quarts of White Australian on the sacks of which is a printed slip stating that this wheat was almost entirely free from rust in years when the Clawson and other kinds were nearly ruined. One has no need to wait for another harvest to see whether this statement is true. Looking into the sacks one would think that if it did not have the rust, it had something as bad or worse, for the grains are shriveled, many of them sprouted and weather-beaten, while among them are some little cockle, the seeds of the wild onion or garlic—a great pest in the fields of tidewater Virginia and North Carolina—and a few grains of smut. Farmers who are simply raising wheat for market cannot avoid getting their grain mixed, for many kinds are carried about in the thrashing machinery from one stack-yard to another. But persons who are offering new wheats at high prices can certainly afford to keep them pure and clean. I do not wish to be understood as saying anything in disparagement of the department, for I presume it does the best it can.

Pulaski Co., Va.

MR. GREGORY'S EARLY SWEET CORN.

IF the Minnesota Corn had been planted at the same time as the above variety at the RURAL FARM, I think it would have matured as soon. I am about one degree of latitude south of the Farm, and can therefore plant a little sooner. In order to get along in time with the Spring work, I usually plant my earliest corn during the third week of April, taking the risk of a May frost, which rarely injures it. This does not come up so soon by a week as that planted later in the season, when the ground is warmer, for the first stages of its growth are slower. I picked a good mess July 6th. This was probably 75 to 77 days after planting. I did not take account of that planted the 20th of May, as your Mr. Gregory's was, producing a mess in 61 days; but, I have no doubt the ears of my Minnesota were forward enough for a mess in 63 to 65 days. I will time my pickings another year from the planting through April and May.

I prefer the Minnesota to any early sweet sort I have yet tried, because the stalks grow about five feet high. It is an abundant producer, and the ears are larger and have larger kernels on them, than any other of the earliest kinds. I do not like the dwarf sorts, the stalks of which scarcely grow above three feet high. The ears of such are so small as to be scarcely worth cooking; and if they come a few days earlier than Minnesota, Concord and some others, this does not compensate me for their diminutive size, although it may those who are more ambitious than I to pick an extra early mess. A. B. A.

BLOUNT'S CORN, MOLD'S ENNOBLED OATS, COW-PEAS, THE CUTHERT RASPBERRY, Etc.

JONATHAN TALCOT.

IN regard to Blount's Prolific White Corn, I can only say that it does not seem to suit my farm, or the cultivation I gave it, or it may be that the latitude is wrong for its greatest perfection. First, it will not get ripe, and for a fodder corn the stalks are too large and the leaves too scarce to be of any especial value. I notice some of your correspondents say that it grew 14 feet high, and their cattle ate the stalks all clean, although they were as large as a man's arm. That may be true; but my cattle will not do it, but perhaps I have not got the right kind of cattle, yet I can't afford to change them now. At least I think I had better plant a different kind of corn for the animals I now have, than to get those that will eat Blount's corn as it grows with me, and mine did not grow 14 feet high, but the stalks were more than half wasted for the want of cattle that would eat them clean. I did not blame my animals, however, but intend to give them corn that they will eat in future, and I think a kind that will be better for them also.

The cow-pea is another forage plant that does not fit my soil and cultivation. The few I have are 15 to 18 inches high, just blossoming, while the corn on the same soil and under the same cultivation is from six to ten feet in hight, well eared. One hill of corn taking up no more room than one of cow-peas, will produce ten times the weight of fodder, I think, thus making a decided difference in favor of the corn as a fodder plant.

Mold's Ennobled Oats—"Well, what of them?" I fancy I hear some one say. Well, I can't say much in their favor, for I think they are only the Norway Oats that had such a widespread circulation a few years since. The color of the oats, their growth and lateness, all indicate their origin, and I must say I can see nothing but the Norway Oats in growth, form of panicle, etc. Others, no doubt, will differ with me in my opinion. Well, we must agree to differ, then, and let the matter rest till one or the other party is convinced of error.

From the Cuthbert Raspberry I did expect something valuable, as it was so highly praised, and when the plants came they seemed so well packed that I was pleased with their outside appearance. The label also read well, saying that they had been grown by a certain nurseryman and put up expressly for the RURAL NEW-YORKER'S free distribution. What could be more pleasant than such a package under the circumstances? But, alas! all my high expectations vanished on opening the package; one plant was without roots, simply a piece of top six inches long, the other without any bud or sprout to grow at all, so the best I could do was done in hopes to induce a growth for the rootless stalks if possible, and to induce a bud to start in the other; but with all the care I could give them, they both failed and my expectations were blasted for this season.

So far I have not been successful either in forage plants, or the raspberry, but with corn as a fodder plant, I have a very fine growth of a few acres. The Early Minnesota Sweet Corn is now fit to cut for the animals, well cared and of good growth. Moore's Early Concord will follow with Evergreen for the latest cutting. The Evergreen is now 10 feet high, and a thick heavy growth much larger than I had anticipated on the plot of ground on which it was planted. I will give my manner of cultivation.

The soil is sandy gravel, naturally warm, and of moderate fertility; in fact, not rich enough to produce satisfactory crops without manure, which I did not have in sufficient supply to feel sure of a full crop. Consequently I purchased a little superphosphate to give the corn the benefit of its effects (if any) in its earliest growth. As the crop of field corn was planted, having a little manure yet in the cattle yard, we scraped together what we could and spread it on the plot to be planted to sweet corn for green fodder. The piece had wheat grown on it the year before, the ground having been plowed in the Fall and replowed in the Spring before applying the yard manure, also after the manure was applied. The reason why I plowed so many times was that a part of the piece had an abundance of Quack-Grass on it, and I wished to destroy that, if possible. Everything was now ready to plant corn on the 25th of May, the plot having been harrowed and marked. We then put about a tablespoonful of the superphosphate at each crossing of the marks, covering it slightly with mellow soil, and planted the corn on the places thus prepared.

The cow-peas and Mold's Ennobled Oats also occupied hills thus prepared in a row by themselves in that portion of the field planted to Early Minnesota Sweet Corn; so they have had as good care and cultivation as the corn. The corn was cultivated frequently till too large to allow the use of a horse and cultivator, no hoeing being done at all. It should have been hoed once, I think, but other labors prevented

this, especially the cutting of our early hay crop.

The result—the Minnesota Sweet Corn was fit for table about the 1st of August and was the largest crop of forage corn ever grown on the farm, of that variety; and the feed is now very opportune to feed to any animals, from fattening hogs to dairy cows and working horses. All like it and it does them good to eat it, as it increases the growth of the young stock, also the milk from the cows, and puts flesh on the fattening animals, and for the crop of 1881 it increases the manure pile in the cattle-yard, making labor, and increasing the products of the farm at the same time. For the calves we cut the green corn ears, and stalks, so that nothing is wasted. For the older animals it is simply put into their mangers and all is eaten without waste. For horses it is also cut in the hay cutter before being fed, and if any is left—which is not often the case—the refuse is taken from their mangers and fed to the cattle and all is thus eaten up clean.

We cut our corn soon after dinner and put it in the managers for all animals, except the hogs and horses. The hogs have theirs thrown into their yard; the horses get their feed at night; the cows and other animals feed on the corn fodder in the afternoon, and thus partially avoid the flies, as these do not annoy them as much in the stable as in the field, as we close the doors of the stable when the cows are put up. They go into the field at night and in the forenoon to graze what they will before and after their feed of corn.

[It is right that we should remark that Mr. Mold does not claim that his oats or wheats are *new* varieties, but old varieties "ennobled," to use his word. The Ennobled Oats are the Black Tartarian, as has several times been stated in these columns. Eds.]

POTATOES IN THE SHADE—PLASTER—POTATO-BALLS.

No doubt potato bugs avoid vines growing in the shade, and thus if the mature insects are very hardy, the larvæ are quite susceptible to cold. This fact may be used as a means to destroy them. If just previous to a cold rain storm or a change which lowers the temperature from ten to fifteen degrees, the larvæ are brushed from the vines they will become so chilled and benumbed that they will lie there and perish. And this suggests that if large potato fields were gone over with a roller before or during cool weather the result would be to destroy a great many bugs and with no injury, if not with positive benefit, to the crop.

It has been suggested that Paris-green not only does no injury to potato vines, but seems to revive and lighten their color. This improvement is probably due to the presence of the plaster in which the poison is extended, and is a good reason why it should be chosen in preference to dry ashes, lime or flour.

In my experience with potatoes I have found the popular varieties, like the Early and Late Rose, the Peachblow and the Early Ohio, exceedingly shy bearers of seed balls. Indeed I don't know that I ever saw one of these on the Early or Late Rose in a course of fifteen years' cultivation. But this year I procured a few pounds of a new potato, Wilder's Seedling, I think, planted them in ground very heavily fertilized with a half-and-half of wood and coal ashes, and the production of seed balls is something surprising—two or three quarts to 40 hills. What is the explanation? Is it in the variety or the fertilizers used? The vine growth has been large, and from the bursting of the hills, I conclude the yield will be handsome. B. F. J.

Arboricultural.

WIND SHELTERS.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

I welcome earnest opinions. I like the mood that holds them by a firm though easy leash. There is no divine right of thought, no infallible council. The faith it might set up to-day would be upset to-morrow. Truths and methods upheld by sound logic and trial, stand; whims backed by flimsy props go down with the first push of sense.

The mighty changes in our century in thought and methods are the outcome of a mental temper which favors neither the old nor the new but for the logic and tests behind them. They owe nothing to guess or cavil. Showy veneers or shammy novelty have no place in the work. No opinion gains a lasting foothold unbacked by sound logic. None but those who study up the records of trial and opinion ought in any line to start a new departure. None but such should sit in the philosopher's chair and essay to tear down or build anew the ideas of man.

I say these things in view of the RURAL's lately-quoted doubts of a writer about the good of shelter to the garden or the orchard. I wonder that the RURAL did not demur against such a rash opinion, backed by such thin, disjointed logic. I hope either the writer's doubts or mode of putting them will gain but a lean following.

This is the argument set to his credit:

PROPOSITION. — Close, overhanging shade and smothering belts of hedge and vegetation around the house shut out the healthy currents of air. The dryness of the breeze, thus barred leaves dampness to beset its borders, inviting mildew, miasm, fungoid growths and insect pests. The brooding shade and closeness make the cellar dank and unwholesome; the closets distil vile smells and viler vermin; every corner riots in uncleanliness.

CONCLUSION.—Just so, where you shut out the currents of air from the garden and orchard by belts of verdure, you invite to fruit and flower like harm. The inside stillness, stirred only by the sifted breeze, breeds hurt to leaf and limb. Insects swarm, fungoids and noxious dampness beset its growth and fruitage. In short, the way to a healthy garden and orchard is over an open field, where nothing stays the sweep of the Summer breeze or the frosty grasp of the wintry wind.

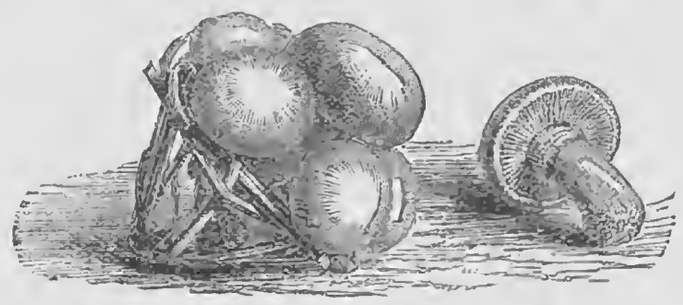
This is the frail logic backed by which this writer asks us to uproot an old belief which study and trial tell us stands on hard-pan.

But if shelter and belts of dense growth hurt the garden this writer does not prove it by showing how they smother and befoul the home. The hedge may hurt in a different way. The dampness, the unaired closeness of the dwelling may be just what the garden likes. If a hedge hurts vegetable, flower, or fruit, the harm may come from causes very unlike dampness or shutting out the currents of the air. Because a thing is bad to have in the house it does not follow that it may not be the best possible for the garden. In fact, to each it does pretty much so happen.

HOW EXPOSURE HURTS AND SHELTER HELPS.—I know and yearly feel the good of shelter to the garden and the orchard. Ten miles of unbroken wintry winds sweep down upon my place from the high hills. Along the rift of a valley they pour dry and frosty. Lots of plants and shrubs rejoice and bloom not three hundred feet to the leeward which come to grief on my premises. A belt of trees and fence and houses sift and temper and bar out the frosty currents which strike me so savagely.

THE GOOD OF WIND SIFTS AND BREAKS.—In Summer or Winter anything that checks the wind blast helps the growth and yield of vegetation. No vine, plant, or tree but joys to have stayed the whirl and thrash of leaf and limb. It is not the northern blast—stiff, dry, and frosty—that alone hurts. The full sweep of the early or midsummer breeze singes like a fire blaze the young growth of leaf and shoot. The snap and whip of the wind blasts and blackens the tender foliage and unripened wood. This hurts and dwarfs both the tree and the maturing fruit. The growth of the stock and the swell and lusciousness of the fruitage feed through the leaves on that full flow and alchemy of the sap which sunshine and shower provide. When the leaves are maimed and stripped, when the dry wind drinks deep the moisture of the soil, that work stops.

What does the above author find common to the home and things rooted to the soil? Nature does not admit the likeness. The home longs to the other. What likeness has the being or purpose of the dwelling to that of the garden? What is akin in the life and growth of vegetable and man. A regimen good for one might work disease and death to the other. What cures the ills of the dweller and his home might kill the fruit-tree and the



MUSHROOMS, READY FOR MARKET.—FIG. 279.

potato. The house is a shelter and defense against the rough and raging moods of the air and climate. To the garden we welcome pretty much every phase and belonging unlike that courted in the household.

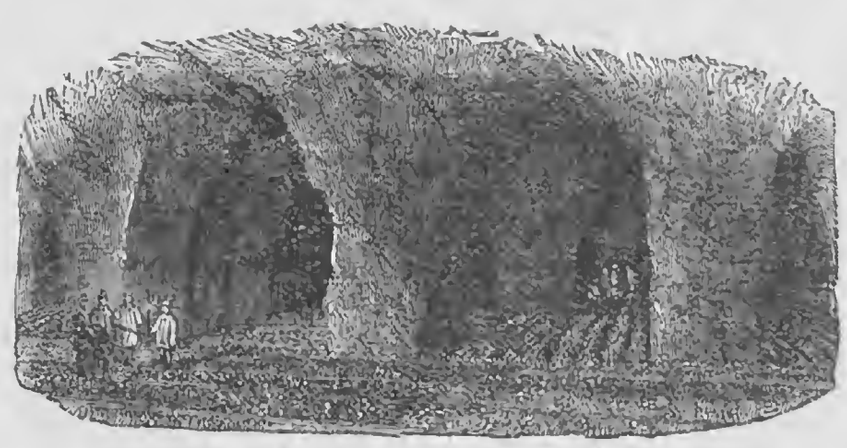
SHELTER HELPS AND SAVES THE FRUIT.—Then, all the way from the blossoms to full ripeness, the whirl and twitch of the limbs in high winds, strew the ground with half-grown fruits and bruised ripeness. The stillness and steady warmth of a belt-girt fruit garden, stay this waste and sorrow. This shelter rewards all cost and care by the better wood-growths, and better fruits. In such a choice spot you can have those that outside are stolen by frosts and wind.

SOME HURTS TO THE HOME HELP THE GARDEN.—The dampness which harms within the house is a joy to the garden. The rootlets drink in the wet with joy, and send it through the currents of the sap, to feed substance to leaf, wood and fruit. There is such a thing as too much wet inside or outside of the hedged garden, but good soil is not likely to keep more than is good for it. The surplus finds its way down to the lower water-levels and drains to rill and rivulet, to take its round again in nature's wondrous movements. The fault of the climate is, not too much wet, but that the soil too soon parts with its moisture.

SHELTER MAKES THE GARDEN COSY AND PLEASANT.—When outside your sheltered garden all is shake and shiver, and the breeze or chill air currents beat against your wall and curse their lookout; within its sunny nooks, stillness prevails; no wrench and twist of limb, or trunk, disturbs. The little feeding rootlets are not torn and worn off by the swaying of the tree. The steady warmth inside your barrier sends you down a full degree of latitude in early growth and maturity. Give me shelter for vegetables, flowers and fruit, against the hasty, frosty moods, and footsteps of the air! It may be had by hedge, or tree belt, or in some still and sunny glade or valley walled in by hills. Fear not dampness or mildew, or fungoid growth, or insect pests, merely because the wind is stayed in its wild work.

It matters little wherewith you make your shelter. The best is, I think, a valley defended by hills, against the rush of winds. The quickest shelter for small areas, and, when well made, the best, is a high, tight board fence. This should be held up by stout posts, fastened by iron pins on to stone bases. Fruit trees may be made to pay good interest on cost of such by trailing grapes on galvanized wire held out some foot or so from its face. Its face southward on the garden will ripen grapes that you can never get a crop from in open grounds, and so of other things that need long and high heat to ripen.

Not a small comfort in a sheltered garden is the quiet warmth of its sunny corners. In such there is a sense of defiance and comfort. The scream and roar of the shut-out wind, fall on your ear like the pouring rain on some sheltering roof. In Fall and Early Spring, and



VIEW IN A MUSHROOM CAVE.—FIG. 280.

and things rooted to the soil have not enough in common to warrant his logic and advice. Trees and flowers live under laws unlike those befitting the dwelling. They have their being and best estate in unlike footings and environment. It is, therefore, not very good logic or doctrine that counts on like needs or ails, or like cures or preventives for both. There is hardly a feature or quality of the one that be-

even in bleak, dry days of Winter, there is joy in a sunbath in its quiet nooks. There we stop to rest and chat, in the round which every lover of the garden makes again and again among his trees and shrubs. One never tires of such review, there is no sameness in this dress parade of his favorites. Each round offers some new feature of interest, or presents some new subject for his care. Thus your shelter overpays its cost in increased product and home zest.

The Catalpa.

I am at a loss to understand the puffing given to the Catalpa in latitudes where there are half-a-dozen other native trees superior to it, measured by the shade they afford, their beauty as a tree, and the value of their timber. Among these are the Osage Orange and the Blue Ash for hard woods, and the lime or basswood and the cottonwood for the soft-wood trees. As for lasting qualities, there is nothing superior to the Osage Orange, whether small or large, in the ground or out of it; and the timber of the Blue Ash has almost every excellence—strength, size, durability, elasticity, hardness, and toughness. Besides, like the Osage Orange, it grows readily when transplanted, acquiring that merit from its numerous fibrous roots which the Osage Orange does from its soft ones, which considerably resemble a carrot in color and consistency.

B. F. J.

Pomological.

SOUTHERN FIGS.

IN answer to B. F. J., in RURAL of July 24, I may state that during a long residence in Texas, I have never seen a barren fig tree. The chief difficulty in the way of utilizing this fruit, except for home use, is that in moist weather they sour very quickly. Last evening I picked a small basketful, and after we had eaten as many as we wanted, I had to throw the remainder away this morning, owing to their sourness. Another objection to their larger cultivation here is, that they grow so easily and are so plentiful that they are considered of no value.

About a quarter of a mile from where I live, are a number of trees that were planted fifty years ago and all the time they have been exposed to all the cattle and horses running wild on the prairie, so it can at once be seen that they are long-lived, for they bear fruit every year. The owner of the place is still living; but he now resides out West, having left this country when Santa Anna was driving all before him, until Sam Houston stopped his career at San Jacinto.

The trees I grow—latitude 30 deg.—are the Violet, a large fig, and a small yellow one. I do not know their botanical names, but they are good enough for any one. Some cuttings that I put out last Winter, are two feet high and have fruit on them now. They seem to grow like a weed, and chickens and hogs are remarkably fond of the fruit. My trees, about 20, are eighteen years old, have never had any disease, and produce all the time up to frost. They seem to grow well in any soil, either in sandy or clay land, in the woods, or on the prairie, in dry weather or in wet. They stand head and shoulders above all the lazy men's fruit, that I ever read of, as they require no working, manuring or trimming.

I do not know that I can say any more in their favor, unless it is, that I never saw any one that was not fond of them—children more especially. As one offset to the above, I may state that I have planted three orchards of peach trees during the last twenty years, and always made a failure. To-day I have not a peach tree, unless those I planted last Fall.

As the years roll along, I become still more strongly impressed that the bulk of the fruit business will remain in the North. A few down South, possessed of rare energy and executive ability, will succeed, but the bulk of us will be driven to the wall. Cotton will always be our main dependence. No spot in America can compete with us in that. Early Amber Sugar-cane can be raised in Minnesota, but the North must take a back seat when it comes to cotton picking. And though it is not a very paying crop under our present system of labor, I begin to take heart under the cheering articles of your intelligent correspondent, W. I. Chamberlain, on Western Farming.

Our present old-fogy system of going four times in a row, must be superseded by a riding cultivator going once, and doing the work equally well. I am afraid I am too old for this myself, but my boys must be taught to do it, as well as to use that big harrow that crosses *three* corn rows at one swoop. G. G.

Dayton, Liberty Co., Texas.

FRUIT NOTES.

WE have suffered in this vicinity nearly the whole Summer long from a severe drought. The strawberry harvest was injured considerably, especially on thin, dry soils. Raspberries and blackberries were quite reduced in size, many of the latter shriveling upon bushes which were mulched for any ordinary season.

Among varieties of strawberries, I was much pleased this season with the Duncan, Prouty's Seedling, Monarch, Cumberland Triumph, Sharpless, Miner's Prolific, and Glendale. The Sharpless did best with me where fully expos-

ed to the sun, and the Monarch where somewhat shaded. The Sharpiess ranked first in health and vigor and size of single berrles, but second in quality and quantity of fruit. Miner's Prolific, on my grounds which are principally a sandy loam with light clay subsoil equals it in everything except vigor and excels it in quantity and especially in quality of fruit. The Crescent Seedling gave very fine returns where grown in narrow matted rows, on semi-heavy, deep and very rich soil. With me, Miner's Prolific has given excellent returns under all kinds of fair treatment. The Glendale is only second to the Sharpless in vigor of plant, in health and prolificness, and has fruit of good quality, and excellent staying qualities as to length of bearing season.

Bartlett pears were ready for picking by Aug. 10th. Souvenir du Congres on the 16th.

Among grapes, the Champion, Hartford, Israella, Adirondack and Moore's Early are ripe except an occasional cluster. They have ripened quite unevenly, and the season has rather intensified the unpleasant qualities of some of them. Among grape novelties set on my ground this season, the Bacchus at this writing has excelled all in growth of wood; the Prentiss ranks second; Jacob Rommel's Elvira seedling, Faith, third; Pocklington, Vergennes and Don Juan, and several of Rommel's Taylor seedlings, fourth on a scale of 10. The Lady Washington, Eldorado, Highland, Jefferson, Advance, Imperial, Wyoming, Florence, Concord, Muscat Concord, Chasselas, Centennial, Sharon, Noah, Duchess, Poughkeepsie, Linden, Lexington, Eugenia, Augusta, Belinda, and Antoinette are especially healthy for such a season. I am fruiting the last two of the above list, and will report in detail at a later time. The Brighton vines, with me, have been slow growers the first season, but vigorous in growth after that. Their foliage this season, is very fair, but it has been injured somewhat on young plants, as has also that of the Duchess, and of a few other varieties by the rose chafer.

Livingston, Co., N. Y. R. A. WATERBURY.

The Peach Crop of Illinois and Missouri

is reported as very large in quantity, but poor in quality, few of the best specimens even being free from worms. From present indications, peach-growing, already in its decay in the old States named, will have to be remitted to the newer portions of the far Southwest, as, for example, to Northwestern Arkansas, which is said to possess a soil and climate admirably suited to the peach and the grape.

Conversing with an intelligent lady from Louisiana recently, she said no small part of the failures in orange, fig, tea, and olive growing was due to the frequent attempts made to force their growth beyond the natural climatic limit assigned to each, for above 30° or 31° fruitfulness and healthy development could not be counted upon. B. F. J.

The Vineyard.

TRAINING AND PRUNING GRAPES.

S. B. PECK.

I find many beautiful illustrations of various methods of performing the above operations, but I have never seen any one of them carried out to the perfection shown in the plates. In fact, I have rarely seen any one plan, as they appear in the books, attempted and persisted in for any length of time, except that recommended by Strong—a flat trellis about two and a half feet high and about as wide, allowing the vines to run over and hang down the sides as they please. This plan has with me worked very well, but it takes more work than some others with the hoe, and less can be done with the cultivator. For this, I set posts eight feet apart; saw them square at the top before setting, and set by a line, lay 2x6 inch blocks across the top, and fasten them with spikes; then nail 16-foot strips on the ends of these blocks; then nail, as may be needed, a half length of lath across.

I see that there is some controversy about the distance apart at which grape-vines should be planted, and I know two growers who, having planted in rows eight feet apart, the vines eight feet apart in the row, have eventually dug up every other vine in the row, and claim to have thereby increased the yield of fruit. That the increased yield should be the result of this process, if the vines are trained by the ordinary hap-hazard method, I can easily believe, without admitting any benefit from the increased room for the roots or vines.

The natural tendency of the vine is to keep increasing its length from year to year, bearing its fruit further and further from the stock, leaving at the base bare wood, constantly increasing in length. All pruning has for its main object the keeping of the vine within the prescribed bounds, and the occupying of the trellis with bearing instead of bare wood. Is it not possible that the thwarting of nature in this matter is one of the causes of rot and mildew so prevalent in places? I do not assert this as a fact, but I could give my reasons for believing it to be so.

To avoid this necessity for short pruning to prevent bare wood, I have hit upon the following plan, which I intend to put in practice at the next Fall pruning with my three-year-old Concords and other rank-growing sorts. We will suppose a trellis of four bars or wires and two main canes. Tie these two canes to the lower bar 12 to 14 inches apart, then fasten the upper end of each to the third bar at an angle that just allows them to reach that point, both running parallel with each other in the same direction to form the angle, the acuteness of which will depend on the length of the canes. Allow these main canes to increase in length from year to year, two or more feet, giving them a more acute angle as their length increases; prune to short spurs; their length depending on your experience and judgment. By this process you will see that the bearing wood of one vine overlaps the bare wood of its neighbor, occupying all the trellis, and year by year approaching nearer a horizontal position.

I am aware that this plan is open to criticism, and that there may be found objections that I have not forseen: but objections may be made to all the plans I have ever seen, and the most forcible objection is, that to carry them out needs more care and close attention than one man in a hundred has the patience to give them. I shall follow the same plan with my flat trellises—train all the canes one way, the way the prevailing wind blows as nearly as may be, and let the fruit-bearing part overlap the barren part, thus giving Nature more of her own way.

I propose now to give some of the observations that have led me to this plan. The first specimen of grape pruning and training that I ever saw was attended to year after year by an old man, who had been much in foreign countries and who pruned close to a single cane trained horizontally some four feet high, giving it all the length that his limited area could afford. The varieties were Isabella and Catawba, his latitude Western New York, and his success satisfactory to him. In sight from where I now sit, I have a single old Concord vine trained on a trellis 12 feet long and eight feet high. In the Fall-pruning the bearing wood is brought to any point where there is the most room for it, up, down or horizontally. The trellis abuts upon a fence, and some five years since I trained a rampant shoot upon the fence, giving it all its length. It has been annually pruned to spurs of three to four buds, has always borne a monstrous crop, and has now about nine feet bare at its base; while 18 feet are loaded with fruit, and there is an extension of six feet, the growth of this year—33 feet in all.

I have other grape-vines bearing fruit 25 or more feet from their bases. They are on trellises six feet high and eight feet apart, with long canes thrown across them, and trained on crossbars six to eight feet apart. The best fruit has always been overhead, but now, after five years' bearing, there is little on the side trellises, which is not the case with the vine first mentioned, no part of it being shaded.

Sheboygan, Mich.

Dairy Husbandry.

FALL-PACKED BUTTER.

HENRY STEWART.

THE harvest of the "farm dairyman" is just at that time when the Summer creameries curtail operations. Then the market is relieved of a pressure, prices stiffen up and inquiries become more active for choice butter. Then is the time for the private dairyman to push his goods forward. "Dairies" are then wanted, and if the quality of the butter is right, the prices are just as "right." The aim of every butter maker should be to become independent of market prices, and to produce such a quality of goods as shall sell at special rates and shall also secure a constant purchaser. To do this he must make a choice article, of course; but it is far more important that his butter should be packed to keep.

Some years ago I packed a 50-pound pail of butter in June, and put it away for a year. When it was opened I thought the butter as good as, if not better than, the newly packed, and it was sold as new-packed without question. Some years before that I examined some tubs that were packed by an Ohio dairyman 10 months previously, and the quality was so excellent that the memory of that butter remains as a bright, indelible spot upon my mind.

In these instances it was the packing that not only preserved the butter, but improved the flavor and deepened the color. From those Ohio tubs I learned a lesson, for I could see the points in the packing, and gained a wrinkle for my own future use. Now, for the credit of that Ohio dairyman, who was and still is a farmer of Cuyahoga county, in that choice region known as the Western Reserve, I will describe how his butter was packed, and merely say that my own method later used, was similar to his, with the exception that I used the "Westcott return butter pail," holding 50 pounds, while he used new white-oak firkins of 100 pounds each.

The butter was well made and salted to keep, with the usual proportion of one ounce of salt to the pound. The tub was not all packed at once, and in opening it, the contents were found to be in layers, with distinct strata of what had been salt, but was then briny moisture between them. The firkin was new and sweet; it had been well soaked in brine before the butter was packed. Each layer of butter was packed solidly, with no holes in it and no open seams around the outside against the staves. As each layer was packed it was covered with brine, until another was ready, when the brine was poured off for a new packing, a little salt was scattered over the surface of the last layer and upon the sides of the firkin. Three packings filled the tub in six days. When the tub was filled a piece of fine white muslin soaked in brine was spread upon the top (a similar piece was placed at the bottom previously), salt was sprinkled upon that and the head was pressed in with a lever: then the hoops were driven down, and this tight packing made the butter as solid as it could possibly be made. The tubs were kept in a spring-house, the hoops were tightened occasionally, and when the tubs were shipped, the hoops were again driven down and nailed with tin tacks, which did not go through the staves and stain the butter as iron nails do. The butter was made in September. The 10 tubs which I examined were shipped to the backwoods in Northern Michigan, in May, and were not opened until after midsummer, and the last was not all used until September, and this butter brought joy to our lonely camp.

Afterwards I found the maker, a Mr. W——, from his brand on the butter, who told me his story. The secret of this success is easily seen. Mr. W—— made good butter, packed it in perfectly clean, air-tight packages in such a manner that they were kept air-tight, and so the good butter was well preserved. What is to hinder any other farmer from doing the same? If Mr. W——, who was then, and is doubtless now, a reader and a friend of the RURAL NEW-YORKER, should see these lines, I am glad to assure him that the occurrence referred to helped very much to make a dairyman of me, and that I do not think I ever made butter equal to that lot of his, for it was the best I have tasted, to the last pound.

Farm Topics.

CO-OPERATION AMONG FARMERS.

WE are apt to suppose that what is natural is about right. Now, it seems to be natural that there should be a flow of population from country to city, and that the increasing population of cities should stay there. But there seems to be something wrong about this. City life is so wearying and exciting that it burns out the energy, life and vigor of the inhabitants, that must be renewed by constant influx of people from the country. Imagine New York, for instance, with an embargo against immigration for fifty years, what would be its condition at the end of that time? There are too many people in our large cities. This is evident by the amount of poverty and destitution among certain classes. There are thousands of acres of land within a hundred miles of New York that need the labor of the starving populace of that city. These acres offer homes and subsistence in return for labor. The trouble is that our people are not satisfied with these. They want palaces and luxury. Country people hear of the fortunes that are occasionally made in cities and impelled by that gambling spirit that seems to be almost inherent in humanity, rush off with hopes as high as their knowledge of the world is deficient expecting to strike a bonanza and get rich in four or five years. So broad acres are left untilled for want of tillers, and others are only half worked, at an expense of labor and capital which, if confined to smaller space, would better repay the investment.

My thoughts, while here, have been called to the need or advantage of co-operation among neighboring farmers, that could, I think, be readily had through the medium of farmers' clubs. For instance, two progressive farmers have determined to build silos and try the experiment of making ensilage from maize. Now, this may or may not prove successful. If it should, they have taken a risk which benefits the whole neighborhood. If it proves a failure, the whole loss falls upon these two enterprising individuals. Now, why ought there not be a contribution from all interested, including all farmers in the vicinity, to furnish the funds necessary to try this experiment. These funds the treasury of a farmers' club should supply, as a loan, to be returned only in case the experiment proved no loss. Through such an organization also should other experiments be made, such as testing new varieties of fruits, grains and vegetables. If farmers in different parts of the township would cultivate the same kinds of seed on different soils and in different situations, their reports at the end of the season would be of great value to others. Why should the time and labor of 50 be spent in making experiments when those of five would be just as conclusive.

In this connection, I would again call attention to a matter to which I have before called attention in the RURAL—that is, the importance of establishing a museum of natural history in every township. Every town should have a Town Hall. Against the walls of some room in the building should be cases in which to place specimens of insects, birds, vegetables, plants, wood, fruits, in fact, of every thing of suitable size found in the township. To prepare these may seem at first thought to be great labor; but it would not all be done at once, and when persons become interested in doing it, the collection would grow rapidly. With an active farmers' club to give incentive to such a beginning, and make it a duty for such as are chosen to perform it at first, the work would go on rapidly, and in a few months a collection would be made the value of which, for educational purposes, can hardly be overestimated. L. A. ROBERTS.

NOTES FROM MEADOW GLEN FARM.

A SYSTEM of mixed husbandry is carried on on this farm. Hay is the principal crop; 75 or 80 tons are cut annually. A sod field is plowed for corn, which is followed by oats and wheat in rotation. Several acres in orchards give a good supply of apples and pears, which are sorted, barreled and sold to special customers. The land has a gentle slope to the south and east, while the northern and western portions are dry upland, and the remainder natural meadow and pasture. The upland is a clay loam, the meadow a mucky soil.

A herd of grade Jersey and Ayrshire cows is kept and the milk made into butter and sold to special customers in Saratoga. A flock of Meadow Glen Downs, with a few South-Down sheep are kept for mutton and wool. Berkshire swine are raised for home use, with a few of the best for sale. Several broods of pure-bred poultry are also kept for home use, also for sale. None but thoroughbred males are kept or used, and the best of young animals of all kinds are raised for use and for sale. Large heaps of manure are made and applied to the corn-field, and large heaps are also drawn out, to become well rotted for wheat in the Fall. Phosphate of lime is the principal artificial manure. The seed is often changed and obtained from a distance, as I think a change of seed increases the vigor of the grain. A fine row of maple trees along the road, set out many years ago, make a fine shady drive through Meadow Glen Avenue. In laying stone walls we bank up with dirt on each side to make it more firm. Young fruit trees are being set out from year to year for improvement.

WHEAT ACCOUNT FOR 1880.

DR.	
Plowing land	$9 00
Harrowing	4 00
Drilling in seed	2 00
Seed	12 00
Phosphate	10 00
Harvesting	10 00
Thrashing	15 00
Interest on land	27 00
	$89 00
CR.	
140 bushels of wheat, $1.25 per bushel	$175 00
Straw (estimated)	25 00
	$200 00
Deduct expenses	89 00
Net profits	$111 00

This from 4½ acres; the soil being a clay loam. Yard manure was well harrowed in at the rate of 10 loads per acre, and the phosphate was applied in the drill at the rate of 100 pounds per acre, the wheat was very plump and nice and of the Diehl variety. The yield, it will be seen, was a trifle over 31 bushels per acre. A. H.

The Apiarian.

THE QUEEN BEE.

THIS most important member of the busy commonwealth has been appropriately called the mother bee. Laying all the eggs in the hive she is truly the parent of the entire population — drones as well as workers. The ancients, indeed, having an imperfect knowledge of the internal economy of these communities, misnamed her *king*, conceiving it to be the office of so distinguished a personage, to regulate and govern the masses. This erroneous notion has perpetuated itself in various countries, even to our day; and we not infrequently meet with beekeepers who receive it with implicit faith. Yet, whatever be the special opinion of some, the large majority of intelligent apiarians concur in assigning to her

the character she can justly claim—that of being the common mother of the family. So long as she is present in the hive, all the eggs found therein are laid by her. The truth of this may readily be ascertained by introducing an Italian queen among common bees. All the young subsequently hatched from her eggs, both workers and drones, will wear the livery of the foreign race; and the old stock will gradually disappear, none of their own "kith and kin" being thenceforward produced.

It is thus rendered certain that all the eggs originate with the queen. But as the cells in which the drones are bred differ in breadth and diameter from those which cradle the workers, and drones are besides reared at certain seasons only, the queen must evidently possess the ability to distinguish between the two kinds of cells, and to lay male or female eggs at pleasure, according to the needs of the colony. That she has this ability is an undeniable fact, however difficult it may be to account for or explain it. The function of the queen is simply to lay eggs, and thus keep the colony populous; and this she does with an energy that is fairly startling. It is nothing uncommon for a good queen to lay 3,000 eggs in 24 hours. We may confidently assume that a vigorous queen may annually lay from 150,000 to 300,000 eggs, or at least 1,000,000 in the four years that constitute the average duration of a queen's life.

A queen is developed from an egg in 17 days in a preconstructed cell, but will issue from what is called a post-constructed cell, sometimes as early as the eleventh or twelfth day. Queen cells are usually built on the edge of the comb, or around an opening in it, which is necessitated from their size and form, as usually the combs are too close together to permit their location elsewhere. These cells extend either vertically or diagonally downward, are composed of wax mixed with pollen, and in size and form much resemble a peanut. The eggs must be placed in these cells, either by the queen or workers. Some apiarists think that the queen never places an egg in a queen cell, but I have no doubt of the fact, though I never witnessed the act. I have frequently seen eggs in these cells, and, without exception, in the exact position in which the queen always places her eggs in the other cells. I know that when royal cells are to be torn down, and inchoate queens destroyed, the workers aid the queen in this destruction. I have also seen queens pass by unguarded queen cells, and yet respect them. I have also seen several young queens dwelling amicably together in the same hive.

The queen is larger around the body than the worker, but not as large as the drone. Her body is longer than that of either, gradually tapering to a point. She has a sting, but uses it only upon meeting a rival in royalty. The queen usually leaves the hive only when accompanying a swarm, and when a few days old, to meet the drones, for the purpose of becoming fertile. Once becoming such, she is so *for life*. The old poetical notion that the queen is the revered and admired sovereign of the colony, whose pathway is ever lined by obsequious courtiers, whose person is ever the recipient of loving caresses, and whose will is law in this bee-hive kingdom, controlling all the activities inside the hive, and leading the colony whithersoever they may go, is unquestionably mere fiction. In the hive, as in the world, individuals are valued for what they are worth. The queen, as the most important individual, is regarded with solicitude, and her removal or loss noted with consternation, as the welfare of the colony is threatened; yet, let the queen become useless, and she is dispatched with the same absence of emotion that characterizes the destruction of the drones when they have become supernumeraries. It is very doubtful if emotion or sentimentality is ever a moving force among the lower animals.

There are probably certain natural principles that govern in the economy of the hive, and aught that conspires against or tends to intercept the action of these principles, becomes an enemy to the bees. All are interested, and doubtless more united than is generally believed, in a desire to promote the free action of these principles. No doubt the principle of antagonism among the various bees has been overrated. Even the drones, when they are being killed off in the Autumn, make but a sickly show of defense, as much as to say: "The welfare of the colony demands that such worthless vagrants should be exterminated; so mote it be; go ahead." It is most probable that what tends most for the prosperity of the colony is well understood by all, and without doubt there is harmonious action among all the denizens of the hive, to foster that which will advance the general welfare, or make war on whatever may tend to interfere with it. If the course of any of the bees seems wavering and inconsistent, we may rest assured that circumstances have changed, and that, could we perceive the bearing of all the surrounding conditions, all would appear consistent and harmonious. LIGURIAN.

Floricultural.

Petunias in Vases.

I often hear women speak of petunias as poor flowers for cutting purposes, and my own experience is quite the reverse. I regard them as among the best. To fully appreciate them, they should be arranged in flat dishes in which twigs from evergreens, or small-leaved deciduous shrubbery have first been placed, and form a support for the petunias. When this has been done and the dish has been filled with water, cut the petunias and stick them around in the green stuff as quickly as possible, so that they do not wilt. A large, shallow plate can be made to have quite a decorative purpose for the table arranged in this way. Considerable skill can be displayed in the arrangement, too, if one cares for that, by placing the blossoms in rows, making each row of the same color or variety. A petunia bed at night and at morning is the most deliciously scented thing that I know of; and the only thing about one that is not absolutely delightful, is that it cannot be taken up at will and set in the midst of the dining table for a centerpiece. You, who have morning-glories, pick at night the opening buds and arrange them as described for petunias. Put the dish on the breakfast table. Next morning you will find that the glories of the morning preside at your meal. MARY WAGER-FISHER.

Bryn Mawr, Pa.

Give Plants Plenty of Room.

In the cultivation of flowers, I find that most people do not give them room enough in which to grow to perfection, and hence they do not feel satisfied with the seed, and will often condemn the source whence it comes, as the flower is not as nice as the catalogue cut represented it to be, while the fault is wholly, or in great part, on their own side, in not giving room enough to the plants. Now, at the present time, I have in my garden several plants from seed sown last Spring, as nice as the cuts in any catalogue show them to be, and a plant of the Shell Flower far excels the cut in the catalogue of the nurseryman from whom the seed was obtained. When planted out in good soil, I find that Phlox Drummondii will spread its branches so as to cover a space 18 inches across, and most annuals will be much more beautiful if given plenty of room; therefore, do not try to crowd too much into a given space—better have less in number, and have them nicer. F. H. D.

Corning, N. Y.

Miscellaneous.

JOTTINGS.

SALT MARSH HAY.—The tables given by Mr. Stewart, in his article on the Dairy Cow, page 520, showing the relative value of feeding stuffs, are interesting, and if we could regard them *even* "as approximately correct," as stated, they become more so. Beside the difference in corn cobs and corn stalks noted I have been interested in the high value given to salt hay, exceeding even that of corn cobs and stalks, as well as Timothy hay, ripe and in full bloom, all the straws except bean, and nearly equal to ripe clover. Again, the amount of fat accorded it exceeds that in all the straws and hays, peas and rye. This will hardly be accepted as correct or approximately so, by the practical masses, as it is completely at variance with the oft-repeated and quite general belief that a pound of fat never came off the salt madows in the shape of salt hay. Anyone at all familiar with this product knows that it differs very materially in quality. Bright, clean, fine salt hay is considered best for horses, and black grass, got in early and in good order, best for cattle, and both are regarded by old farmers hereabouts as about equal in money to half the price of fresh hay.

HOEING.—"It requires but a little skill to hoe a row of corn, etc." The above, from a recent editorial in the RURAL, will be accepted as true according to the value each individual places on the merit and thoroughness of the hoeing and the object sought. The term "to hoe" covers a wide range of soil manipulations, and the operation is one of the most important of all the small labors in the garden, and if but "little skill is required to hoe a hill of corn," in my experience that little is more than one in ten ordinary laboring men possesses. If hoeing corn consists merely in hauling the earth to, and making a mound up *around*, the stalks to shed off the rain, then I yield the point at once; and where the cultivator has been freely and properly used, the area about a hill of corn, for the skillful exercise of the hoe is, I confess, very limited, and in many cases is regarded as not existing. Aside from the destruction of weeds, hoeing corn, as I use the term, embraces breaking the crust, loosening and pulverizing the soil close in and about the stalks and roots of the young plants for the free passage of warmth, air and moisture, and leaving the ground nearly level.

In the finer and more varied operations of the garden or field culture of small fruits, the hoe plays a more important part, and in strawberry culture especially it is the most important of all implements used, and requires more *skill* to use it expertly than many people are aware of. In all my long experience I have never found a hand who, after years of trial and repeated showing, could or would hoe a row of strawberries so nearly like one of my own—which he was to imitate—but that I could tell at a glance which was his. From this I conclude that skill and imitation—the former being the successful application of the latter—are qualities seldom found or successfully developed in such material as we have to rely on for help on the farm or in the garden. In other words, competent and skillful hoers are like angels' visits—few and far between.

OBSCURE WRITING.—The most successful teacher is the one who can the most readily impart his ideas to his pupils. The best writers are those who can express their ideas so plainly and clearly as to enable the most undisciplined mind to comprehend them, and the beauty of all writing is its perspicuity; and yet how often do we find an attempted description of an implement or method so obscure as to baffle our best efforts to understand the writer's meaning. For instance, in the last number of a neat and sprightly contemporary, hailing from the city of Brotherly Love, the editor in an article on the fall planting of strawberries, among other things, describes in this wise a machine for cutting off the runners.

"A circular knife fastened to a 10-inch, wooden wheel made of one-half-inch plank. Let the knife project two inches from the wheel. This knife may be made in segments of steel or heavy sheet-iron ground sharp. At the end of the five-foot handle bolt a bent bar of ¼x1½-inch iron so that the ends project 10 inches. Two inches from the ends of this bar punch holes for the axle of the wheel to run in; put washers on each side of the wheel to make it run true. It is now ready for use. Push the wheel before you with sufficient pressure to cut the runners. You can run as close to the plants as you please, and if the plants are set in rows both ways every runner can be cut off."

Is not half an inch rather thin for a plank? Almost any one with any gumption could rig up a machine that would answer the purpose, but I have been wondering how many readers could build one from the above blind description and have it accord with the writer's ideas. Descriptions of simple contrivances like the above, though perfectly plain to the writer are often of no use to others, simply because of their ambiguity and lack of clearness. A simple illustration is often most effectual in conveying ideas and should be used where the importance of the matter will justify. Other portions of the above-quoted article are stolen verbatim from other sources without a word of credit, and appear as original with the writer. When one engages in plagiarism of this kind it would look a little better and more creditable to change the clothing of the ideas sufficiently to give at least the *semblance* of originality. KIT.

THE BUFFALO HONEST FERTILIZERS.

EVERY year the use of commercial fertilizers is rapidly increasing throughout the country, except in those newly-settled districts in which the exuberant fertility of the virgin soil has not yet been sensibly impaired by repeated croppings. Hundreds of thousands of dollars are annually spent by the farmers of this and neighboring States on these sources of fertility, and it is much to be feared that no small proportion of the outlay brings no inadequate return in the shape of increased crops, owing partly to the unskilled mode in which they are used, partly to the unsuitableness of the fertilizer employed either to the soil or crop to which it is applied, but mainly, perhaps, to the inferior quality of the fertilizer.

It is chiefly to protect the agricultural community against adulterations in such fertilizers that Experiment Stations have been established by the Legislatures of this and other States, and the experience gained in these amply demonstrates the necessity for some means of the kind for protecting our farmers against fraud in the sale of such commodities. There is no doubt that when the New York Experiment Station is in working order there will be a weeding out of some of the brands of fertilizers now on the market in this State, and a considerable improvement in others, as the constant liability to detection and exposure of any adulteration or other fraud in their composition must force the makers to fair dealing.

There are some fertilizer manufacturers, however, whose goods have always been so honestly put up that the establishment of the Station will have no effect in causing them to change their mode of action, while it must greatly benefit them by spreading abroad the knowledge of the excellence of their wares, and by driving from the field unworthy and dishonest competitors.

Among these L. L. Crocker, manufacturer of the Buffalo Honest Fertilizers, stands in the front rank. We have used these fertilizers on the RURAL FARM, where they proved quite satisfactory. We also know of many who have used them more extensively than ourselves, and for a number of years, who speak very highly of them, and some of whom now use no other commercial fertilizers.

The Ammoniated Bone Sperphosphate has for its basis bone, blood, meat and potash, and therefore is a complete fertilizer, being rich in nitrogen, phosphoric acid, and potash. It is well adapted for grain, roots, grass and garden crops, and at Mr. Crocker's office in Buffalo we have seen a goodly number of testimonials as to its efficacy from farmers in different parts of this and the neighboring States, speaking in the warmest terms of its excellent effects on corn, wheat, oats, barley, rye, buckwheat, grass, tobacco, hops, fruit trees, etc.

From the nature of the ingredients the effects of these fertilizers on the soil are more lasting than those of ordinary bone or mineral superphosphates, and their value is otherwise enhanced by the care bestowed on their manufacture and the pure quality of the sulphuric acid used in making the superphosphate. One of the RURAL staff has carefully examined the process of manufacture, the crude materials, and the manufactured goods, and speaks strongly of the skill and honesty that distinguish everything connected with the business.

We would advise all our readers who can conveniently get their fertilizers from Buffalo to investigate the merits of the Buffalo Honest Fertilizers before investing their money in such goods indiscriminately. Full information will be promptly furnished by Mr. Crocker, together with the names and addresses of a large number of farmers who can speak highly of the excellent effects produced on various crops and soils by the application of different quantities of these fertilizers. An inferior article loses in reputation by investigation and trial; a good one gains thereby, hence the high esteem in which these fertilizers are held by those acquainted with their merits.

To Keep Eggs Fresh.

Take them daily from the nest and pack, *small end down*, in any clean and sweet non-conducting material, like fine sand, sifted coal or wood ashes, and set away in any cool and dry place where the temperature will not rise above 75°, or, better, 65° or 60°. Where these conditions are to be attained, preservation in lime-water or salt is wholly unnecessary, because of the extra trouble and expense, and because limed eggs are at best flashy, if not worthless things, and finally, because the air being excluded in the low temperature maintained, eggs will keep sweet and sound for months. B. F. J.

FACTS AND OPINIONS.

I keep my dried berries, etc., in strong paper bags, tied firmly, and stored in a dry, dark place. I stand the bags on the end that is tied. Unless great care is exercised the insects will find an entrance.

A Rochester grape grower brings to market the earliest Concords and the largest clusters, and secures about double price. His secret is girdling the vines. Last season, I visited a vineyard near Lake Ontario, that had been girdled for years, yet the vines were extremely vigorous and healthy; they were bearing a heavy burden of fruit, and the clusters and berries were marvelous in size and of excellent quality.

Wild strawberries invariably possess vigor and hardiness, else they could not exist in old meadows and stumpy clearings. It is interesting to plant them in the garden and watch the results. Those I planted last Fall have sent out a mass of runners. The plants resemble the Crescent Seedling closely. I have found wild strawberries as glossy and beautiful as costly gems, and of exquisite quality. Among them we need not look for monsters in size. We are, in fact, getting over the craze for big strawberries.

Artists often seat the milk-maid on the left side of the cow, make the wood choppers left-handed, and construct impossible rail fences in their illustrations. These slips we can overlook, but when they attempt to make a team draw a load of hay without any wagon tongue, as was done recently in a popular journal, we must indulge in a mild protest.

One hundred pounds of old woolen rags, properly prepared, will fertilize an acre of land, but I shall continue to litter the pig-pens with care, and save the last remnant from the barn-yards. G. A. GREEN.

CATALOGUES, ETC., RECEIVED.

BAIRD & TUTTLE, Bloomington, Ill. Catalogue of 100 pages of fruit and ornamental trees, shrubs, roses, bulbs, herbaceous and garden plants. There is a good deal of originality about this catalogue, and some of the

illustrations, especially the leaves of the Japan Maples, are true to life.

SAMUEL KINSEY, Kinsey's Station, near Dayton, Ohio. Wholesale price-list of fruits, etc.

T. S. HUBBARD, Fredonia, N. Y. Wholesale price-list of grape-vines, fruit trees, etc. Also circular with colored plate of the Prentiss Grape, with testimonials from many of our first pomologists as to its value.

LIST of Premiums and Rules and Regulations of the Ninth Annual Exhibition to be held at Rochester, N. Y., on the grounds of the Rochester Driving Park Association, Sept. 28 to Oct. 1 inclusive. H. A. Kingsley, Secretary, 118 East Main Street, Rochester.

PETER HENDERSON & Co., 35 Cortlandt Street, New York, Circular of Pot-grown Strawberry plants. Also pot-grown grape-vines. A colored plate accompanies this circular showing that Mr. Henderson has changed his views somewhat as to what varieties make up "the cream of the strawberries." He now names Glossy Cone, Sharpless, Juennda, Harvey Davis, Seth Boyden, Pres. Lincoln, Black Giant, and Monarch of the West. The pictures are handsome, but far from portraits.

DR. RYDER'S American Fruit Drier or Pneumatic Evaporator. New Principles of Fruit Evaporation by the American Drier Company, Chambersburg, Pa. Those interested in this subject should send for this treatise of 24 pages, which is fully illustrated. The sum of $225 is offered for the best exhibits of fruit dried by their evaporators.

BRIEFLETS.

PROF. BURRILL (Illinois University) has inoculated sound pear trees with the bark of stems that were blighted. In this way the disease has been conveyed, the same as yellows in the peach may be conveyed by pruning a healthy tree with a knife that has been used upon one having the yellows. . . . . Prof. Budd, of Iowa, mentions Oldenburgh, Alexander, and Constantine (Russian apples) as among profitable market sorts. . . . . Mr. Potter calls liquid manure "the wine of the barnyard." . . . . . Some women were evidently "born to blush unseen," at least they were never seen to blush.—Cincinnati Sat. Night . . . . . It will soon be time for the papers to announce that they give themselves away . . . . . , A farmer 70 years of age remarked to the writer, while plowing under an oat stubble rank with weeds, using a Syracuse chilled plow to do the work: "I would not take $50 for it if I could not get another". . . . Bicycle races are to be a grand feature at all of the forthcoming fairs . . . . It is time to prepare the ground for new asparagus beds . . . . The Nation refers to farmers as simple-minded but sagacious men . . . . . Gov. Furnas pronounces the Prentiss, as to quality, the finest hardy white grape he has ever tasted . . . . . Readers are requested to note how well or how ill our summary of "What shall the Harvest be," coincides with the facts which are now appearing. They will the better know another year how much confidence to place in our Special Crop reports. . . . . Many of our farmers who were visited by the Army worms last season fear that they will reappear next season in still greater numbers. But there is room to doubt that such fears are well grounded. Their sudden disappearance is more easily explained than their sudden appearance. They have many enemies among birds and parasites which, during seasons when the worm is abundant, seem to give themselves up to their destruction. . . . . It seems that there never has been so large a demand in St. Louis as at present for cider mills. . . . . The Cultivator, commenting upon our remarks as to the Turner and Cuthbert Raspberries and the Snyder Blackberry, says of the latter, there is no other to approach it for hardiness, and it is profusely productive. The size of the berry is the only drawback. . . . . Mr. S. Miller of Missouri, tells the Rural World that the new Black-cap, Hoosier Mammoth, is larger than the Gregg and of fine quality as well as more productive. . . . . A friendly contributor suggests that it would be a good idea to publish a comic paper with an Agricultural Department. . . . . "I never see," says Mr. Robinson of the London Garden, "half enough of pinks, carnations or picotees in gardens." The same thought has often occurred to the writer of these notes. We do not think of any other plant that is, in all respects, more satisfactory. . . . . There are few yellow flowers that at this time would make a better show in garden borders than those of lettuce. The variety with crimson or bronze leaves would add attractive foliage also. . . . . If you have any real greatness you won't go far before the world will find it out. Small men insist that they are great, while great men can afford to keep still. The Talmud says that "all kinds of wood burn silently except thorns, which crackle and call out, 'We, too, are wood.'" . . . . . "Emerson says his orchard has paid him better than his literary works."—Scribner. . . . . The Western Rural says that it does not believe there is a genuine case of pleuro-pneumonia in this country, and if there is any way to muzzle the scribblers who are writing about something that they know nothing of, the man who can suggest it will be a public benefactor." . . . . . The surpassing advantages which our "first-class Summer resorts" present as the best teachers of "decorous dissimulation" is pretty well understood by those who frequent them. . . . . Soft soap is recommended as a cure for ivy poisoning. . . . . Under the title "Impressions of America," we find in the Hour the following remark: "American women seem to have only one necessary thought when they see a new man: 'How much is he worth?' Such thoughts deform and harden the most handsome faces." . . . . . The Ohio Farmer offers this bit of advice to those who attend agricultural fairs: "Do not hang around the race track all the time, and then blame the Board for encouraging horse racing." . . . . . It is to be hoped that those who attend fairs this season will resolve beforehand not to find fault with the awards of prizes. Judges are not paid for their services, and, as a rule, they award prizes, according to the merits of exhibits as they seem to them. There is, no doubt, favoritism sometimes. But it is the exception. . . . . .

WHAT OTHERS SAY.

THE Prairie Farmer remarks that it has often been said—and is worth repeating because it is an important fact—that our Fall fairs have been of great benefit to the cause of agriculture. They are really institutions of practical information—schools for the farmer and his family, where object lessons meet the eye on every hand which may be, and are, turned to good account. Contact with others, a comparison of results in the production of crops, or stock, and other things on the farm, or in the dairy, in the orchard or in the vineyard, cannot fail to be of advantage to an intelligent observer.

A WRITER in the same journal gives his testimony as to the clover field being the farmers' national bank, whence he can draw—if he has deposited liberally—without fear of "protest." He has corn that is a foot taller than he can reach with his cane, in which a horse would be hid at two rods' distance, on land where five years ago his son said the corn did not pay for cultivation. Cause, a good clover and Timothy sod turned under last Fall. We can get this sod on any of our prairie soil. Of course a little manure will help it along, and when we have a good sod, who does not know we can raise anything we choose.

ROLLERS.—Mr. Geddes spoke of the economy of buying sections of old steam boilers for farm rollers, which can easily be fitted with skeleton heads, and can be bought cheap and answer the purpose. Mr. Geddes related his experience in rolling wheat on certain soils containing clay, where Fall rolling causes the formation of scale that eventually kills the wheat. On sandy or light soils Fall rolling is generally advisable. A roller is a dangerous tool in inexperienced hands. He gives the following rules: Roll soil that you wish to compact, but if not, let it alone; never roll in wet weather. Clay soils may be rolled in the Spring but not in the Fall.—Syracuse Journal.

MR. Charles A. Green, our valued correspondent at Clifton, N. Y., writes to the N. Y. Tribune of a factory in which sour cider is stored in a tall tower and made into vinegar during its twenty-four hours' passage to the ground floor.

CLEMATIS LANUGINOSA.—Notwithstanding the many fine varieties of clematis that have been raised and distributed during the past few years, the species above named is quite unrivaled for the great beauty and substance of its magnificent flowers, the color of which is of a rich delicate azure blue, and the size as large as or larger than that of any variety extant. It is one of those real good things discovered and sent home by the late Mr. Fortune, who found it growing on the hills of Che-kiang.—London Gardener's Chronicle.

"VULGAR ERRORS."—Under this head the Gardener's Chronicle has the following: "It is odd and not a little disappointing to see how people go on harping on old exploded prejudices. The recent committee of the House of Commons on the potato disease affords an example. The committee is reported to have upheld the exploded fallacy that varities die out. Properly fixed and properly cared for, they do not die out. The old Ashtop Kidney is as vigorous now as ever under proper cultivation, but it has been displaced by Myatt's Prolific and other sorts."

COLORADO'S GOOD LUCK.—We take the following from an editorial in the N. Y. Sun:—"The so-called Colorado potato beetle has probably done more to advertise and make Colorado known as a Territory and State than almost anything else, her silver mines, perhaps, excepted. The common name of the insect has called the attention of not only the people of the Eastern States, but those of all European countries, to the region whence the pest came, and from looking up its location on the map it is but natural that a person should seek further information in books and periodicals, all of which has been a standing advertisement for Colorado, and has helped to bring her what may be termed good luck. A million of dollars expended in advertising would not have kept the country so constantly before the people as the Colorado potato beetle and what has been written about it by entomologists and correspondents of the agricultural press." Under the circumstances, we should think Colorado could afford to pay the other States for some of the damage which the potato beetle every season perpetrates.

"UP to the time I was 40 years old I put forth all my efforts to increase my income. Since that time I have been equally careful to decrease my expenses." It strikes us there is much of wisdom in this plan, and that a careful examination will reveal the fact that it is excess of expense rather than want of income which keeps farmers poor. Waldo, of the Ohio Farmer, suggests, then, as a fruitful theme for correspondents, "How can we lessen the expense of farming?"

MR. BATEHAM.—W. I. Chamberlain, Secretary of the State Board of Agriculture, was invited to speak at the funeral of the deceased. This he did in a very earnest and sympathetic manner, remarking truly that, "not an orchard or grain field in Ohio but has felt the influence of his labors for the improvement in varieties cultivated and in modes of culture." He was always a constant attendant at all the important meetings of the State relating to agriculture and horticulture, and his face and voice will be sadly missed in the future.

WE have a fine white mulberry tree in the lawn that bears a bountiful crop every year. To my eye the tree is a most pleasing one—very symmetrical, graceful, and of great delicacy of form, but strong and vigorous. It reminds me in appearance of a gentle and well-bred lady, and I always like to look at it at all seasons of the year. Why do not people, especially farmers, make it a point in their tree-planting, to include one or two of the mulberry tribe? The fruit ripens early, at a time when fresh fruits are scarce, and although very sweet, the berry is liked by most persons, especially when eaten from the tree.—Mary Wager-Fisher in N. Y. Tribune.

NEW JERSEY CRANBERRIES.—Prof. Cook says: New Jersey produces about one half the cranberries grown in the United States. The yield last year was 75,000 bushels, but there are now indications of a failure in the crop in some quarters. The fruit scalds. We are at work to discover the cause.

EXPERIMENT STATIONS.—Dr. Ledoux, speaking of the New York Experiment Station, remarked at the late meeting of the Board of Control that he felt embarrassed to speak of his own labors. The State of North Carolina has the most economical legislature—it has even taken away the Governor's servant, so that his Excellency had to provide from his small salary, a person to light his fire, but it did not refuse to grant an appropriation for the Experiment Station. He had no doubt that it saved to the State $250,000 a year. Formerly there were 108 brands of fertilizers in North Carolina. They have been examined according to law, and one was found that contained 80 per cent. of sand. Others were so poor that they were condemned in Georgia, and then reshipped to North Carolina. He was satisfied that since the official investigation, fertilizers are cheaper in North Carolina than they were before the tax was imposed; that they are better on the average, and as cheap as elsewhere. His experience is that on some soils great benefits are derived by their use, while on other soils no perceptible advantages are derived. He was desirous that the New York Experiment Station should succeed. If these stations are multiplied throughout the States it will be impossible to estimate the advantages derived.

Dr. F. M. Hexamer remarked that science and practice combined are the only way to get knowledge. Experiment stations will be of vast benefit to our farmers. He was glad to be present and witness the enthusiasm of the members.

The Chairman asked Mr. O. B. Potter to tell about his experiments with ensilage.

He replied that he had tried it thoroughly and was satisfied that it will be of immense benefit to our farmers. He cut up clover, green rye, green oats, millet, sorghum and corn stalks, in fact everything of a green nature fit for fodder. These he cut up in pieces, about one inch long, which were put up into silos, or vaults, built for this purpose—these undergo a certain fermentation. When these silos are opened and fed to his stock, they eat it with avidity. New York has made an appropriation for experiments; if these are properly carried out it will be of great benefit to our farmers, not only in this State, but in the whole country.

GAMBLING AT FAIRS.—Mr. Slossom expresses himself as follows in the Western Rural: "The State fairs can stand up under a heavier load of wickedness than county fairs, because their back is stiff, by reason of patronage from all parts of the State. Looking at the programme of our next State fair, we see there are seventeen hundred dollars devoted to the heels of fast horses, and all the demoralizing influences of these performances are thrown in to lead astray our sons instead of teaching them lessons of usefulness in their calling. The managers make pretence of great morality, and take great pains to exclude common gamblers from the grounds, but when you come to the speed of horses gambling is rampant, but it is on the speed of that noble animal, the horse, instead of on the dice board.

CAMP MEETINGS.—Doubtless much of the reproach which has been cast upon the morality of camp meetings is undeserved, remarks the Hour. A comparatively small number of offenders are able to bring any assembly with which they are associated into disrepute. The world is always eager to detect flaws in characters or institutions that make professions of godliness. It is, in fact, the assumption of superior fervor and piety by the leaders of these assemblages which has tended to excite distrust of their methods and results. The emotional appeals which are the staple of camp-meeting exhortations are apt to be deficient in common sense. They inflame the feelings, but do not convince the reason. Their influence is, therefore, not only likely to be transitory in its effect, but tends to foster an illiberality that shuts the door of innocent amusements. This religious asceticism is responsible for a good deal of the dissipation which has of late years made camp meetings fall into disrepute among many truly devout people. Such dissipation is the not unnatural reaction from a too rigid formalism.

SPEAKING of the Ohio State Fair, Secretary Chamberlain remarks in the Ohio Farmer: The railways intend to give the same exceedingly liberal excursion rates to our State Fair, and to run special trains for the fuller accommodation of the public. The attractions at the fair, too, are even greater than last year, and with favoring skies we hope for the same immense throngs of visitors, and the same remarkable financial success we had a year ago. Every dollar of surplus will be faithfully used in promoting the best agricultural interests of our State.

Everywhere.

RURAL SPECIAL REPORTS.

CANADA, Mount Irwin, Ontario Aug 20.—Fall wheat is a total failure in this township of Galway, but Spring wheat is a fair crop. Oats are splendid. My Mold's Oats are ready for cutting, they have beat anything I have seen. They are about five feet high. Peas are a good crop and so is barley. Hay was rather light on account of the clover all being killed out. Potatoes were badly nipped on the night of Sunday the 15th when we had a frost unusually hard for this season. I am afraid the later sorts will not be of much use; but Early Rose are nearly ripe and are very good both in quantity and quality. J. B.

CONN., Bloomfield, Hartford Co., Aug. 21.—I wrote the RURAL before, my letter appearing in the issue of Aug. 3, that the apple crop hereabouts was very large this year. The trees are overburdened, and while I have been writing a large branch of one close by, no longer able to sustain the weight of its fruit, has fallen with a crash. I cut a twig from a seedling tree standing by the road-side a few days ago, which had, on five inches of stem, nine apples. Another had set and commenced to grow, but being cramped for room, gave it up. The tobacco crop is now being gathered and is in good condition, being large and of fine quality. In a piece near-by leaves measuring over 40 inches in length are plentiful, as are also those from 20 to 24 inches wide. If the extreme length were with the widest leaves there would be some monstrous in size, but such is not the case. The amount of weight of plant that will grow in so short a time from a minute tobacco seed is wonderful. I believe it is conceded that more weight is made here by tobacco than by any other crop in the same time, and the growers are not ready to accept the theory that the plant takes no part of its sustenance through its leaves. I have been made glad by observing that birds are more numerous here than in former years. It is to be hoped that farmers will finally be led to believe that birds do them more good than harm, and will aid in their protection. L. A. R.

IDAHO, Genesee, Nez Perces Co., Aug., 18.—Our soil is new and fertile and the cultivated acreage is being increased largely. Owing to the grasshopper and the extreme heat, with hot winds, our crops have been damaged, causing almost a total failure in some localities; but in this place we are more favored. Wheat, flax for seed, barley and oats grow abundantly here, but will all fall short of an average this year. Corn is but little produced outside of the garden. Sorghum has not been tested. The potato and many other vegetables are abundant. The Ovoid Mangel and Ennobled Oats succeed here. The cow-pea is a failure. Small fruits, such as currants, gooseberries, blackberries, raspberries and strawberries do well. Larger varieties have not been fairly tested yet. G. R.

IOWA, McGregor, Clayton Co., August 20—My place is on River Hill, 300 to 400 feet above the level of the Mississippi, opposite the mouth of the Wisconsin River. The land is rich—not as rich as some and not as poor as some, but pretty good. Now I know this to be so, because the potato patch, just along side of the wheat patch, produces the biggest crops of grass and weeds I ever saw in my life. Why, they grew so fast and got so big at last, that I couldn't plow them out. When I left the battle was still raging, and the potatoes crying for quarter. A late despatch from the battle field states that Major-Gen. Foxtail had gained a complete victory; the last intelligence states that a small brigade of General Potato's forces had escaped and were strongly intrenched. I hope they will hold out. Well, it is not much use to go back and tell what kind of a Spring or Winter we had five or six months ago. Suffice it to say we have had as fine a season as any one could desire, and it is my opinion that the crops are unusually fine, though I have not been round through the country to make observations, except once—on the 10th of June, when I had the pleasure of a ride out to the county seat, 20 miles across as good a farming country probably as any in the State. At that time growing crops of all kinds over the prairie were a splendid sight. However, as a wheat buyer said to me, "We can only tell what the wheat crop will be when we get it in the half bushel." We have had splendid weather for harvesting. Farmers are not yet through stacking, though a great majority are. One of my neighbors had 20 acres in Lost Nation, wheat—good heavy wheat it is. This kind fails, I believe, in a good many localities, from some cause or other. Thrashing has not commenced in this neighborhood yet, but will, I suppose, in a few days. There is a heavy crop of apples in this section wherever the trees are in bearing. Wild blackberries are selling at 10c. per quart. The crop of strawberries was light owing to neglect, which is probably the true reason of failure in a great many other things. J. R. J.

IOWA, Le Mars, Plymouth Co., August 20.—The grasshopper pest destroyed nearly all the small grain in several of the counties of Northwestern Iowa last year, and farmers, as a rule, sowed less this year. This Spring opened very dry and windy, blowing the small grain in many fields entirely out of the ground, so that much of it had to be planted to corn. A few pieces of wheat, sowed on last year's breaking, are excellent, yielding from 20 to 30 bushels of No. 1 wheat; in fact, the wheat is generally good—what there is of it. The few hot days in the fore part of July, blighted a small percentage of the wheat and made the oats light in weight. There was very little barley sowed here—yield rather light. Considerable flax was raised, and it will yield from six to twelve bushels of seed per acre. But little sorghum was planted; much of it has been sadly neglected and it will be a light crop. Corn in this part of Iowa is above an average crop. It bids fair now to yield from forty to sixty bushels. The small package of Mold's Ennobled Oats received from the RURAL last Spring, I drilled in on a piece 4x5 feet in my garden. The hot weather made them very light—I have got only about one pound. I think they would do well here in a season favorable for small grain.

W. B. M.

IOWA, Wolfdale, Woodbury Co.—Wheat here will yield from 15 to 30 bushels per acre; oats from 25 to 50. Corn is still "booming," but wants rain badly. Wells and creeks are drying up fast. Grass is good on low lands.

H. T.

KANSAS, Parsons, Labette Co., August 16.—We have the finest crops ever known in Eastern Kansas. Grass, fruits, roots, grain, and castor beans are all good. Corn is a better crop than ever known. Upland and lowland have both done excellently. So far neither floods nor storms have done any damage. The husks on the early planted corn are white. Our Texodusters have succeeded in raising a good crop of cotton, yet it will prove injurious to them and the country if they, from this instance, repeat the attempt, as experience here is adverse to success. If they have more skill in the business they may do better than their predecessors. But the summer season is too short. Our neighbors in Northern Texas are jubilant over their corn and cotton. Both crops are splendid. We shall supply them with considerable wheat; but hardly any corn. The Rocky Mountain locusts have been so few this season that they have excited no comment. Yet they have not failed to put in an appearance. A week or two ago, while the wind was in the northwest, I shaded my eyes and looked as near the sun as I could, about midday (this being the best time to observe), and saw the little white specks floating in the wind away up hundreds of feet. They seemed like small flecks of snow. I think we are never free from them, and it is only under circumstances favorable to their propagation in the mountains that our great affliction from them comes. Our farmers have made an astonishing increase in capital. There is not an unimproved quarter-section from here to the county seat, a distance of 20 miles, and were you to see some of the localities on the line, their houses, barns, fences, osage hedges, orchards, avenues of trees, and fields of corn and wheat, you would have an extended conception of American agriculture. Wheat is coming in to market. The quality is not quite equal to that of last year's crop, nor is the yield; but the increased acreage will give an aggregate of one half more. Vegetables and fruit are very plentiful. Cabbages, three cents; apples, 50c.; peaches, 50c. to $1.50 per bushel: melons two to five cents each, fine and good: potatoes, 40c. per bushel; prairie hay, $2.50 per ton, delivered to consumers; oats, 15c. per bushel; corn, 20c.; wheat, 60 to 75c.; flour, $3 per 100 pounds; butter, 10c.; eggs, 8c,; coal, $2 50 per ton. J. B.

MO., Pleasant Mount, Miller Co., Aug. 29.—The weather has been exceedingly dry for the past six weeks, and has damaged corn very badly, so much so that in dry, sandy, or rocky soil it will not yield ten bushels to the acre. The ground is very dry—too dry to plow for wheat. Stock of all kinds are suffering for water, as the continued drought has dried up all the small creeks, and in many cases stock have to be driven two or three miles to be watered. Wheat is yielding well. Although this is not really a wheat country, yet enough is raised for home consumption. The extensive range here makes stock the principal dependence of the farmers; hence we see more cows, meadows, and pastures than we see in Southern Illinois. Wheat is worth 75c; corn, 30c; oats, 25c; young hogs that will do to push along and fatten for market this Winter, are selling at $3. per 100 pounds. N. J. S.

N. Y., Little York, Cortland Co., Aug. 19.—Farmers are in low spirits in this section, on account of the grasshoppers, which have destroyed fully one half of their Spring crops, including grass. Potatoes were an exception and they look fair at present. D. W. C.

NORTH CAROLINA, Brookston, Warren Co., Aug. 23.—After a dry April, May and June came frequent showers with an excess of rain in early August. Crops that were clean when the rains came are wonderfully fine. Such corn and cotton I never saw here before. Tobacco has been injured by too much wet—drowned in some places. That early-planted which had the top leaves well grown when the rains came is hard to beat. Fodder pulling began last week. Of four varieties of corn, Blount's is earliest, and gives most fodder. Turnips are getting a fine start. Cow-peas are making an extraordinary growth of vines. Grapes are nearly all gone, and I believe at quite satisfactory prices. M. B. P.

OHIO, Van Wert, Van Wert Co., Aug. 20.—So far as the products of the farm in this section are concerned, we are well pleased. The yield of wheat will average 20 bushels per acre. Oats are light; potatoes good; corn is very promising for a heavy crop. Fruit is about half a crop. Farmers are well supplied with reapers, mowers and labor-saving agricultural machinery, and now considerable attention is being given to underdraining with clay tile.

E. R. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Experiment Needed.

S. W. H., Hempstead, L. I., says that his farm comprises 175 acres of tillable land. It is mostly black "plain" soil capable of yielding, in the present condition, half a ton of hay per acre, in an ordinary year. He wishes to grow hay on the whole of it, and asks whether it would be well to plow 90 acres of mellow ground next Spring, sow on it corn broadcast, using a quarter of a ton of special corn manure per acre, plow the growth under about July 1, and resow corn in drills four feet wide, and seed with rye; would this plan be as enriching to the soil as though he sowed the corn broadcast and proceeded as before using a "flat" of barn-yard manure, costing $35, besides the expense of hauling it three miles.

ANS.—This is a case in which no risks should be run and in which it would be better to wait a year, rather than make a mistake; for no one can say positively what can be done in this case, although in other analogous cases certain results may have been reached. A safe plan would be to try 10 acres, half in one way and half in another: say five acres dressed with 600 pounds of the best (but be sure it is the best), complete manure at a cost of $10 per acre and planted to corn—sorghum might be still better as giving a heavier growth—not plowing it in until August, when the stalks will be seven feet high. The seed should be planted in rows three feet apart, and about an inch apart in the row; which will give 30 tons to plow in. The other five acres may be manured in the ordinary manner, as suggested, which with the hauling will cost over $10 per acre, and be sown in the same way as the other plot. About the middle of August, the corn may be rolled down the way the ground is to be plowed, and covered with a deep furrow, with a chain on the plow beam to draw the corn into the furrow. This will put the corn under the soil. The ground should then be rolled to compact the surface, and afterwards worked shallow with a cultivator to get a seed-bed. It may then be sown to rye and Timothy. Whichever way is seen to be the best may then be followed with the remainder of the land, with better surety of success than now. If the plan fails, the rye should be cut for straw, and will pay a good profit on the cost. The plan may then be modified in some way which will be better discovered then than now. Success would be more likely if the land was treated to 25 or 30 bushels of lime when seeded to rye. If the plan succeeds, as it should do, and probably would, the land should give fair crops of hay with the help of moderate fertilizing occasionally.

Draining a Flat.

A. M., Bay City, Mich., is engaged in reclaiming a large tract of land in the Saginaw marshes by diking and pumping the water from the dredge ditch. There is but a slight fall to the dredge ditch into which the small ditches lead. The surface between these latter is so flat that the water from heavy rains remains and injures the crop. He wishes to get the whole area under Timothy without the expense of tile-draining. The soil is rich, from one to two feet deep; then comes plaster clay or marl. Having heard of the "mole" plow, which leaves a hole in the ground for drainage, after it has been drawn under the surface, he asks whether its use on his land would be effective under the above conditions.

ANS.—This is a case in which the land should be plowed in "twice gathered" ridges. This is done by first laying out "lands" 44 feet wide in the following manner:—First open a furrow in the center of the "land." Then plow this shut with a deep furrow on each side, throwing the earth as high as possible. Then plow on each side to this, making up the ridge 44 feet wide. Plow the whole this way. Then harrow along the ridges and when the ground has settled, begin again in the center of each land and throw up a back furrow again and plow to it on each side; but as the outside of the lands are reached the furrows should be made flatter so as to slope down to the hollows gradually. Then harrow over and over again until the ridges are made even and smooth with the tops two feet higher than the centers of the open furrows. These may be cleaned out with a double-mold-board plow and a round-pointed shovel, so as to make good channels for the water, and have them deeper at the lower end. The ditches may be made so wide and of such a gradual slope, that a mower may be driven across them without difficulty. If at any future time it is desirable to lay tile drains, the work is half done, and the ditches may be dug in these open furrows, mostly with a plow. But for grass these surface drains will doubtless be better than tile drains. If the land is ever tile-drained, it may be left as it is or plowed back again in "single gathered" ridges, which will bring it nearly to a level again or make only slight depressions over the drains, which will be useful. The mole plow is only a make-shift, and very unsatisfactory for such a use as this.

Roses at an English House.

M. W.-F., Bryn Mawr, Pa., says:—In a late number of Lippincott's Magazine—August, I think—Rose Kingsley, the daughter of the late Canon Kingsley, in writing of an English home, tells of a yellow briar rose that is said to have been brought from Damascus, a hundred years ago. She says it is very hardy, as are all of its numerous progeny; that it is sweet-scented beyond the telling, and very beautiful. It remains in bloom for three weeks. She herself was in the habit every year, when these roses were in bloom at Eversley Rectory, of putting in every room a plate of them, with a border of ferns and large black velvety pansies dotted among the roses. These plates of ferns, yellow roses and dark pansies have often danced before my eyes since reading about them, and if ever a woman was "crazy" for a new bonnet, I am "that daft" for that kind of a yellow rose. I have a yellow rose, but it is not particularly fragrant, and its growth is stunted rather than otherwise. It is a briar rose, too; but I can't imagine it bearing its thousands of blossoms like that one at the English house. Can you tell me if that rose has been introduced into this country, and under what name?

ANS.—It is Eglantina lutea, yellow, an immense bloomer, the best of all the yellow roses. It is sweet-scented, but not so sweet-scented as that our correspondent describes. Loudon calls it a native of Germany and the South of France. It cannot be a regular Damask Rose, for roses of that kind are neither briar nor yellow.

Miscellaneous.

E. W. K., Glens Falls, N. Y., asks whether a farmer can make a living in Southwestern Iowa, on a farm of 40 or 50 acres, without raising hogs and cattle for market. He has been told that no farmers live in Iowa without raising cattle and hogs for sale.

ANS.—There is nothing we know of in the soil, climate or location of Southwestern Iowa which would prevent a man on 40 or 50 acres from making a living, as well as in Illinois or any other State in the West. In fact, not one farmer in twenty begins with any more stock than that of his team—a pair of horses—a cow or two and as many pigs and a few fowls. Wheat and flax are his best crops, because they are easiest and quickest made; then follows corn, and with corn, oats, potatoes, vegetables, etc., etc. Finally, when he has got "well heeled," as the phrase goes, as a grain farmer, he then naturally drifts into stock.

L. D. G., Stedman, N. Y., says that a tree agent has been selling what he claimed to be Russian apples in that section, and he asks, 1, whether any Russian apples are raised in this country, and if so, whether they are good; 2, are there any blight-proof pears.

ANS.—There are many Russian apples cultivated in this country, and some of them are of first value. To many of these the RURAL NEW-YORKER has given special attention dur the past 18 months. The best of them are sold by nurserymen at the usual price. 2, Not that we know of. Some kinds are more liable to blight than others. Kieffer's Hybrid is said by some to be "blight-proof," but we know of instances in which it has blighted.

J. W. L., Smith's Grove, Ky., asks which is the cheaper—wheat bran at 10 cents per bushel or corn at 50 cents.

ANS.—We suppose our friend means for stock feeding purposes; if so, a reference to the table of the relative value of feeding stuffs, under the heading "The Dairy Cow," on page 520, of our issue of August 14 will show him that while 100 pounds of wheat bran are worth $1.58 100 pounds of Southern corn are worth only $1.67. It will readily be seen, therefore, that at the above prices the wheat bran is the cheaper.

E. C. P., Newport, Oregon, asks, 1, where can he obtain seeds of the Irish Juniper—none of the catalogues mentions them; 2, how should juniper seeds be treated.

ANS.—1. The so-called Irish Juniper is merely a variety of the common Juniper and does not come true from seeds. 2, Sow the seeds in mellow, sandy loam. Keep it moist, though never wet. Shade with lath covers, the laths nailed two inches apart. The seeds may be sown in the Fall. If in the Spring they should be placed in sand in boxes and buried over winter.

J. G. A., Baltimore, Md., says that the Laurel-leaved Willow he received from the RURAL is growing nicely and has three shoots, and he asks whether it would be better to cut off two shoots and let the third grow, or to trim all three back.

ANS.—Just as you prefer—it is purely a matter of taste. The tree will bear cutting back to any extent. We prefer to have them branch low. A long, naked stem impairs the beauty of this handsome little tree.

H. L. K., Republican City, Neb., asks 1, how to treat a Chinese Primrose, whose leaves die so that there are only two or three leaves on a dead-looking stalk, and a heliotrope that does not blossom.

ANS.—Too much water and imperfect drainage are probably the trouble. Were you to tell us of the treatment you have given, we could advise you more definitely.

That furred tongue, bad tasting mouth and miserable feeling, says you need Hop Bitters.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, SEPT. 4, 1880.

We have made several statements against Dr. John M. Bailey, of Bellerica, Mass., of a very grave nature. If true, he is a man unworthy of trust. If there is even a possibility that we may be wrong, Dr. Bailey should have the benefit of the doubt. We therefore invite him to controvert our statements if he can, and ask our readers meantime to suspend their judgment. A marked copy of this will be sent to Dr. Bailey.

PERCHERONS FOR SMALL FARMS.—The West appears to be taking all the Percheron horses. But it seems to us that they are just what the 10 to 50-acre farmers of the East want for a horse of all work. A one-horse team is sufficient on a small farm, if the right kind of a horse is chosen—heavy, yet active; docile, yet spirited; a good walker, yet able to trot at a brisk gait; strong, well broken, willing and safe. It is easy to make just such horses of the Percherons. In fact they are all that, but the breaking, by nature. Such a single horse on a small farm is better for nearly every purpose than a pair of light horses. On a truck farm he fills the bill in every particular, except for running the horse-hoe in narrow rows; and if a second beast is needed for that use, a small mule, well trained, is better than any horse. We think a lively demand for Percherons will spring up among the small farmers. Let Percheron breeders keep this in mind in training them.

SAVE YOURSELVES WHILE YOU MAY.—The duty of getting out of debt and keeping out of debt which the RURAL has pressed upon its readers has, we have reason to believe, been acknowledged and acted upon by many of them. But still the farmers are to be counted by the hundred thousand whose financial management is exactly of the sort of the "Western river character" quoted by Mr. Chamberlain in his "Western Farming." The returns of farming have, in most parts of the country, been exceptionally large the present season. Three extra seasons have followed one another and enriched the country, though by no means always the farmer. It is more than likely that we may now have a similar succession of poor or moderate crops. Take time by the forelock, therefore, O, indebted farmer! "Agree with thine enemy quickly whilst thou art in the way with him." Every creditor appears like an enemy to the debtor who cannot pay. Buy nothing you do not need—absolutely need—while a debt remains that may trouble you if next year's crop should prove a failure. So may fearful disasters be averted, the home protected, and comfort in old age be secured. Settle up.

A FORCIBLE COMPLIMENT.

One of our friends sowed side by side a quantity of seeds of both the Early Minnesota Amber Cane, and what we call the Rural Branching Sorghum. Some time ago he reported te us that the Amber Cane was beating the Branching Sorghum all to pieces; that it averaged twice as many stalks to a seed; that it was more leafy; that it would continue to grow in a remarkable manner after being cut back; that, in short, it was not only a far better fodder plant than the Branching Sorghum, but the best fodder plant he had yet tried. We were much perplexed and a little mortified that our favorite sorghum should thus be so totally eclipsed, especially as the report came from one whose judgment and accuracy were not to be questioned. In due time the Amber Cane began to show its flower panicles, when it was at once evident that the labels of the one had been given to the other and that what he took for granted was the Early Amber was in fact the Rural Branching Sorghum.

A HAY DRIER.

A machine for drying hay has been used to some extent in England this season, and in that extra-wet climate is found to answer a good purpose. It consists of two parts, both running with wheels for the purpose of taking it on to the meadows with facility.

The first machine is a frame about 30 feet long and 12 feet wide, supporting a sheet-iron reciprocating trough, along which the grass is slowly pressed as cut, and dried by hot air. This is supplied from a furnace on another machine, the fan of which for the hot air is driven by an ordinary portable farm engine. Although still imperfect, the machine has worked quite satisfactorily. It dries about an acre of heavy grass per hour, and the extra labor required for this over ordinary sun-drying is only that of two men. In "catching" weather it would be cheaper to use the machine than to undertake to dry the grass without it.

Where the rain has destroyed so much grass after cutting, by mold and rot, the two past seasons, as in England, and, in fact, as it does this more or less every year, a hay-drier becomes an important harvesting machine there, and at times might be found very useful for us here. We recommend the matter to the attention of our mechanics. We do not think it would require so much ingenuity on their part to get up a hay-drier as to make a grain reaper and binder, although it would be something more expensive.

THE DROUGHT AND THE CORN CROP.

For some weeks back an extremely severe drought has been doing very serious damage to the corn crop in many parts of the West and Northwest. Indiana, Illinois, especially the southern districts, Wisconsin and Kansas have suffered most severely. Last year these four States produced 675,800,000 bushels of corn, and early in July, at the time of our crop reports, the prospect was unusually favorable for a still heavier crop this year. The stand then was remarkably fine while there was a large increase of acreage in Missouri and especially in Kansas. Good judges in various parts of these States now estimate that the drought will there cause a reduction of fully 30 per cent., or about 200,000,000 bushels. In Ohio, Michigan, Iowa, Kentucky and Tennessee, which last year yielded 432,000,000 bushels, showers have from time to time averted the injury to the crop, which has been constantly threatened, and it is now probable that in these States last season's aggregate yield will be obtained. The total corn crop in all the States in '79 amounted to 1,544,899,000 bushels, and deducting from this the aggregate yield of the above-named States, the entire crop of the remainder of the Union was only 437,099,000 bushels. It is hardly likely that this amount will be materially augmented this year, especially as the increase of acreage has been mainly in the Western States where the crop has been seriously injured, or checked enough to prevent an increased yield. It is likely, therefore, that the aggregate corn crop of '80, despite the early promise of an immense yield, will turn out somewhat less than that of '79, and already the rise in price of corn, both here and in Europe, portends that contingency. In the West, too, the prospect of a short crop of this indispensable cereal is already forcing on the market lean hogs and leaner cattle. The shortage in our hay crop will be all the more severely felt in the presence of a deficiency in corn, which, if abundant, would have proved a cheap and handy supplement or substitute.

HINTS TO DAIRYMEN.

THE most enterprising and successful dairymen carry on what is known as Winter dairying. Every one cannot make butter in Winter, and the majority of dairymen are compelled to do their business in the Summer season. But no one is obliged to sell his product as soon as it is made, unless it is so made that immediate sale is necessary to preserve it from deterioration. If butter is well made and well packed it may be kept for six months with perfect safety, and some experts are convinced that the best-made butter ripens and improves in flavor by keeping, because the particular essential oils which give the aroma to good butter become slowly developed when the latter is perfectly well packed and preserved from the atmosphere.

Manufacturers of goods rarely or never crowd their products on the market as soon as they are ready for sale. They watch the markets, and the selling of their goods is one of the most important parts of their business. Their profits depend in a great measure on selling at the right time and holding off at the wrong time. It should be so with the dairyman. But he cannot hold off unless his butter is so well made and packed that it may be kept over for weeks or months without injury. Our readers may find frequent suggestions in our columns from capable correspondents who are experts in dairying, and who are in no way adverse to giving the fullest instructions to other dairymen; and these suggestions will be found of much use to those who desire to avail themselves of every advantage that may help to make their business more profitable.

It is timely just now to call the attention of dairymen to the frequent practical articles on dairying which appear in our columns and which are specially applicable to the subject under consideration. Last winter we published a series of articles written by a Winter butter maker which might now be read with benefit in reference to Fall packing. Fall-trade butter, from the fresh growth of grass which is now beginning to spring, as the cool, dewy nights and seasonable showers occur, is of as choice a quality as any. The success of the dairy business depends upon excellence of product and sales made when the highest prices are current. Doubtless the mere suggestion of these points will draw mature consideration to them from our interested readers.

WHICH IS THE BEST?

THE extreme differences of opinion which exist in regard to important questions, of all kinds, are very remarkable. As regards agriculture and horticulture and the practical operations connected with these, these differences are as wide as in any other questions. One asks which is the best method, the best kind or variety of seed, of plant, root, animal or implement, and one says this and another that; and to ask such a question brings out a mass of contradictory opinion, which is disheartening to one who seeks for information with the hope of profiting by it. There is abundance of opinion but scarcity of evidence in regard to most of the questions which come up for solution. A farmers' club spends two hours discussing some matter in dispute, and at the end the men separate, each having the same opinions which he had before. One asks for information and he gets a mass of conflicting statements of what has been heard or perhaps may have been done under widely differing circumstances and which are therefore perfectly uncertain and useless as specific evidence. Or one writes to his favorite paper and propounds some problem, and he is either answered in a careful or cautious way that "it is probable so and so may be thus and thus," or some kind correspondents give their contradictory views in a way that is tantalizing and bewildering.

Truly facts are very scarce, because few seem to take pains to definitely fix the preliminaries of any observation or accurately count, measure or weigh the results. You ask a farmer for some fact in regard to some interesting occurrence, such as a fine yield of wheat, or how he made his premium butter, and he can rarely say how many acres there are in the field, how much seed or manure he had used, how much the crop cost per bushel, and if it was profitable or not; or how much milk was set for a pound of butter, or tell anything in regard to it with certainty.

It is too much to expect unanimity, even in regard to so simple a matter as the best kind of wheat or the best dairy cow. In truth, there is no one thing that is best under all circumstances for any use; but there are conditions and circumstances which are typical of a large number of cases, in which the similarity of requirements is such as to bring all of them within a certain rule, and yet for want of exact knowledge, there is no precise information to guide an inquirer in regard to anything. We might here pertinently remark that this applies very forcibly to the proposed Experiment Station in the State of New York, or indeed to any other. There is no one place that is the best to carry on a set of experiments. There should, in fact, in any one State, be duplicate or triplicate sets of experiments made on differing soils and in differing localities. Experiments repeated strictly in the western, central and eastern parts of any State under different circumstances would be far more vauable and useful than would one only made in one locality.

BREVITIES.

FARMERS—now is your time to be happy, if ever. Wear smiling faces at the fair and let everybody see that you are in fact, as you ought to be, the most contented class of people on the earth.

WE are glad to learn through English journals that further and very decided improvements have been made in Sweet Williams, always to our view one of the prettiest of our garden herbaceous ornaments.

WE learn that C. A. Dana last Fall spent about three thousand dollars in the construction of a cave for the cultivation of mushrooms. He has employed a professional mushroom grower to take charge of it and naturally anticipates, it may be supposed, after so liberal a provision, that the results will prove compensatory.

MEMBERS of the American Association for the Advancement of Science now in session at Boston, have taken the initiatory steps for the establishment of a Scientific Agricultural Association of scientific men. Prof. W. J. Beale, of Mich., was elected President, and Dr. E. Lewis Sturtevant, Secretary. The meetings will be at the same time and place as those of the American Association of Science.

A WELL-KNOWN seedsman of this country—we may be pardoned for omitting his name—sent seeds of "A new Chinese Fodder Plant" to the Rural Farm. Much interested in all new plants of this character, we planted and labeled them with unusual care. From germination until the formation of seed heads, the grass bore a familiar look which is now identified as that of an old friend—Panicum miliaceum millet.

THE annual importation of some $25,000,000 in flax and flax goods would naturally lead to the inquiry as to what is being done in this country to supply that demand at home. The crop of flaxseed increases each year, and so does the importation of flax. Is there no profitable medium place in flax growing where the seed and the fiber may both be made a more profitable business than seed-growing alone?

THE Governor of this State has informed the Board of Control of the New York Experiment Station that the appropriation of $20,000 will not be available until May next, and a committee has been appointed to examine affairs and recommend what should be done. No Chemist or Director has been appointed. The Board of Control will keep the management and employ such chemist and others under their charge as may be necessary.

THE remarkable statement that the receipts from customs for the year ending June 30, 1880, are $50,000,000 greater than for the year ending June 30, 1879, leads to the consideration of the fact that the United States must have sent away to the value of $200,000,000 more for the purchase of foreign goods than during the previous year. This should stimulate capital and labor to discover these needs and to enter new ventures in an effort to supply this demand.

FLORIDA is an illustration of what can be done to aid the prosperity of a State where a systematic effort is made for that purpose. Soon after the close of the war special effort was made to advertise the advantages of soil, climate and products of that State, and the result is an increase of 60 per cent. in the population in ten years. There is no State or locality in the Union but what has some interest or advantage for some purpose, and a carefully prepared description of such advantages will be sure to bring its returns.

AT the late meeting of the American Association for the Advancement of Science at Boston an organization of agricultural chemists was perfected. Dr. C. A. Goessmann was elected president, and Dr. A. Ledoux, secretary, Drs. Jonson, Atwater, Caldwell, Shepherd and another were appointed a committee to revise by experiment and otherwise the methods now employed in America and Europe in the analysis of commercial fertilizers, the report to be published and probably to form a standard for American chemists in these analyses.

EARLY in the season, our most promising field of wheat was Silver Chaff. A heavy crop of clover aftermath was plowed under. Three loads of hog manure were spread upon the plot (half an acre) and 100 pounds of lime superphosphate drilled in with the seed (Sep. 20) three-quarters of a bushel being used. It was harrowed twice and after the seed was sown, rolled. Up to the time that the Army Worm appeared, we had never seen a handsomer piece of wheat. This was one of our plots—as already noted—nearly destroyed by this pest. The yield could not have been over five or six bushels.

FROM our own experience we advise farmers to sow wheat for this latitude about Sep. 15. It has been shown by many experiments that drilling in the seed will produce a heavier yield than broadcasting. Drill in not over one and a-half bushel per acre and bone flour at the rate of 250 lbs per acre. Roll the field only when the surface soil is dry, whether it be sandy or clayey. A *thorough* preparation of the soil is—more than the amount of seed sown per acre—that which determines the yield. We should be gratified if those of our readers who have raised unusually large crops of wheat would write us as to their experience in the above particulars.

SALE OF OXFORD DOWN RAMS.—Mr. John Treadwell, of Wichendon, England, had a sale of 50 of them on the 4th of August. Notwithstanding the low state of the sheep interest in all breeds at present throughout Great Britain, these Oxford Down rams brought mostly a high price—$100 to $200 each of our money. The first 20 out of the 50, averaged nearly $90 each. We observe that Mr. Cooper, of Coopersburg, Penn., purchased two or three rams at 20 and 32 guineas—($150 and $160). We have no doubt this will be a good thing for him, as Oxford Downs are destined to become as popular soon in America, as they now are in England. It will unquestionably be one of the best and most profitable sorts of sheep for us to breed for exportation.

Literary Miscellany.

GOOD-BYE, SWEET DAY.

GOOD-BYE, sweet day, good-bye!
I have so loved thee, but I cannot hold thee;
Departing like a dream, the shadows fold thee:
Slowly thy perfect beauty fades away;
Good-bye, sweet day!

Good-bye, sweet day, good-bye!
Dear were thy golden hours of tranquil splendor,
Sadly thou yieldest to the evening tender,
Who wert so fair from thy first morning ray!
Good-bye, sweet day!

Good-bye, sweet day, good-bye! [glances.
Thy glow and charm, thy smiles and tones and
Vanish at last, and solemn night advances.
Ah! couldst thou yet a little longer stay!
Good-bye, sweet day!

Good-bye, sweet day, good-bye!
All thy rich gifts my grateful heart remembers,
The while I watch thy sunset's smoldering embers
Die in the west beneath the twilight gray
Good-bye, sweet day!

A NARROW ESCAPE.

"THERE, that'll do now, Miss Gertie, dear, you look just lovely."

Poor old nurse, according to her, I was always lovely. Whether arrayed in silks or cottons, ball-dress or morning-gown, her verdict respecting me remained the same.

As I surveyed myself in the glass I felt a conscious blush rising to my face, I wanted to look my very best to night, and I knew that my white dress and pearl ornaments became me well.

"Give me a kiss, nursie," I cried, "and then go and get ready while I show myself to papa. How do I do, papa?" I demanded, bursting upon him in all the splendor of my attire.

"Eh, my little girl," he said, looking up from the book he was reading, "are you going now?"

"Yes; I promised to be the first arrival, you know; and, please, I want your candid opinion on my appearance. Nurse thinks I look lovely."

"I am afraid nurse is a partial critic," he returned with a fond smile. "You look very nice indeed, darling. You are growing wonderfully like your mother."

I knew that this was the highest praise he could give me, and forgetful alike of my dignity and my extensive train, I ran to him and clasped my arms round his neck.

"You dear old papa! You're sure you don't mind my leaving you—quite sure? And you won't feel lonely without me, will you?"

"No, my child—no.

As I drove along with nurse in her prim black bonnet seated opposite to me, my heart beat high with nervous anticipation. I was going to my first party; for though I was eighteen, papa and I had lived such retired lives that till lately I had known nothing of the gaieties usual to girls of my age. Six months previously, however, the Mortons, some old friends of my father's had settled in the neighborhood, and at their house I had begun to appear in society. Already on the strength of a few musical evenings and a garden-party or two, I felt myself quite a dissipated person.

When we reached Holme Lodge, the large, comfortable, old country mansion was ablaze with light, and from the open door streamed an inviting flood of warmth and brilliance.

In the hall I was seized upon by Loule and Lottie Morton, the twin sisters.

"Come upstairs to our room," cried Lottie; "we shall have time for a chat before the people arrive."

The sitting-room, specially appropriated to the girls' use, was a pretty, cosy apartment. A splendid wood fire was burning on the tiled hearth, and near by a little table was set forth with a dainty repast of coffee and delicious cakes.

After we had examined and commented on each other's costumes, Loule began filling our cups just as a young lady entered the room.

She was a friend staying on a visit—Isabella Saloni by name, and by birth half Italian and half English.

She looked remarkably well, in a dress of heavy saffron-tinted brocade, and necklace, ear-rings, and bracelets of dull gold, and as I gazed at her I comprehended how rarely lovely she was.

I was engaged to Rupert Morton for the first waltz; but we had only taken a couple of turns round the room when he whispered:

"Do you particularly wish to finish this dance? If not, will you come into the conservatory? It is cool and pleasant there."

I was about to make some laughing rejoinder, but a look in his gray eyes stopped me, and I merely bowed assent.

"Gertrude," he said, softly, as we stood by a marble basin wherein a tiny fountain sent up a sparkling cascade of silvery drops, "do you guess why I asked you to come here?"

I glanced up at him saucily.

"Certainly, because it is so cool and pleasant."

"Ah! that was only the pretext, the excuse. Surely you can guess my real reason, darling. You know I love you, do you not?

I strove to cover my burning cheeks with my hands; but he gently removed them, and held them in his own as he bent his head to the level of my downcast eyes.

"Have you not a word to say to me? Can you not give me one word of hope?"

I could not at first speak, but he read his answer in my silence.

"Rupert," I murmured presently, raising my head from its resting place on his shoulder, "do you know I—I thought—I—I was afraid that you liked Miss Saloni."

"You were indeed mistaken. No man could help admiring her; but believe me, beyond admiration I have never given her a thought."

The rest of the evening sped swiftly by. If I had been happy before, I was ten times happier now. I danced every dance, and at supper Rupert contrived to secure a secluded corner, where he detained me so long that I mortally offended one partner who sought me high and low in vain.

I was to remain at Holme Lodge, and go home the next day, nurse having brought everything requisite for my stay, and placed ready before she returned.

Having exchanged my ball-dress for a comfortable dressing-gown, and my satin shoes for fur-lined slippers, I sat by the fire in my bed-room, dreaming bright dreams, and weaving fairy fancies. I loved and was beloved. Was not that the hight of human bliss? Could any other joy compare with it? Truly is it written:

> "There's nothing half so sweet in life,
> As love's young dream,"

It was long ere I got into bed, but once there I fell into a deep slumber, and neither memories of the past nor plans for the future disturbed it.

Suddenly I awoke—awoke with a full sure consciousness of the presence of some one or something terrible in the room. Who or what it was I could not tell, and I dared not attempt to find out. I lay with my face turned to the wall, every limb stiff and still, and the blood in my veins curdling with fear.

At last an icy finger touched me; and, as though under some mesmeric influence, I slowly moved my head.

The fire had died out, but a night-lamp was dimly burning, and by its light I saw—I saw a loosely-robed figure, with a cloud of raven hair falling almost to its knees; luridly glowing eyes, set in a deathly pallid face: and in one upraised hand a gleaming stiletto—jewelled handled and finely pointed.

I could utter no cry; I could make no movement. I remained spellbound and dumb, my eyeballs staring and my lips blanching, knowing that I was at the mercy of a mad woman, and recognizing in that mad woman Isabella Saloni.

Again she touched me; and, though I shuddered, I could not draw away.

"You sleep soundly, she said, "but you have awaked at last. The sleep of death is the soundest of all sleeps, for there is no awakening from it! And so he told you he loved you—you, not me! What do you know of love? What does he know of love? It is I who love—I—I—I!" and her voice rose shrill and high. "I am going to kill you!" she continued, after a moment's pause. "He cannot love you then. He will forget you, and it will be my turn."

But the spell was broken. With a piercing, echoing cry for help, I flung aside the bed-clothing and sprang on to the floor.

There came a sharp, fierce blow, an agonizing pain, and then darkness, oblivion.

It was twilight when I came to my senses. The curtains were drawn, and a bright fire crackled cheerfully in the grate.

Vaguely wondering as to what had happened, I attempted to sit up, but the only effect of the exertion was a low moan of anguish.

A gentle voice addressed me soothingly, and Mrs. Morton leaned over me, and, slipping her arm under the pillow, lifted me up, and gave me some cooling beverage to drink. I fell asleep directly, and when I awoke again gray day's light was creeping in at the window, and nurse was sitting by my side.

"Thank Heaven!" she ejaculated, fervently, as I feebly raised my hand. "Ah! but you're better now, my lamb."

"Have I been ill?" I whispered.

"A little, dearie," she answered, tenderly stroking my hair.

"But—but what was it? Why am I not at home?"

"Hush! my pretty. You mustn't talk any more now. Lie still, and another time you shall hear all about it."

Ah, me! What weary days, what weary weeks, those were that I had to lie still. Waking and sleeping, I was haunted by half-delirious visions of that dreadful night. I could not bear to be left alone for even a few minutes. A flitting shadow in the corner, a fold of drapery, would nearly send me into hysterics.

At last when the birds were blythely carolling a welcome to the Spring, and trees and hedgerows were bursting into leaf, I was carried from my bed to a sofa in the adjoining room, and from that time recovery was more rapid.

Harvest was just over when Rupert and I were quietly married at the village church. The Winter following we spent abroad. Papa joining us at Nice in October, and accompanying us on the remainder of our travels.

Isabella Saloni is in a private asylum near London. Insanity, it appeared on inquiry, was hereditary in her family, though the fact had always been kept as secret as possible. Poor, poor girl! I only think of her now with intense pity and compassion.

THE LEANING TOWER OF PISA.

THE city of Pisa in Tuscany is one of the most interesting places in Central Italy. The city is built on the Arno, which divides it into two nearly equal parts. The cathedral is a very handsome structure, and with its attendant buildings the Baptistry, and the Campo Santo, or cemetery, afford examples of some of the finest specimens of early Gothic architecture. But most remarkable of all, perhaps, is the belfry of the cathedral, or, as it is better known, the Leaning Tower of Pisa. It is to the existence of the structure named that the city of Pisa chiefly owes its fame, and the leaning tower was originally placed in the category of the "Seven Wonders of the World," and reaches an elevation of about 150 feet. This singular structure stands in an enclosed square along with the principal cathedral of Pisa, and within a few feet of that building, as a belfry, for which it was originally erected. At the period in which the cathedral was built, viz., the year 1150, it was customary to erect the belfries apart from churches. Of this peculiarity of early ecclesiastical architecture there are many instances to be found on the continent of Europe, especially in Italy. But the tower to which we call attention, irrespective of its being, in connection with the cathedral, a noble specimen of mediæval architecture, has always rendered the town of Pisa famous from the peculiarity of its inclining at an angle which, to a stranger passing under it, would seem to threaten its instant fall. Indeed, there is considerable difference of opinion amongst scientific observers as to whether the structure depends for its stability on the well-known law of gravity having been complied with in its erection, or upon the great tenacity of its materials.

It is described as "consisting of eight circular stories, of white marble, ornamented with rows of columns and gradually narrowing in width from top to bottom.

But if opinions are divided as to the cause of the stability of the structure, still more are they divided as to the cause of its inclination from the vertical line. Some attribute this inclination to the subsidence of the foundation, or a sinking of the earth upon which it rests; while others contend that the tower was built expressly with its present inclination as a specimen of the skill of the architect by whom the structure was designed. Upon this question we cannot venture to more than hazard a conjecture; for our part we should be more inclined to adopt the latter hypothesis were the instances of such designs on the part of mediæval architects more numerous than they are. But, in view of the comparative variety of such constructions, it seems to us to be traveling out of one's way to attempt to account for so singularly an apparent violation of the laws of physics, as that presented by the leaning tower of Pisa, upon the assumption of a set purpose on the part of the architect. We must, however, in candor, admit that the balance of opinion is rather against our view than otherwise.

* * * * * * *

A scientific observer, remarks that the name of "this Leaning Tower" does not convey a true notion of the form of the building. It is, he remarks in fact, a "twisted" tower, there being an irregular curvature in the building, But he conjectures that this "twist" was due to the subsidence of the foundation during the erection, and an attempt on the part of the architect to "right" the building as the work proceeded.

In conclusion it may interest some of our readers to learn that "it was from the summit of this celebrated leaning tower of Pisa that Galileo made, in the seventeenth century, a series of observations, from which he deduced the principles of the gravitation of the earth."—Sidney Journal.

VENTILATION.

SUMMER heat, outdoor life, and open windows are natural ventilators, and need no hints and no comment.

Close-shut windows, artificially-heated rooms, winter cold, these are the conditions under which ventilation is neglected, being too often a penalty rather than a desideratum.

"Bad Ventilation v. Draughts" gives in three words the popular information on the subject. The question to decide is—which is the less objectionable of the two evils? and it is decided simply upon the grounds of personal idiosyncrasy and personal taste.

How should it be otherwise? One man suffers from continual twinges of rheumatism? Can any deprivation of this intangible oxygen be to him so obnoxious as a draft of cold air laden with rheumatic pains? That man's neighbor is a robust sportsman who considers all aches and pains with the half-contemptuous scepticism commonly bestowed by ignorance upon the unknown. Can any pain be worse, he asks, than the living death of a stuffy room? It is known as a scientific fact, that persons in a depressed state of health bear deprivation from oxygen far better than the strong and vigorous, and that old people seem quite at ease in a room that to their grandchildren is insupportably hot and close.

Drafts are not ventilation, though, under popular guidance, ventilation generally ends in drafts. There is nothing incompatible between a close room and a current of air. Bad ventilation is an oscillation between the two. A fast-closed room, with no apparatus for the inlet or outlet of air, was, some years back, a very common form of class-room for children. Towards the end of a couple of hours the children's wits deserted them, and the teacher's temper followed; the room was hot and close, though its inhabitants were flushed and chilly; then came half an hour's recreation, and for that half hour, whether in the presence or absence of the children, all doors and windows were flung open wide, and the room was falsely said to be "ventilated," ready for another two hours' suffocation in the afternoon. Whatever this may be, it is not ventilation.

Popular theories of ventilation are based upon a misapprehension that "hot air ascends." But, to make use of a common illustration, it does so only in the same way that water in a pail ascends if a lump of lead be dropped into it. The lead, being heavier than the water, gravitates towards the surface of the earth, or the bottom of the pail, and displaces its own bulk of water. Just so the force of gravitation draws the cold air of a room down to the floor and keeps it there, the results being a draft on the floor, though the room may be close, and cold feet, though the atmosphere may be overheated.

To make an aperture near the ceiling where the hot air should escape, and to make another near the floor where cold air should enter, was not so very long ago the received method of ventilating a room. "Should escape" expresses well the fact. Air, cold or hot, has laws of its own, and obstinately refuses to follow the course of arrows, that guide it so easily (on paper, at least) through all manner of ingenious ventilators. The next step was to make two apertures near the ceiling—one for exit, one for inlet. It was a step in advance. Both commonly served as inlet ventilators, spite of their labels. In this way plenty of fresh air entered the room, though in a sufficiently unpleasant manner. Air behaves much as water would do in a like situation. Given a hole in the wall, and outside a volume of water under pressure, one would look for a water-spout striking on the head of any person who happened to be sitting beneath. We do not look for an air-spout, and, when it comes, we are surprised at the down draught from the ventilator.

An open window is the simplest of all ventilators. It almost invariably serves for inlet, be it said, whether it be opened at top or bottom. Incapable of subdivision, how shall the current be directed upwards? Open the window at the bottom (a sash window understood), and fit into the frame a piece of wood about six inches wide. Then shut the window down on the wood. Air enters between the upper and lower sash, and the current is directed upwards by the frame of the lower sash that projects over the upper. Or you can procure a board about 18 inches deep, fitting close to the wall at the bottom of the window, sloping forwards into the room. A triangular piece of wood fits in at the sides, and a sort of shaft is made, behind which the window can be opened without fear of draught. It is rather unsightly for a dwelling room, but may be serviceable on a landing or staircase. Again, you can open the window at the top, and nail over the opening a piece of perforated zinc some inches deep. That is a contrivance for subdividing the current, and it materially diminishes the draught. Its advantages are that the zinc is inexpensive and a fixture, so that it cannot get out of order. The plan may wisely be tried in those modest households where the sleeping rooms are constantly overcrowded.

Sometimes, especially in the country, a brick may be removed from the wall, and piece of wood sloping forward—a frame, in fact, similar to that described for the window—may be neatly concealed by a picture or engraving. A wooden lid shuts the shafts. A contrivance for ventilation, only visible on rare occasions, is to cut in the lower part of the frame of a sash window three or four oblong holes, two or three inches long and as wide as the window frame permits. They can be closed at will if a small piece of tin be fitted as a cover to each. Nothing but bitter cold will make this small opening unbearable. This or any other opening can be filled with cotton wool. The wool must be lightly pulled, and renewed occasionally. A question of practical import is often asked, How can one know when the air of a room is too impure to breathe? The answer is simple. Common observation shows that all our senses were given for some practical end, and it would be hard to believe that the sense of smell is intended only for a mild pleasure, as when we smell a rose or a bunch of violets. Fortunately, no such belief is required of us. No chemical experiment can detect the impurity of air more certainly or more exactly than it is detected by the olfactory nerves, though of course this sense, like any other, can be cultivated or neglected. Come straight out of the fresh air into the room you wish to test, and you will not fail to discover the fact if ventilation be needed. There is no place for doubt—the room smells close, or it does not. Scientific men could not alter the fact or suggest for a close room any other remedy than a supply of fresh air.

MAGAZINES FOR SEPTEMBER.

THE ATLANTIC MONTHLY.—Contents: The Stillwater Tragedy, XXIII.—XXVIII.; Twoscore and Ten; Sir Walter Scott; Political Responsibility of the Individual; The Perpetuity of Song; Au Serieux; Unaware; Intimate Life of a Noble German Family, Part I.; Women in Organizations; Each Side the Bridge—A Dutch Painting; Reminiscences of Washington—VI.; Mrs. McWilliams and the Lightning; West Wind; Oxford and Cambridge; Progress of the Presidential Canvass; Such Stuff as Dreams are Made of; Music; Recent American Fiction; Goldwin Smith's Cowper; Mr. White's Books; The Contributors' Club.

THE GENIUS OF SCOTT.—In novel-writing there are many things he has done well which other men have done better, but no one maker of fiction has combined so many rare qualities as he. There are always plenty of men cleverer than he, but he has no rival in a sort of majestic abundance of power. In fact, his prose is epic. For that sort of composition there is no need of precise and superfluous detail; what is required is a sort of grandeur and massive strength, such as Scott alone has possessed in modern times. The form that he chose, in accordance with the taste of the day—for to sit down to compose an epic poem would have been like sacrificing a bull to Jupiter—is one that other dexterous craftsmen have worked in a more intricate fashion; so that his novels bear the same relation to modern stories that one of Nelson's 72-gun frigates bears to a mastless, steel-clad ram. Hence it is that some people are inclined to look upon him as old-fashioned; but there are certain things that never go out of fashion, even if they undergo seasons of neglect, or even if they are weighed down by acknowledged deficiencies. It is easy to learn that the Middle Ages were something very different from what Scott thought them to be, and that there is inexactness in his accounts of the crusades and the crusaders, but it will be a long time before the completest collection of details will bring before us those remote times with anything like the vividness of Scott's portrayal. The siege of Troy was doubtless something very unlike Homer's account of it, but what Hector and Helen and Achilles have done for Homer, Scott's characters will do to keep his fame fresh when all the

stucco and paste of his ornamentation have fallen away.

Scott, it must be remembered, does not belong to readers of English alone. He and Byron are the only English writers of this century—and Shakespeare is the only other—whose fame has spread over the whole of Europe, and Scott's influence over his contemporaries is really beyond estimation.

The invention of English writers has gone back to its customary channels, those of domestic incident and inartistic detail, but readers still possess the faculty of imagination, and those who care more for the free air of romance than for narrow precision still return to him as the last purely imaginative writer of English fiction.—Thomas Sergeant Perry in September Atlantic.

HARPER'S MAGAZINE:—Contents: The American Graces; Fish and Men in the Maine Islands; The Family of George III; By-paths in the Mountains; The Seven Sleepers' Paradise beside the Loire; Amid the Grasses. A Poem; Squatter-life in New York; Motherhood. A Poem; White Wings. A Yachting Romance; Amandar. A Story; Washington Square. A Novel; The Red-horse Tavern; A Midsummer-night's Adventure. Indian and Negro; Editors's Easy Chair; Editor's Literary Record; Editors' Historical Record; Political Intelligence; Disasters; Obituary.

A MUCH-WRITTEN-ABOUT ROYAL FAMILY.—Thackeray, in his well-known lectures, has brought before us as in panoramic procession the courts of the four Georges. "Burney," whom he quotes in describing the household of the third George, has much to tell us of its members. A more highly favored observer of the same royal family was the aged Mrs. Delany, who, while living with the Duchess of Portland at Bulstrode, had frequent opportunities of intercourse with the King and Queen, and whose home during the latter years of her life was at Windsor, where she had been established by royal invitation. Through these sources—Mrs. Delany's recollections being supplemented by those of later generations in her own family—are we principally enabled to look into this royal interior. Here we learn something of the home life of George III., the good husband and father, the unwise King, who was as a thorn in the side of our forefathers, his transatlantic subjects, until they worked out their own deliverance. Of Queen Charlotte we hear much. Miss Burney, as we know, held the drearily honorable post of Keeper of the Queen's Robes; and Macaulay, in his essay on Madame D'Arblay, dwells indignantly on the hardships of her position. In truth, the "sweet Queen," so considerate for her venerable friend Mrs Delany, was very much the *belle dame sans merci* with her dependents. Queen Charlotte preserved her royal graciousness of manner, however, and appeared regally unconscious of the sacrifices she required from her ladies. The case was somewhat the same with his Majesty and the equerries; and the wearied attendants compared miseries and condoled with one another over their treadmill existence.

But the chiefest victim, the authoress of Evelina, who is a very lamb for patience and amiability, is meanwhile taking her unconscious revenge. Did they not know there was "a chiel amang them takin' notes?" She keeps a diary; she flies to its pages as a relief from unhappiness and *ennui;* and though too loyal and Toryish to breath a word of direct reproach, the simple narrative of facts is all that is needed. But Miss Burney's reverence for royalty makes her eager to excuse and explain away the Queen's selfishness, and her attitude of adoration toward the whole family is truly edifying.—K. M. Rowland, in Harper's Magazine for September.

SCRIBNER'S.—This number contains four or more contributions to history; all, are in a readable and popular vein. "Eighteen Years Alone," the first account, in permament form, of an Indian woman who lived alone on one of the Santa Barbara Islands from 1835 to 1853." The loss of the Oneida," a description of the collision between this vessel and the English steam-ship Bombay. Lieutenant T. A. Lyons, U. S. N., the author of the article,—which is the first correct and popular history of the disaster,—was in the vicinity at the time of the accident, and assisted in the official investigation at Yokohama." "Thomas Paine and the French Revolution," by Hon. E. B. Washburne, our late Minister to France. "Over the Balkans with Gourko" is an account of General Gourko's campaign during the late Russo-Turkish war, from Plevna over the Balkans to Constantinople, by Lieutenant Francis V. Green, U. S. A., who was sent abroad by the United States Government as military *attache* to the American Embassy at St. Petersburg. Eugene Schuyler continues his great historical serial, "Peter the Great." Somewhat of an historical nature also is the life of "Jean Francois Millet—Peasant and Painter," by Alfred Sensier, with an introduction by R. W. G., and reproductions of his most noted works.

ST. NICHOLAS is a thorough sea-side and out-of-doors number.

Miss Alcott's serial, "Jack and Jill," takes its young people through fun and mishap beside the sea, and Mr. Noah Brooks's continued story, "The Fairport Nine," describes a night attack by the "White Bears" upon the camp of the "Fairports."

Of the complete short stories, "A Day off Barnegat," illustrated by W. L. Sheppard, narrates how cedar-logs are mined out of sunken marshes; "Rell's Runaway," illustrated by E. B. Bensell; "How Tom Cole Carried out his Plan," paraphrases an incident in the life of William Morris Hunt; "The Lesson of Walnut Creek," with two pictures, shows the advantage of girls knowing how to swim; "The New Engineer of the Valley Railroad," illustrated by H. Faber, gives an account of a rash monkey's exploit on an unattended locomotive; and "The Naughtiest Day of my Life," with two pictures by Robert Lewis, is the first half of a characteristic story by H. H.

Mr. Norton's fully illustrated article about "Small Boats: How to Rig and Sail Them," and Mr. Barnard's "Talk about the Bicycle," with its nine pictures, are of interest to boys.

There are also in this number a description of the "Girls' Swimming-Bath," with several pictures, by Miss C. A. Northam: "Chased by a Hoop-Snake," one of "The Major's Big-talk Stories," with a funny illustration by Miss S. A. Rankin; several comical pictures, a number of poems, a Young Contributor's story ("The Bicycle Boys"), two pages of large type and pictures for very little readers, and the usual departments, "Jack-in-the-Pulpit," "Letter-Box," and Riddle-Box."

LIPPINCOTT'S MAGAZINE.—Contents: Ekoniah Scrub, Among Florida Lakes, Illustrated; Canoeing on the High Mississippi, Part II., Illustrated; Adam and Eve, a novel; A Villeggiatura in Asisi; Horse-Racing in France, Part I., Illustrated; Mrs. Pinckney's Governess; The Home of the Gentians; Newport a Hundred Years Ago; Studies in the Slums, Diet and Its Doings; Delectatio Piscatoria, The Upper Kennebec; The Ruin of Me (told by a Young Married Man); Short Studies in the Picturesque; Our Monthly Gossip —; Literature of the Day.

NEWPORT A HUNDRED YEARS AGO.—There is a magnetism in places which has as strong and subtle a potency as that which belongs to certain persons. Newport, Rhode Island, is not an inapt example of the class of which I speak. The wonderful mildness of the air, coupled with its exhilarating qualities; the fertility of the soil, which throws tropical vegetation over the stern realism of crag and precipice; the mixture of the wildest features of Nature with its softest and most intoxicating influences—all these anomalies, unexplained even by the proximity of the itself inexplicable Gulf Stream, combine to form a perfect and most desirable whole. Nor is this description over-colored or the off-shot of the latter-day caprice that has made of the place a fashionable resort. The very name of the State suggests that of a classic island famed for its atmosphere; and as Verrazano, writing in 1524, compares Block Island to Rhodes, it is possible that hence arose its title. Neal in 1717, and the Abbe Robin in 1771, both speak of Newport as the Paradise of New England, and endorse its Indian appellation, Aquidneck, or the Isle of Peace. Berkeley, dean of Derry, who came here in 1729 full of zealous but utopian plans of proselytism, writes of it that "the climate is warmer than Italy, and far preferable to Bermuda" (his original destination). Indeed, it is to the good man's enthusiasm for Newport that we owe his burst of poetical prophecy, "Westward the course of empire takes its way."—FRANCES PIERREPONT NORTH, in Lippincott's for September.

VARIETIES.

THE FARMER FOR THE FAIR.—A husbandman.

GOOD nature is more amiable than beauty and more agreeable than wit.

THE habit of being always employed is a great safeguard through life, as well as essential to the culture of every true virtue.

THERE is a Gaelic proverb: "If the best man's faults were written on his forehead, it would make him pull his hat over his eyes."

HE who is false to present duty breaks a thread in the loom, and will see the defect when the weaving of lifetime is unrolled.

IT is said if you sit down when assailed by a ferocious dog the beast will not touch you. But the judicious man will select as high a seat as possible—at the top of a tall tree, for example.

POLITENESS.—The fountain of true politeness is a good and generous heart. It consists less in exterior manners than in the spirit developed in conducting the true intercourse of society.

ERSKINE puzzled the wits of his acquaintance by inscribing on a tea-chest the words: "*Tu doves.*" It was some time before they found out the wit of this literal translation,—"Thou teachest."

WASTE NO TIME.—Time lost can never be regained. After allowing yourself proper time to rest, don't live an hour of your life without doing exactly what is to be done in it, and going straight through with it from beginning to end.

THE small stones which fill up the crevices have almost as much to do with the making the fair and firm wall as the great rocks: so the right and wise use of spare moments contributes not a little to the building up, in good proportion with strength, a man's mind.

WHEN you are traveling always take some stranger into your confidence, tell him how much money you have with you, where you keep it, and what you are going to do with it. If he doesn't relieve you of what you possess you'll have the satisfaction of knowing that you have at last met an honest man.

AN eccentric Englishman lately went to the top of Mount Blanc for the purpose of building a fire where none had ever been kindled. He succeeded in doing so, and on getting back to the inn at the foot of the mountain recorded his triumph in English upon the hotel register. It was achievements like this that originally made the Englishman the laughing-stock in French comedy that he is today.

WHAT YOU DO, DO WELL.—If a thing is worth doing at all, it is worth while to do it well. Yet the world is full of work badly done and half done. It is always bad policy to do work in a poor, half-hearted, and slovenly fashion. Good and honest work will always be of the greatest service, both to the serving and the served. The worker will ever find it to his best interest to work conscientiously and carefully, and to do his very best.

NOTHING gives more mental and bodily vigor than sound rest when properly obtained. Sleep is our great replenisher, and if we neglect to take it regularly in childhood, the result will be all the worse for us when we grow up. If we go to bed early, we ripen; if we sit up late, we decay; and sooner or later we contract a disease called insomnia, or sleeplessness, allowing it to be permanently fixed upon us, and then we begin to decay, even in youth. Late hours are shadows from the grave.

WORTHY OF IMITATION.—When Philip Henry, the father of the commentator, sought the hand of the only daughter of Mrs. Mathew in marriage, an objection was made by her father, who admitted that he was a gentleman, scholar, and an excellent preacher, but he was a stranger, "and that they did not even know where he came from." "True," said the daughter, who had well weighed the excellent qualities and graces of the stranger, "but I know where he is going, and I would like to go with him;" and they walked life's pilgrimage together.

EFFECTS OF PERFUME ON HEALTH.—An Italian professor has made some very agreeable medical researches, resulting in the discovery that vegetable perfumes exercise a positively healthful influence on the atmosphere, converting its oxygen into ozone, and thus increasing its oxidizing influences. The essences found to develop the largest quantity of ozone are those of the cherry, laurel, clover, lavender, mint, juniper, fennel, and bergamot; those that give it in smaller quantities are anise, nutmeg, and thyme. The flowers of the narcissus, hyacinth, mignonette, heliotrope, and lily-of-the-valley develop ozone in closed vessels. Flowers destitute of perfume do not develop it, and those which have slight perfume develop it only in small quantities. Reasoning from these facts, the professor recommended the cultivation of flowers in marshy districts, and in all places infested with animal emanations, on account of the powerful oxidizing influences of ozone. The inhabitants of such regions should, he says, surround their houses with beds of the most odorous flowers.

MIRTH.—There is a large class of people who deem the business of life far too weighty and momentous to be made light of; who would leave merriment to children and laughter to idiots; and who hold that a joke would be as much out of place on their lips as on a gravestone or in a ledger. Surely it cannot be requisite to a man's being in earnest that he should wear a perpetual frown. Is there less of sincerity in nature during her gambols in Spring than during the stiffness and harshness of her wintry gloom? And is it, then, altogether impossible to take up one's abode with truth, and to let all sweet, homely feelings grow about it and cluster around it, and to smile upon it as a kind father or mother, and to sport with it, and hold light and merry talk with it, as with a loved brother or sister; and to fondle it, and play with it, as with a child? No otherwise did Socrates and Plato commune with truth; no otherwise Cervantes and Shakespeare.

SOCIETY has been aptly compared to a heap of embers, which, when separated, soon languish, darken, and expire; but if placed together glow with a ruddy and intense heat—a just emblem of the strength, happiness, and the security derived from the union of mankind. The savage, who never knew the blessings of combination, and he who quits society from apathy or misanthropic spleen, are like the separated embers—dark, dead, useless; they neither give nor receive heat, they neither love nor are beloved. To what acts of heroism and virtue, in every age and nation, has not the impetus of affection given rise! To what gloomy misery, despair, and even suicide, has not the desertion of society led! How often in the busy haunts of men are all our noblest and gentlest virtues called forth! And how, in the bosom of a recluse, do all the soft emotions languish and grow faint!

STATISTICS ABOUT WRITING.—A rapid penman can write thirty words in a minute. To do this he must draw his pen through the space of a rod sixteen and a-half feet. In forty minutes his pen travels a furlong. We make, on an average, sixteen curves or turns of the pen in writing each word. Writing thirty words in a minute, we must make 480 to each minute; in an hour, 28,800; in a day of only five hours, 144,000; in a year of 300 days, 43,200,000. The man who made 1,000,000 strokes with his pen in a month was not at all remarkable. Many men, newspaper writers, for instance, make 4,000,000. Here we have, in the aggregate, a mark of 300 miles long to be traced on paper by such a writer in a year. In making each letter of the ordinary alphabet we must make from three to seven turns of the pen, or an average of three and a-half to four.

The Dumas family has always been remarkable for strength and address. One night at the play Gen. Dumas, the grandfather of Dumas the younger, flung a man out of the stage box on to the stage. Dumas the elder was a man of Herculean strength, and Dumas the younger excels in all games of strength and skill. He is a master juggler, and he can put a frame of knives round a human head leaning against a board, with the most consummate surety of hand. George Sand was a brilliant pupil of Dumas the younger, and in her later years she used to amuse herself for days in this perilous pastime.

THE Rev. Dr. Howard, chaplain to the mother of George III., Rector of St. George's, Southwark, was always in arrears with his tradesman, and was often perplexed to keep them in good temper. He one day took for his text, "Have patience, and I will pay you all." After dilating for some time on the virtue of patience, he said: "And now I am come to the second part of my discourse, which is 'And I will pay you all,' but that I shall defer to a future opportunity."

BRIC-A-BRAC.

THE WATERMELON.

COME to the mortal as he sits
Upon a dry goods box and sips
The nectar from thy juicy lips—
Come to the youngster as he flits
Across the high and peaked fence
And moves with ecstasy intense
Thy charms from off the native vine.
And thou art terrible!
O August born monstrosity!
Incarnate colicosity!
Beneath thy emerald bosom glow,
Like glittering bubbles in the wine,
The lurid fires of deadly woe,
And from thy fascinations grow
The pain, the cramp, the pang, the throe—
And all we fear, or dream, or know,
Of agony is thine.

SOME one has charged Tennyson with plagiarism. We have long suspected the p. laureate has been remodeling the fugitive poems of the Sweet Singer of Michigan:

SUMMER-TIME will come again,
With its softly blowing zephyrs.
Lowing kine are in the fields;
Some are cows and some are heifers.
—Tennyson.

THE PET NAME.

There was an old farmer of Squarm
Who called his wife nothing but Marm,
She said, "It sounds queer,
But if you like it, dear,
I like it; so where is the harm?"

BY adding one vowel to the following twenty-eight letters, they make two lines in verse. They were written over the ten commandments in the Church of Alwelck, in Wales, and remained a whole century before the true sense was found out—

P R S V R Y P R F C T M N
V R K P T H S P R C P T S T N.

THE QUESTIONER ANSWERED.

"Are you an Odd Fellow?"—"No, sir; I have been married more than a week." "I mean, do you belong to the Order of Odd Fellows?" "No; I belong to the order of married men." "Mercy, how dull! Are you a mason?" "No; I'm a carpenter." "Worse and worse! Are you a Son of Temperance?" "No; I am the son of Mr. John Gosling."

A LONDON lady, on her way to Bond street, was accosted by a middle-aged, well-dressed man, who, after some conversation, requested the lady to come and dine with him at a cafe which he named. She at once consented, when he instantly hailed a cab, opened the door, himself, and requested the lady to step in. She made some excuse, and requested him to get into the cab first. On his doing so she shut the door on him, and called out to the driver: "Drive this gentleman to a police station as quickly as possible."

Now that Rowell has walked and Tanner has starved, the next contest will be between two fashionable young ladies who will test their strength by seeing which can wear her spring hat the longest.

THE poet who composed the highly classical ode:

"When I was young and had no sense
I bought a fiddle for 13 pence,"

died in the poor-house. Had he written it:

"When I was young, and had no guardian
I invested my cash on an old accordeon."

a grateful public would have risen up as one man and presented him with a brass medal.

A PREACHER at a Sunday-school excursion described heaven as an eternity of picnics—and several young men members of his congregation, who lugged baskets weighing nearly a ton each, and climbed high trees to put up swings, have left church.—Norristown Herald.

A FORTUNE-TELLER was arrested in Paris, and carried before the tribunal of correctional police. "You know how to read fortunes," said a man of great wit, but rather fond of a joke for a magistrate. "I do, sir," replied the sorcerer. "In this case," said the president, "you know the judgment we intend to pronounce?" "Certainly." "What will happen to you?" "Nothing!" "You are sure of that?" "Yes; you will acquit me." "Acquit you?" "There is no doubt about it." "Why?" "Because, sir, if it had been your intention to condemn me, you would not have added irony to misfortune." The president, disconcerted, turned to his brother judges, and the sorcerer was discharged.

A PASSER-BY puts his head in at the window of a shop where an honest cobbler is working, never thinking of evil, and says, cheerily:

"Well, my friend, how many thieves are there in this street without counting you?"

"What!" yells the cobbler, without counting me?"

"Well, then," says his impurturbable questioner, "how many are there counting you?"

A FLOCK of girls is called a bevy; a bevy of wolves a pack; a pack of thieves a gang; a gang of angels a host; a host of porpoises a shoal; a shoal of buffaloes a heard; a herd of children a troop; a troop of partridges a covey; a covey of beauties a galaxy; a galaxy of ruffians a horde; a horde of ruffians a heap; a heap of oxen a drove; of blackguards a mob; a mob of whales a school; a school of worshipers a congregation; a congregation of engineers a corps; a corps of robbers a band; a band of locusts a swarm, and a swarm of people is called a crowd.

The vigor of youth given to the aged and infirm by using Hop Bitters. Try it.

For Women.

CONDUCTED BY MISS RAY CLARK.

A MYSTERY.

MARY C. BARTLETT.

PHIL by mother's bed was sitting,
Playing nurse, while Bess was flitting
Shyly, slyly, in and out,
Hiding now, with saucy pout,
Sparkling eyes, and sunny hair,
Deep in Grandma's apron, where,
'Mid soft folds of dainty wrapping,
Lay the baby—napping, napping.
Then, with merry laughter, springing,
Through the room her sweet voice ringing,
As she chattered, gayly scorning
Philie's anxious look and warning.

"Can't I wake her, Grandma, never?
S'posin' she should sleep forever!
And do tell me, Grandma, dear,
How the baby came down here.
Did she walk, or did she ride?
Did she run, or did she slide?
Did she jump, or did she fly
Like a birdie from the sky?
Tell me, Grandma, tell me true:
Did you see her comin' froo?"

All important then rose Philie:
"Nonsense, Bessie! Don't be silly.
I can tell you all about it.
Bridget says—and I don't doubt it—
That the baby came from heaven,
At exactly half-past 'leven
Thursday night. The angels brought her
To the door, and Grandpa caught her
In his arms and held her tight.
While she kissed them all good-night.
Grandpa guessed what they were bringing,
'Cause he heard the angels singing."

Softly Bessie's blue eyes glistened,
Growing larger as she listened,
Nothing doubting. Sure 'twas meet
Heaven should send a boon so sweet.
Yes, she knew the angels brought her;
But if she had only caught her,
If she had only had a sight
Of those shining garments white,
Just a glimpse. Oh! well she knew
She'd have kept the angels too.
How she wished she'd heard them singing.

But just then there came a ringing
At the door. Quick Philie started,
Cheeks aglow and lips half parted;
While, with golden tresses flying,
Followed Bessie, wildly crying:
"Hurry, Philie! Hurry, brother!
P'r'aps the angels brought another."

FASHIONS.

BUFF and dark red plain calicoes are used for plaiting on the bottom of cambric dresses.

Many house corsages are worn open at the throat, in either pompadour or heart shape.

Buttons in the form of large hooks and eyes in glittering steel are used for dresses, or are worn singly for fastening the collar at the throat, the cuffs at the wrists.

A boa of orange blossoms encircling the neck and extending to the left side of the belt, is a new ornament for a bridal costume.

The woven initials in red cotton on a fine cambric tape, can be had for ten cents a dozen. They are much in favor for marking underwear.

The large Louis XIII. collar of cambric now worn, is trimmed with a deep border of embroidery or old lace, and deep cuffs to match, which are laid over the dress sleeves.

Wreaths of flowers are worn round the throat, and also on the edge of square-cut dresses. Those round the neck, which are made full like a ruche are used in the daytime for dressy occasions. The lace stands up round the throat above the collarette of flowers.

Some pretty black lace jackets have lately been introduced, with hoods lined with cream satin, on which are embroidered or painted a flower, bud and leaves. These look well over dark as well as over light Summer dresses. The Spanish mantilla has also reappeared. It is so arranged that the upper part looks like a hood. It is caught up at the arms with bows of satin ribbon.

Bonnet shapes are now sold composed entirely of flowers, to which the purchaser has only to add a small scrap of lace or material for the crown and strings, to make the headdress complete. Those in tea roses are very pretty. They are the close-fitting French shape, both fashionable and becoming.

The rush or Zulu hats are this year adorned with a wreath of dried grass and grain, with a few poppies. They are very inexpensive, and look pretty. Coarse straw, and a new kind called Porcupine hats, are also trimmed with grasses.

Jerseys are much worn, especially in thin dark blue merino and white, with very light skirts and scarves of spotted or plain foulard and satinette. I have seen young girls' dresses of white jerseys, light blue flannel skirts, scarves, toques, and capes of striped blue and white flannel, with loops of ribbon. These are used as traveling dresses also. Other serge dresses have narrow blue and white striped serge applied as kiltings, and as a plaited flounce round the bodice, which is cut in points. Braiding on plain colored serge is arranged in close rows down the front, and horizontally across the tunic, the braid being very narrow.

Some of the prettiest seaside dresses are made of "duster" cambric, in pink or blue, trimmed with cream-colored lace, and are worn with large shady hats of the same material, trimmed with lace and one tuft of flowers. Turkey red twill is much patronized, and white dresses are looped over underskirts of it, made with plaited flounces, as well as trimmed with it.

A costume of red twill and white cambric was made with a deep jacket bodice of red twill, with pockets, cuffs, deep collar, and revers of coarse cream lace, a cambric skirt prettily made, with a narrow plaiting of red, a bonnet of red, with coarse lace turning over the brim, and also arranged as a fan in front, and red hose.

The handkerchief dresses are now reproduced in woolen material, the stuff being printed in squares in such mixtures as violet and black, old gold and green, red and black, red and blue. They are made up in the same way as the cotton handkerchief dresses.

People exert their own taste so much now that costumes vary considerably, and all sorts of old-fashioned colors, materials, and styles of make are now seen.

HOME-DRESS FOR LITTLE GIRL FROM EIGHT TO TEN YEARS OF AGE.—FIG. 281.

The dress illustrated is of gray checked material trimmed with kiltings of the same and blue porcelain buttons. Many other shades may be used, either singly or combined with equally as good an effect. Partly worn material may be utilized, making a pretty costume with but little expense.

FOREIGN TERMS.

THE following glossary is given for the benefit of many who are not familiar with the peculiar names of fashions and materials:

Bayaleuse, or Sweeper—The plaiting of lace and muslin or silk set on the inner edge of the train of handsome dresses.

Beige—The color of unbleached wool.

Boarette (from refuse)—A rough surfaced fabric, either cotton, wool, or silk, with irregular threads of color interspersed therein, as though the material were woven of odds and ends.

Bouffante—Puffed out.

Bouillon—A puffing set on as trimming.

Cutrass—A close-fitting basque; long on the hips and fitting the figure like a glove all round.

Corsage—The dress waist.

Coulisse—Shirred.

Carrick Capes—Small capes, or large collars, like those on a coachman's coat.

Demi train—A short train, *i. e.*, in length from a few inches to half a yard.

Faille (pronounced *Faye*)—A soft, thick silk.

Fichu—A small cape, usually of lace or tulle, worn over the dress.

Fraise—A standing ruffle worn in the neck.

Gilet—Vest.

Jabot—An arrangement of lace and loops of ribbon, either or both, down the front of the dress.

PERSONAL APPEARANCE.

A CELEBRATED author has politely said, "No woman is ugly, though one may be less favored than another." There is some consolation for the "less favored" in knowing that good taste in dress, and the harmless appliances of the toilet can in a great measure compensate for want of personal beauty. We desire, however, to warn our readers not to attempt to produce by artificial means those graces which nature has denied them. They will derive no real advantage in making dark hair golden, in preparations to render the eyes lustrous, in artificial bloom for the cheeks, nor in the abundant use of powder; all these artifices have a rather ghastly effect in the light of day, and should be left to the stage. It is a part of the profession of the actress to understand and avail herself of all such cosmetics as art places at her disposal; but this does not in any way excuse young ladies for having resource to them. The best means to preserve the charms of youth are abundant use of the bath; quiet, regular living, plain, wholesome diet; early hours; a proper amount of exercise in the fresh air, and sufficient useful occupation both for the mind and body.

HINTS.

THE PAPER LAMP SHADES so fashionable just now can be made very easily. Fold a sheet of tissue paper in the center forming a half square; then fold again into a quarter square, then into an eighth; continue folding in this way as long as possible, always folding from the center. Holding the thick part firmly in one hand draw it through the other till the paper is thoroughly creased; then partly unfold and draw it through the hand from the center to the outer edge. When it has become well creased cut enough from the center to allow of its slipping over the lamp shade.

CORRESPONDENTS' CORNER.

IN answer to the young lady's inquiry as to where she can obtain London Hair Restorer. I saw it advertised. My bottle was a present. A druggist will procure it if applied to.

MISS M. D.

EUGENIE, it is said, intends to leave Chiselhurst, and take with her the remains of the prince imperial.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

TAPIOCA.

ELINOR BROOKS.

WHEN we first began to entertain our neighbors as guests in our rural home, I was often surprised to find them unfamiliar with tapioca as an article of food; in fact, some of them had never even heard the name. I have sometimes wondered whether such was the case generally throughout the country; if so, it is to be regretted, for it is an iguorance of a most palatable and nutritious food, quite as valuable and as cheap as rice, and when cooked somewhat resembling it in its starchy nature, yet having enough difference to make an agreeable change. It is easily prepared as food, and to its other good qualities adds that of keeping well. This we have thoroughly tested, as at one time our "gen'rous pervider" purchased so large a quantity that three years afterwards there was still a remnant which was as sweet and nice in every way as it had been when first placed in the store-room.

Cassava, from which tapioca is prepared, is as standard an article of food in South America as wheat, corn and potatoes are in the United States. I quote from Scribner's Monthly for July 1877 a description of the manner in which it is prepared for use.

"The cassava, also called mandioca, roots which are shaped something like dahlia roots only larger, are thrown into pools of stagnant water and left there until fermentation takes place, which is usually in about two days. The tough outer skin is then easily scraped off and the roots are grated on a board covered with sheet copper full of nail-holes. After this the grated mass is placed in a long tube (woven of palm-fiber) and this is pressed until a whey-like liquid flows from it. The starch which settles from this liquid is the tapioca of commerce; while the coarse white meal which is left in the basket-work tube, is, after sifting, made into the "staff of life" by the South American housewife. It is described by many travelers as exceedingly nutritious bread and if dried for a few hours in the sun soon after it is baked, it becomes hard and crisp, has a sweet, nutty flavor and will keep for months."

[Mrs. Brooks's recipes for cooking tapioca will be given next week.] E. M.

DOMESTIC RECIPES.

Squash Pie.

To a pint of boiled, mashed and strained squash, add two cups of sweet milk, a cup of white sugar, four beaten eggs, half a teaspoonful each of ground cinnamon and ginger, and a pinch of salt. Beat thoroughly and bake in tins lined with a good paste.

Tomato Salad.

Pare with a sharp knife—do not scald—and cut into thin slices. Put into a salad-dish and pour over a mixture made of two tablespoonsful of good oil, mixed with a teaspoonful of sugar, half a teaspoonful of made mustard, salt and pepper, after which whip in, a little at a time, five tablespoonsful of vinegar.

MRS M. G.

Clam Soup.

Open 50 medium-sized clams, cut off the hard parts and put the soft pieces where it is cool. Strain the liquor and put it with the hard bits over the fire. Add a quart of hot water, one teaspoonful each of minced onions and parsley and two blades of mace. *Simmer*, not boil, three-quarters of an hour. Put two cups of milk into another dish to heat, then stir in a tablespoonful of flour, rubbed smooth in two tablespoonsful of butter. Set the dish in hot water until the soup is ready. At the end of the three-quarters of an hour, strain the clam-broth, leaving out the hard parts. Now put in the soft parts, let come to the boiling point, and that is all; season with pepper, turn into the tureen, add the hot milk and butter and serve. Butter crackers and slices of lemon may be passed with this soup.

Crab Soup.

Two pounds of any kind of fresh, lean meat, chopped fine. Pour over two quarts of water, boil slowly until reduced one-half, strain, let cool and skim and season with pepper and salt. Return to the fire adding a cupful of hot, soft-boiled rice. Simmer a few minutes, then strain, pressing the rice through the sieve. Set over the fire and add the meat of four large, boiled crabs, cut into bits. Simmer 10 minutes longer and turn into a tureen with a pint of boiling milk thickened with a spoonful of flour rubbed to a paste in two spoonsful of butter. Stir up and serve. Crackers and lemon may be passed with it the same as with clam soup.

LONG ISLAND.

Tomato Soup, Without Meat.

Put a spoonful or more of nice pork drippings into the soup-pot over the fire, when hot throw in a sliced onion and when the pieces are of a brownish hue add 15 medium-sized ripe tomatoes, peeled and sliced. Stir until well heated through, then add a quart of boiling water and a tablespoonful of chopped parsley. Cook slowly half an hour, strain, pressing through the tomatoes. Return to the pot, season with pepper and salt, a teaspoonful of sugar, two tablespoonsful of butter rolled in a spoonful of flour and a teacupful of hot boiled rice. Cook slowly 10 minutes longer and pour out.

Tomato Soup, With Meat.

Skim and strain a gallon of stock made from fresh meat, skim and slice a dozen large, ripe tomatoes, put through a sieve and add to the stock. Boil half an hour. Mix smooth a spoonful of flour, a little butter, be careful not to have it lumpy, season with pepper, salt and a teaspoonful of sugar. Simmer 10 minutes and it is ready to serve.

MRS. JANE JONES.

QUESTIONS ANSWERED.

Pickling Cucumbers for Sale.

A. J. Staunton, Mich., asks how to put up cucumbers for pickles for the wholesale trade.

ANS.—The cucumbers should be sorted into even sizes, placed upon trays of wood, sprinkled with salt, and left to drain for six hours. They are then put into barrels or hogsheads with saturated brine; that is, brine that will not take up any more salt. If the color is desired to be kept green plenty of vine leaves may be laid in layers among the pickles. Stored in this manner they may be kept until sold, when they may be disposed of either in barrels or in bottles and packed in fresh brine, or in vinegar. When put up in vinegar for sale, the cucumbers are steeped in water and freshened for 12 hours; then drained dry, and packed either in barrels, bottles or jars, with some spice, as ginger, red peppers, mace, and allspice, scattered among them; and then covered with pure cider vinegar; or other vinegar that is free from sulphuric acid, which soon makes them soft. When put up in jars or bottles, carrots are cut into ornamental slices, and placed among the pickles, with some small red peppers against the glass. The salt turns the cucumbers brown; the color may be restored by mixing the cucumbers with grape-vine leaves and scalding them with hot brine. But purchasers are generally sensible enough to be satisfied with the natural color.

Okra Soup.

WE are requested to give directions for the above. We append recipes for both plain okra and okra and tomato soup.

No. 1.—A pound of "round" steak cut into dice, two tablespoonsful of good drippings and a sliced onion. Fry all together in the soup-pot until well browned. Then add four quarts of cold water and simmer two hours; to this add a quart of sliced okra, a spoonful of parsley, and simmer two hours longer. Season with pepper and salt, strain and serve.

No. 2.—Take a good beef-bone with a pound or more of meat on it, place in a kettle on back of the stove, adding four or five quarts of cold water. Cover tightly and simmer three or four hours. Remove the fat, add a minced onion, a tablespoonful of minced parsley, three quarts of sliced okra and a quart of peeled and sliced tomatoes. Season and cook slowly two or three hours longer. Strain and serve. The tomatoes may be omitted in this last recipe and a third more okra substituted.

We know Hop Bitters are above and beyond all as a nutritious tonic and curative.

News of the Week.

HOME NEWS.

MONDAY, Aug. 30.

A furious storm of thunder, lightning, hail and rain passed across the country from Pennsylvania to the Atlantic Ocean on the 25th, doing considerable damage on its way .....The conductor of a freight train on the Pan Handle Road put off a party or tramps near Piqua, Ohio, on the 26th, who were stealing a ride, when one of them fired at the train and struck a brakeman named John Kelly in the eye. The wound will probably prove fatal. The tramps escaped, but are being pursued. .....It is officially announced that the Army of the Cumberland will hold its reunion at Toledo, Ohio, September 22 and 23.....Great damage has been done to the growing crops in the township of Buckland, Bellechasse county, Quebec, by hail storms, the settlers in many instances having lost their entire crops.....The rain of the 24th extended over a large area of country in Illinois, and its effect on the corn crop will doubtless be most favorable, as the stalks were drying up very fast in some localities.....Eight hundred and thirty hostile Sioux Indians have surrendered to Colonel Miles at Fort Keogh, Montana, and one thousand more are on their way to his camp, desirous of doing likewise.....A reduction is to be made in the rate of postage on newspapers mailed to foreign countries belonging to the Universal Postal Union on and after October..... A fearful storm prevailed along the Texas coast on the 12th and 13th instant, and it is reported that the city of Brownsville has been nearly destroyed and many lives lost. The latest news of the late storm on the lower coast of Texas and in Mexico disclose that it was one of the most destructive that has visited that region for years. Hundreds of houses were either completely demolished or unroofed in Matamoras. At Brownsville many buildings were ruined, and at Point Isabel and Brazos quite a number of vessels were wrecked and several lives lost. The total damage to property is estimated at upward of $1,000,000..... There is a call for a Mississippi Valley Convention to be held at New Orleans, October 12th, to consider the improvement of the commerce and navigation of the river. This call originates with the central committee appointed at the convention at New Orleans in 1876. The question is one of great interest to the Mississippi valley, and the proceedings of the convention will be watched with interest.....The Pennsylvania railroad is making very great efforts to straighten and lessen the grades, and otherwise improve the condition of that great trunk line. The passenger traffic has increased to the amount of $1,000,000 over 1879.

In a difficulty on the 25th at Leesville, Texas, twenty miles from Gonzales, the three Littlefield brothers—William, Philpp and Houston were killed.....Matt and Bill Potter, Roll Dublin and Jim Wilkins pleaded guilty at Austin, Texas of robbing the mails, and have been sentenced to ten years' imprisonment.....The eighth annual convention of the North American St George's Union opened at Ottawa, Ont. Delegates from Canada and the United States are in attendance ..... Five buildings occupied as saloons, concert halls, shooting galleries, restaurants, etc., near the Bay District race track, at San Francisco, were burned on the 26th. Loss, $30,000 partially insured.....Officer B. F. Vaughan was shot on the 23rd by Buck Rockwell, a notorious confidence man, at Arlington, Ky., on the Chicago, St Louis and New Orleans Railroad. Rockwell made his escape.....A collision occurred between two passenger trains on the joint track of the Rio Grande and South Park Railroad on the 25th, near Leadville, but no one was hurt.....John Law died at Madison, Ind., on the 26th from the effects of the shot wound inflicted by Stucker, who found Law in criminal intimacy with Mrs. Stucker..... The funeral of Isaac H. Brown, sexton of Grace church New York, attracted a large attendance. The Masonic fraternity was largely represented. ....Abram Davidson, 28 years old, of Stuyvesant, N. Y. brakeman on the Hudson River Railroad, while riding on the top of a freight car came in contact with a bridge at Spuyten Duyvel, and was instantly killed.....The first bale of the new crop of North Carolina cotton was sold at New York by auction at 13 cents per pound. It grades strict low middling to middling, and it is about ten days earlier than the first bale of last year from North Carolina.

Henry Wade, a farmer living near Chillicothe, O., had a fight with a party of nine tramps in consequence of their depredations upon one of his fields, and shot several of them. One, who was wounded in the thigh, gave the name of Frank Cooper, of Philadelphia.....Warrants were issued at Richmond, Va., for the arrest of Dr George B. Johnston, son of United States Senator Johnston, and Captain John S. Wise, son of the late Governor Wise, upon the charge of being about to engage in a duel. Johnston was arrested and gave $2,000 bail for his appearance at the Police Court, but Captain Wise was not found. The trouble arose from Wise being blackballed about a year ago on applying for admission to the Westmoreland Club, a high-toned social organization.....Hon. Horace Maynard has gone to Washington to enter upon his duties as Postmaster General.....Assistant Secretary of State Hay has sufficiently recovered from his recent illness to be able to perform his duties as Acting Secretary of State.....For the week ended on Friday the 27th, there were forty deaths from yellow fever and four from smallpox at Havana. Ten persons have died from the contagion of glanders... ....James Thorp, a workman in the Missouri Pacific Railroad machine shop at Kansas City, Mo., shot and killed Alfred Terry, in an altercation. Thorp was arrested.

The steamer Marine City, of Detroit, was burned to the water's edge, near Sturgeon Point, Mich., on the 29th. It is supposed that five passengers were drowned.....Ouray, the noted Indian chief, died at the Ute Agency, on the 28th. .....The flour mill of William B. Thomas & Co., the hollow-ware foundry of Stuart & Peterson and several buildings adjoining, in Philadelphia, were burned on the 27th ult., entailing a property loss of over $200,000.....The New Jersey Greenbackers have nominated General Thomas B. Hoxie for Governor... ....The Iowa Republicans have renominated J. A. P. Hall for Secretary of State.... ....The population of Charleston, S. C., has increased two and one-fifth per cent. during the past ten years .....The Hon. Horace Maynard was sworn into office as Postmaster-General on the 26th inst.....A terrific thunder-storm passed over Bridgeport, Conn., the lightning striking a number of buildings in the city and its immediate vicinity.....Horace Jarvis was killed on a farm near Haysville, Ohio, on the 26th ult., upon a thrashing machine while it was in motion..... Assistant Surgeon O'Connor reports to the Marine Hospital Bureau that the Board of Health, at Evansville, Ind., has declared typho-malarial and typhoid fevers epidemic in that city.

Gen. A. J. Myer, Chief Signal Officer of the United States, and long known as "Old Probabilities," died at Buffalo, N. Y., on the 24th. Gen. Myer was born at Newburg, N. Y., Sept. 20, 1828. The cause of his death was what is known as Bright's disease, with an affection of the heart, from which the General has long been a sufferer. .....The discovery of the fact that Jacob Zechler, of Albay, in Berks County, Pa., has for 27 years kept his insane brother Benjamin chained in a house has created quite a sensation in that vicinity.....The deaf mutes of America held in Cincinnati on the 25th their first convention. There was a fair attendance from all parts of the United States and Canada. Robert McGregor, of Cincinnati, was elected President .....Richard O. Adams, the defaulting postmaster of Deadwood, D. T., who was to have been sentenced, escaped from the custody of the Marshal, and a large reward has been offered for his capture..... John Elliott, 25 years of age, while playing baseball at St. John, N. B., was struck in the neck by the ball and instantly killed.'.....The tannery of Norbert Germain, of Quebec, together with the contents and valuable machinery, was burned on the 25th. The loss is $20,000.....Mr. Thomas Hughes, author of "School Days at Rugby" and "Tom Brown at Oxford," and chairman of an association of gentlemen, English and American capitalists, for the purpose of developing the table lands of East Tennessee, has just arrived in New York with several of those interested with him, and will proceed at once to inaugurate a colony upon a tract of between 300,000 and 400,000 acres of land which has been purchased for this purpose. It is proposed to enter into a general business of agriculture, mining, and manufacturing, for which the territory is adapted.....A fire destroyed the paper warehouse of Averill, Russell & Carpenter, on Lower Third Street, St. Paul, Minn., occupying two buildings, and the wholesale grocery of P. H. Kelly & Co., adjoining. The fire spread with great rapidity, and it is feared that one man was killed by the falling walls of Kelly's house. The store of Beaupre, Allan & Keogh, next door, was saved with difficulty after a loss of $10,000, which is covered by insurance. The loss on the building occupied by Averill, Russell & Carpenter is $45,000; insured for $12,000. The loss on the Kelly building was $60,000; insured for $20,000. The loss of P. H. Kelly & Co. is estimated at $400,000; insured for about $300,000. The loss of Averill, Russell & Carpenter on stock is $125,000; insured for about $77,000.

Three children of Antoine McCarty were thrown from a wagon at Memphis, Tenn., on the 26th, by the horse becoming frightened and running away while they were playing in the vehicle. One child was unhurt, another only stunned and the third was killed.....A waterspout burst along the line of the Cleveland, Mount Vernon and Columbus Railroad on the 27th, flooding the track to the depth of five feet in some places and delaying trains.

About 260 mechanics and blacksmiths in the employ of the Chicago, Milwaukee and St. Paul Railroad struck for a 5 per cent. advance in wages. ..... It is reported from Austin, Minn., that Judge Page was shot in his house on the night of the 25th and killed by an unknown assassin. He has for years been the principal mover in a great political, social and religious feud that has agitated Southern Minnesota.....Complete census returns show the population of Wisconsin to be 1,315,464, an increase of 206,794 since 1870.

Senator Hill, of Georgia, is said to be suffering from a cancerous tumor on his tongue, that threatens to terminate his career as a public speaker if not to end his life, there being doubts as to the permanent removal of the tumor.

FOREIGN.

More than the Eastern embroglio, more than the war in Afghanistan, the troubles in Ireland now excite public attention in England. Troubles in Ireland, 'tis true, are chronic, but they are daily becoming more acute and dangerous. The short crops last year rendered thousands of tenants unable to pay their rents, and the landlords are taking advantage of this misfortune to get rid of small cottagers whom many of them have for a long time regarded as nuisances on their property. Many of these tenants had only from half a dozen to a dozen acres of land, so that labor-saving machinery could not be used by them; they were constantly behindhand a trifle; and each of them, if pressed, became a bitter personal enemy of the landlord, hence the desire of the latter to clear their estates of this class of petty farmers. Evictions are constantly taking place, some quietly, while in other cases the constabulary have to be called in, and when this is the case, the assembled peasantry usually have a "shindy" with their blue-coated foes. Such a fight took place the other day at an eviction near Dungannon, when the police, assailed with clubs, stones and pistol shots, fired on the mob at first with buckshot and then with ball—result, some 38 known to be more or less severely wounded and one killed. Meanwhile, Fenianism is growing; and serious trouble is threatened in the near future. The harvest is splendid throughout the whole island, and the resulting prosperity may have a soothing effects. The country is by no means poor now. In a late petition presented to the House of Commons by the Irish bankers, they say that they hold about thirty-one millions sterling on deposit, equivalent to about two and a half times the valuation of Ireland, or, by a rough calculation two years' rental.

In England the event of the week has been an attempt on the part of the Irish Home Rulers to block legislation in the House of Commons unless the government consented that the Irish constabulary—now a semi-military organization—should be ordered not to assist in making evictions of delinquent tenants. The matter came to a head when the Supply bill for the pay of the constabulary got before the House. The Home Rulers, by making long speeches simply for the sake of passing time, and dilatory motions, forced the House to make a session of 17 hours, and even then a compromise had to be made with them, it being agreed to defer taking the vote until the following day. Tactics of this sort will doubtless be frequently employed by them in future, as they have been sometimes in the past. Mr. Gladstone is taking a voyage around England for the benefit of his health.

On the Continent there is little of general interest to tell of this week. In France Gambetta and his followers bitterly denounce De Freycinet's late declaration that repressive measures would henceforth be confined to the Jesuit order, leaving the other religious orders in peace. They declare that all the orders must be treated alike and expelled. As this is a family quarrel among the Republicans, Imperialists and Monarchists rejoice, and it is not unlikely that De Freycinet will either have to "eat humble pie" or lose the premiership. In Russia Nihilists appear to be a thing of the past; congratulations on the matter are general. Turkey still persists in doing nothing towards solving the Eastern problem. The Powers have sent to the Porte an identical note courteously but firmly insisting that the cession of territory to Greece and Montenego demanded by the late Conference at Berlin, must be made at once. England, France, Germany, Austria and Russia are preparing to make a joint naval demonstration in Turkish waters in support of their demands. A large fleet made up of mighty iron-clads from each of these Powers is to visit the Turkish coast and perhaps Constantinople—but what will be the practical good of the show no one seems to know.

At the present time Canada is attracting a great deal of interest, not only among English, but also among French capitalists. The formation of the Credit Foncier in Paris, with a capital of $25,000,000, to be invested in Quebec in real estate is only second in importance to the sale of the Canada Pacific Railway in Great Britain. Another company, with a capital of two millions, has been organized also in Paris, under the title of L'Union Sucriere du Canada, to carry on the manufacture of beet root sugar. Quebec, Berthier and St. Johns, in the above Provence have been selected as sites for factories. They have already guaranteed each for twelve years for 1,000 acres of beets annually. Factories are also to be built in other districts and arrangements are being made to obtain 1,000 acres of beets at Varennes. About $120,000 will be expended on each factory.

[Washington Critic.]

Saved by Oil.

Mrs. Susanna Asmus, No. 11 Bartlett street, Baltimore, Md., had for twenty-two years been a sufferer from sores and pains in her limbs. She tried many remedies without any favorable results. Happening to hear of St. Jacobs Oil, she concluded at last to try it. The result was wonderful. The sore healed, the pains vanished, and she is now well again.

AGRICULTURAL NEWS.

THE Mark Lane Express, of the 23rd, in its review of the British grain trade for the past week, says: "It is rather too soon to make a definite statement in regard to the quality of the new wheat crop, but the majority of the samples exhibited during the past week were decidedly fine, and sold readily at 44@50s. a quarter. The supplies of last year's growth are quite insignificant. A reduction of a shilling to two shillings failed to attract buyers. The demand for foreign was unusually light. The bulk of arrivals have been warehoused. The tendency of prices is downward, though transactions are so limited as to scarcely warrant recording any actual change of quotations. American mixed maize readily commanded 23 shillings ex-ship, but any attempts to advance this quotation was strenuously resisted. Sales of English wheat for the week were 11,845 quarters at 43s. 9d.....A supplement to the same number exhibits 433 reports from agricultural districts. They show that wheat is below the average, barley above, oats and beans a little above and peas a little below. The result of the second hay harvest will probably make up for the deficiency of the first cut. Turnips are as much over the average as mangel-wurzels are below. Potatoes are expected to be an unusually heavy crop. Two hundred and forty-eight reports say more or less disease has appeared; 32 say there is no disease, while in 50 disease is not mentioned. The supplement classifies reports received as follows:

Crop Reports.	Over Average.	Average.	Under Average.
Wheat	34	185	115
Barley	96	202	302
Oats	97	187	43
Beans	63	126	41
Peas	46	124	70

Wheat is considerably affected with blight and mildew. A few returns declare the general state of the crops to be as bad as it was last year; but for the country at large, the prospects, though not as bright as some sanguine writers have reported, are much better than they were at this time last year. The quality of wheat and rye is generally good.....The French harvest will be above the average. The Belgium and Holland harvest is well nigh finished, with excellent results. Rye crop in Saxony, Pomerania, Brandenburg and Holstein about average, but in Bavaria, Franconia and Suabia the rye crop is magnificent. Wheat throughout Germany fairly good, though there is considerable rust and mildew. Accounts from Austria, Hungary, Spain and Italy are uniformly good.....James Caird, an eminent agricultural authority, writes that the agricultural returns from Great Britain and Ireland show, as compared with 1879, a slight increase in the acreage of wheat, a decrease of 7½ per cent. in barley, an increase of five per cent. in oats and scarcely any change in potatoes. The quality and yield of wheat will be so greatly superior that if the present splendid harvest weather continues a fornight longer, "we may reckon on a crop of 3,000,000 to 4,000,000 quarters, or nearly two months' consumption better than in 1879. Potatoes promise most favorably. The dry, clear weather will, it may be reasonably supposed, go far to check the further progress of disease. Grass and green crops, except mangold, are abundant. The first hay crop was light and much damaged by rain, but it will be largely supplemented by a heavy late crop. Cattle are deficient to the extent of 90,000 head and sheep nearly 2,000,000, or 5½ per cent., in consequence of the rot resulting from the excessive wet last season.".....Two artesian wells are about to be sunk in the far West, according to the act of Congress passed at its last session, the object of the experiment being to see whether land now valueless cannot be thus reclaimed to agricultural purposes. The headquarters of the Commissioner that has the matter in charge will be at Denver.....

The Rev. S. S. Bartlett and Mr. J. A. Scharer of Norton County, Kansas are in St. Louis soliciting aid for the starving and destitute in the northern part of the State, in the counties of Norton, Jewell, Washington, Smith, Decatur, Rollins, part of Phillips, Graham, Trigo, Ellis, and others, all located in the northern part of Kansas. The lowest estimate places the number of people who are suffering at 25,000. The cause of the affliction is a drought. Their last year's crops were only limited. Last Fall they sowed wheat, but it died. There was no snow to give any moisture, and no rains, and this crop perished. Spring wheat was sown, but that failed also, on account of the severe drought. Corn was next planted, but another plague appeared—the green worm—not the Army-worm, but similar in appearance. While it destroyed some fields entirely, it only ate up the stalks of the others, and these last revived, and there were hopes that some of it might still be gathered in: but the people were once more disappointed. The chintz bug followed the green worm and completed the destruction of the latter. And now the crops are completely destroyed, and want and hunger are staring these twenty-five thousand people in the face. The potato crop is also ruined. Many of the settlers there came from Missouri and Iowa. Up to about six weeks ago it was thought the suffering would not be so general. Gov. St. John declared the State would be able to take care of its destitute, but these calculations were erroneous, and since that time Gov. St. John has advised all the people in the drought-visited district to leave Kansas if possible.....

Agricultural Commissioner Le Duc has recently been selecting sites for tea farms in Georgia, and has returned to Washington, leaving an assistant to complete the work. He thinks that he will have no difficulty, as the problem of tea culture at the South, or at least in Georgia, has been already solved .....Lynn, Mass has a pear tree that is covered on one side with ripening fruit, while the opposite side is covered with blossoms, ...California has as many acres under wheat, 3,227,000, as Great Britain, and produces half as many bushels, 56,000,000.....Cucumbers are coming to the pickle factory at Nunda, McHenry Co., Ill., at the rate of five thousand bushels a day. .....Army worms made their appearance in swarms in the northern parts of Indianapolis, the the other day.....Some months back the RURAL noticed the departure of Mr. D. A. Jones across the Atlantic in search of Cyprian trees. He returned a few days ago with 200 swarms procured by him in Cypress and the Holy Land at a cost, *it is said*, of about $100 for each swarm .. ...

The agricultural implement dealers of Minneapolis state that their sales this year have been unprecedented, and all dealers allege that their stocks have been absorbed clean as a whistle ..... Our contributor Prof. J. P. Sheldon, of England, and other delegates of the British tenant farmers, arrived at Quebec a week ago. They visit Manitoba to report on the suitability of that country for agricultural immigration.....

The Acting Secretary of the Treasury has declined to grant the request of certain importers of cattle who asked that the quarantine required for cattle coming from infected ports might be established at some inland city instead of at New York. The importers wished to ship the cattle on arrival at New York to the West and establish a quarantine at Buffalo. The Treasury Department decided that would be an evasion of the regulation and would defeat the very purpose for which it was established.....It is estimated that the tobacco crop of the five counties of York, Lancaster, Berks, Chester and Bucks, Pa., will be worth $6,000,000 this year, and the value of the crop in the entire State between $8,000,000 and $10,000,000.....Information has been received by some members of the Produce Exchange here that Asa Dows, one of the largest operators on the Chicago Board of Trade, and who recently refused to respond to a call for more margins on pork, which he had sold "short,"

has suspended. He is said to have lost a quarter of a million in pork.....

England imported during the first part of the present year 7,213,935 pounds of goats' hair, valued at £635,887 (over $3,000,000), being an increase over the same period of the preceding year of 4,477,131 pounds.....At Mount Sterling, Kentucky, an auction sale of Short-horn cattle came off lately. Sixty-five head of cattle were sold at an average of $233 per head.....The National Exchange Bank of Auburn, N. Y., has brought suit against several farmers of Suffolk county for the payment of notes for sums ranging from $100 to $200. The farmers claim that they never made the notes, and have retained District Attorney Petty to look after their interests. The farmers say that last Spring they were waited upon by a man who represented himself as the agent of a fertilizing company, and they contracted with him for fertilizers to the amounts of the different notes. They were not to pay until they had a chance to test the quality of the fertilizer, and if it was not what it was represented to be they were not to pay anything. They signed what the agent said were contracts, but which turn out to have been notes. They say they never received the fertilizers.....

From the most reliable reports the Canadian crop of potatoes in nearly all the principal sections of Quebec will be unusually large, and at present it looks as though a season of low prices was ahead. In Ontario the crop is also turning out satisfactorily in many sections. The quality of Early Rose and Chili grown in the vicinity of Toronto is remarkably fine and the yield large.....The Hungarian wheat crop is exceptionally good, giving a surplus of about 30,000,000 for export.....

The Greatest in the World.

Without a question, Buffalo, New York, can boast of the largest and most complete private Sanitarium in the world. The Invalid's Hotel was founded by Dr. R. V. Pierce, who has represented his district as State Senator and in Congress, and is known throughout the United States as the originator of Dr. Pierce's Family Medicines, and who has also become widely celebrated in the treatment of chronic diseases. The erection of this mammoth home for invalids was made necessary by the large number of afflicted who flocked to Buffalo from all parts of the United States to consult Dr. Pierce and the eminent medical gentlemen associated with him as the faculty of this celebrated institution. The establishment is said to have cost nearly a half million dollars, and is furnished with every appliance and facility for the care of chronic ailments. A correspondingly large branch institution is located in London, England. The whole concern is owned and operated by the World's Dispensary Medical Association, of which the original Dr. Pierce is President—his brother, an uncle, and other eminent medical gentlemen taking part in the treatment of cases. In treating cases they are not all confined to the narrow limits of prescribing the justly celebrated remedies. Dr. Pierce's Golden Medical Discovery, Pleasant Purgative Pellets, or any set remedies, however good, but have resort to the whole range of the *Materia Medica*, as well as to Turkish and other baths, Swedish movements and other approved remedies and methods of cure.

Parents, do not use vile drugs or nostrums in your families, but use pure Hop Bitters.

The first thing to do in the Spring is to clean house. For internal cleansing and renovating, no other medicine is equal to Kidney-wort.

Don't keep taking drastic pills—they do more harm than good. Kidney-Wort cures constipation.

Health, hope and happiness are restored by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all those diseases from which women suffer so much. Send to Mrs. Lydia E. Pinkham, No. 233 Wetern Avenue, Lynn, Mass., for pamphlets. For sale by all druggists.

Burnett's Cocoaine promotes the growth of the Hair, and renders it dark and glossy. The COCOAINE holds, in a liquid form, a large proportion of deodorized COCOANUT OIL, prepared expressly for this purpose. No other compound possesses the peculiar properties which so exactly suit the various conditions of the human hair.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug 28, 1880.

BEANS AND PEAS.—The demand for beans has lulled again and there are sellers at inside rates for mediums and marrows. Other sorts fairly firm for choice. The bulk of red kidneys is weak as stock is liberal considering the approach to new crop. Peas generally quiet. Nominal rate for green Wisconsin, $1.60@1.65.

Marrow beans, prime, $1.63½@1.70; other, $1.50@1 60; medium, prime $1.45@1.47½; other, $1.35@1.40; pea, $1.50@1.70; white kidney, $1.70@1.85; red kidney, prime, $1.50; other, $1 35@1.45.

BROOM CORN.—Demand is moderate and prices unchanged.

Brush and short broom, choice, ₩ lb., 6@6½c.; do., do., common to good, 5@5½c.; hurl, good to choice, 6@6½c.; do., common to fair, 5@6c.; red and crooked at 3@4c.

BEESWAX.—A moderate amount of business and a steady market, with 24½@25c. quoted for Western and Southern.

Exports for week 3,519 lbs; since Jan. 1, 57,000 lbs; do. in '79, 41,050.

BUTTER.—The demand has been quite steady and prices have worked up a point or so, and the market closes with a wholesome tone of firmness. Contributing to the latter phase is a pretty solid export call. In this way a good deal of Western creamery has been moved at 25c., a good rate for wholesale business. A few marks of Western creamery now quote up to selected State. As before the average quality of State butter is good and this gives confidence to all classes of buyers. Western dairy and factory is turning out so satisfactorily and the under grades are rather pressed for sale. Fine Iowa June factory finds a ready place at 20c., and as a rule the range for Western is not so conflicting as is frequent during hot seasons. The weather has been severe upon the exhibition stock, but cool nights now help to restore the appearance of goods that have to be sold from the tryer.

Creamery, finest, 25½@27c.; good to prime, 25@26c.; fair to good, 24@24c.; sweet cream, 23@25c.; State firkins, 21@24c.; pails and half tubs, best, 24@25c.; fair to prime, 21@24c.; poor, 17@19c.; Welsh tubs, choice, 22@23c.; other, 19@21c.; Western imitation creamery, 17@22c.; dairy, fresh, 21@22c.; prime 20c.; poor to good, 16@19c.; factory, Iowa June 19½@20c.; fair to prime, 16@17c.; poor, 15c.

Receipts for week, 32,976 pkgs.; exports for week 13,825 pkgs.

CHEESE.—The market has been in very good shape most of the week, advancing to 13c. for best factories under moderate receipts, a good demand and the firmness displayed in the country. At the extreme close the arrivals were much larger and the feeling less firm; 13c. is still held for the best factories and sales made at that price, but there is an unwillingness to pay over 12¾c. The following are the quotations:

State factory, fancy, at 13c.; do. good and prime, 12@12½c.; do. fair to good, 11@12c.; do. half skimmed, 9½@10½c.; Wisconsin factory, fine, 12½@12¾c.; do. good to prime, 11½@12½c.; do. fair to good, 10¾@11¾c.; Ohio factory, fine, 11½@12¾c.; do. good to prime, 11@11½c.; do. flat, fair to good, 9¾@10¾c.; do. poor to fair, 8½@9¾c.

Receipts for week, 85,350 boxes.

Exports, 70,350 do.

Liverpool cable, 54s.

Steam, Liverpool, 45s.

COTTON.—The market has been variable and active, closing steady at for August, 12.09@12.10c.; September, 11.25@11.26c.; October, 10.70c.; November, 10.56@10.57c.; December, 10.56@10.58c.; January, 10.67@10.68c.; February, 10.81@10.82c.; March, 10 94@10.96c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

DRIED FRUITS.—Small fruits have been advancing under a good fall demand and moderate receipts. Apples are steady and in fair request. Quotations are for

Apples—Old State at 5¾@6½c, new Tennessee at 3½@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6@7c.; evaporated, ring cut, at 8½@9½c. Old peeled peaches at 5@11c. Blackberries at 7¾@7¾c. Raspberries at 26@26½c. Pitted cherries at 18¾@19c. Whortleberries at 10@11c.

Exports of apples for week, 590 bbls.

EGGS.—Receipts for week, 7,000 bbls.; do last week, 5,915 do. The market has had an irregular run, owing to hot, damaging weather. Previous high prices fell to 15½@16c. early in the week, but rates have since recovered. Supplies are light, few good lots in store and reasonably cool weather will be apt to steady quotations. Receivers report a good many losses during the genuine August weather that has prevailed.

Near points, 18½@19c.; State and Pa. 17½@18c.; Western and Canadian fresh 16½@17c.; off grades, 15½@16c.

FLOUR.—There has been a liberal business and prices steady.

Quotations are $3.30@4.00. for inferior to very choice superfine State and Western; $3 75@4 00 for poor to good extra State and Western, odd lots and lines; $4.00@4 25 for very good to choice do.; inferior to good white wheat extras, $4.50@5.25; good to choice do at $5.25@5.75; (very choice to fancy do. at $5.85@6.25,) red and amber winter wheat inferior to choice trade and family at $4.35@5.75; round hoop Ohio, $4 00@4.60; and trade and family brands of do. at $4.60@4.85; St. Louis at $4.50@5.25 for inferior to good extra; $5 20@5.85 for good to choice (and $5.90@6.25 for very choice to fancy brands); Minnesota clear, inferior to fancy at $3.85@6.25; Minnesota "straight," poor to fancy, at $5 75@7.25, and patent inferior to very fancy at $5.75@8.50; unsound stock at from $2 25@4 35; city mill extra at $5.30@5.50 for good to very choice for the West Indies; do. for England, $3.85@4.35 for poor to choice spring wheat, and $4.35@4.85 for winter wheat product; do. trade and family extras, $5.50@6.75; do. for South America, $5.50@5.75; No. 2 at $2.25@3.00 for poor to fancy.

Receipts for week, flour, bbls. 177,680, corn meal, do. 4,800; wheat, bush. 2,324,500; corn, do. 1,960,000, oats, do. 372,050; rye, do. 131,312; malt, do. 6,175; beans, do., 1,760; rice, pkgs, 916.

Exports for week, flour 69,600 bbls.; corn meal, 4,025 bbls.; wheat, 1,523,900 bush.; corn, 1,013,600 bush.; oats, 20,900 bush.; beans, 400 bush.; peas, 1,425 bush.; rice 1,310 pkgs.

CORN MEAL.—Sales at $3.20@3.25 for Brandywine, and $2.50@2.75 for yellow Western.

FRESH FRUITS.—Exports of apples for week, 4,314 bbls. Good hard stock has sold well for export; for other purposes the market is over supplied and easy rates prevail.

Fall pippins, $1@1.25; Alexander, $1.25@1.50; Coxsackie, $1.25@1.50; Maiden's blush, $1@1.50; Twenty oz., $1@1.50; Gravenstein, $1.25@1.50; Orange pippins, 50@75c.; Nyack pippins, 75c.@$1.25. Peaches are high for general trade but receipts have worked off well. N. J. extra, $1.25; plain to prime, 50c.@$1; Del. extra, $1.25@1 75; fair to prime, 60c.@$1; calls, 30@40c.; Upriver, 75c.@$1.25. It has been a rough week for pears and plums. Some lots sunk so badly that they would not make freight expenses. Bartlett pears, per bbl., choice, $5@5.50; common, $3@4; P. Beauty, $2 50@3; Duchess, $2.50@3.50; sour Bell, $2; cooking, $1.50@2; Quackenbush plums, per bbl., $5@5.50; Reine Claude, $4@5; Damson $3; egg, $4@5; green Gage, $3 50@5; Lombard, $1.50@2.50; blue Gage $3@3.50; purple egg, $3@4.50; Boston blue, $2@3; Bullet, $1.50@1.75. Grapes in good demand but very low, especially for loose; 50 lb. cases, Delawares, $4; do. Concords, $1.50@2.25; bulk and basket Delawares, 7@10c.; bulk Concords, 1½@3c. Hot-house grapes not wanted. Nutmeg melons, Hackensack, $1@1.25; Keyport, 25@75c. Watermelons, choice, large, per 100, $15@18; other, $7@12. Peanuts continue slow; hand-picked Va., 5@5½c.; extra prime, 4@4½c.; good to prime, 3½@4c.; common, 3@3½c.; shelled, 5@5½c.

GRAIN.—Wheat has been active and fluctuating in price. The Exports for the week have been 1,700,000 bush.

Latest prices are for No. 1 white at $1.08@1.08¼; do., August, at $1.08@1.08¼; do., September, at $1.07@1.07¼; do., October; at $1.07⅛@1.07¼; No. 2 white at $1.05¼@1.06; ungraded white at $1.01@1.09; No. 1 red at $1.10; No. 2 red at $1.08@1.08¼; do. August, at $1.07¼@1.08¼; do., September, at $1.07⅛@1.08; do., October, at 1.03¾@1.08¼; do. November, at $1.03@1.09⅛; do. steamer grade at 1.05¼@1.06; No. 3 red at $1.05¼@1.05¼; do., steamer grade, at $1.00¼@1.01; ungraded red at 95c.@$1.11; mixed winter at $1.05¼@1 06; No. 2 Chicago and Milwaukee spring at $1.01@1.05. Rye at 88c. for No. 2 Western for August delivery. Corn is active; the shipments for the week are 850,000; bush.; prices closed weak; latest sales are of New York No. 2, at 51¾@51¾c.; do., August, at 51¼@51½c.; do., September, at 51¾@51¾c.; do. October, at 52¾@52¾c.; do., November, at 53¼@53½c.; ungraded mixed Western at 50¾@51½c.; round yellow at 53c. bid and 55c. asked. Oats are offered freely at lower prices; sales of No. 1 white at 41c.; New York No. 2 white at 37½@38c.; No. 3 white at 35½@36c.; New York No. 1, 38c.; No. 2 at 37@37½c.; do., August, at 36½c.; do., September, at 31½c. bid and 35½c. asked; do., October, at 33c.; No. 3 at 35@35½c.; ungraded White Western at 37@40c.; ungraded mixed Western at 35@38c.; white State at 38@40c.; No. 2 Chicago at 38c.

HOPS.—New arrive more freely and are placed in small lots at 25 to 30c. Generally trade is dull. Quotations are for

	Cents per lb.
New Yorks, choice	25 @27
New Yorks, fair to medium	23 @24
Yearlings	7 @14
Olds, all growths	4 @ 8
Pacific Coast, new	23 @25
Pacific Coast, olds (nominal)	5 @ 8

HAY AND STRAW.—Demand is liberal and prices well sustained.

Shipping hay quoted at 75@80c.; medium to prime do., 90c.@$1.10; salt hay at 65@70c.; clover do. at 70@80c. Straw at 85@90c. for long rye; 55@65c. for short rye; and 65@70c. for oat.

Exports of hay for week, 3,550 bales. Since Jan. 1st, 32,400 do.; in '79, 51,300 do.

LEATHER.—Quotations are for light hemlock sole at at 22@23½; middle do. at 23½@25; heavy do. 22½@24.

OIL CAKE.—Western quoted at $29@29.50.

POULTRY AND GAME.—Dressed poultry is selling with unusual snap for this part of the year, but heavy receipts would swamp our wants. Chickens sell very profitably comparing rates for live. All shipments must be ice-packed.

Turkeys, prime small., 15c.; fair to good, 12@14c.; dry-picked, 14@16c. chickens, Phila., large, 17@18c.; small, 16@17c.; State and Western, scalded, 13@15c.; Fowls, Phila., dry-picked, 14@15c.; State and Jersey, 13@14½c.; scalded fowls 12@13c; Ducks small to large dry-picked 15@16c.; scalded 12½@13½c.; W. mixed 11@12c.; squabs white ₩ doz., $1.75; dark, $1@1.25.

There is a good demand for fowls and chicks chiefly for near points. Southern and Western are too thin to bring high prices. Ducks dull at the moment. Geese are active, many selling ahead for the Jewish holidays of Sept. 6 and 7.

Chickens, Jersey, ₩ lb., 13@13½c.; Western 10@11c.; Southern, 10@11c.; fowls, Jersey, 12c.; Western, 11c.; Southern, 10c.; roosters, 5@6c.; turkeys N. J. 12½@13c.; Western 11½@12c.; ducks, near by 55@75c.; other 35@45c.; geese, New Jersey $1.50@1.75; New York and Pa. $1.25@1.50; Western, $1 12@1.25; Southern, $1@1.13; pigeons, 20@35c.

Woodcock scarce and higher. No items of fine game are plenty enough to permit popular prices.

Woodcock, ₩ pair $1; English snipe $2@2.25; Grass plover, $2 50@3; stuffed pigeons, $1@1.25; small birds do not pay for catching, reed birds 20c.; blackbirds, 10c.

PROVISIONS—Have been less active and tending lower

Mess pork quoted at $15.65 bid and $15.75 asked for August; $15.70 bid and $15.80 asked for September; $15.75 bid and $15.80 asked for October. Bacon at 8¾@8¾c. for long clear. Beef hams at $20.50. Beef at for extra India mess $16.50 for city; $10 for extra mess, and $9 50 for plain mess; $10.50@11 for packet, and $11.50@12 for family mess. Lard at 8.15 for spot lots of Western steam; 8.10 for Sept. delivery; 8.17½@8.20 for October delivery. Stearine at 9c. for choice Western. Tallow at 6¾@6.7-16c. for prime.

Receipts for week, beef, 600 pkgs.; pork, 3,300 bbls.; cut meats, 10,425 pkgs.; lard, 12,746 pkgs.

Exports for week, beef, 1,825 pkgs.; pork, 3,250 bbls.; cutmeats 6,519,570 lbs.; lard, 3,163,200 lbs.

SEED.—Clover is strong; prime to choice quoted 8¼@8¾c. Flaxseed quoted at $1.32. Timothy is quoted at $2.50.

TOBACCO.—Export demand is fair and the home trade good with prices generally as last week.

VEGETABLES.—Exports of potatoes for week, 5,560 bbls. Potatoes are active but too abundant for dealers to mark up rates. In fact with choice rose selling at $1 50; other goods may be called weak.

Early rose, L. I. $1@1 50; N. J. $1@1 37; State $1.25@1.50; Peerless, $1@1.25; culls 50@60c. Sweet potatoes plenty and favor buyers. Del. River, $2.25@2.75; Va., $1.75@$2. Green Corn is of better quality and in good supply. Tomatoes show a large advance; the first crop nearly used up. Onions weaker. Green corn ₩ 100 50@75c.; tomatoes ₩ bush. 50@75c.; cucumbers pickles, per 1,000 $1@1 50; egg plant, per bbl., 50@75c.; string beans, per bag, 35@50c.; green peas $1.50@2; Lima beans, $1.50@2; flat do. 75c.@$1; turnips, 100 bunches, $2.50@3; Russia turnips ₩ bbl, 50@75c; beets, 100 bunches, $1.50@2; bullnose peppers, ₩ bag, 50@60c.; cabbage, ₩ 100 $5@7; red do., $6@8; squash, marrow, ₩ bbl. 50@75c.; onions, red, $2@2.25; carrots, ₩ 100 bunches, $1.50@2; okra, per 100, 15c.

WOOL.—The business has been slow again this week, and generally the position essentially unchanged,

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 28, 1880.

BEEVES.—Receipts for the week 13,127 head; do. last week, 13,164 do. A good style of trade has attended the market all the week. Fine quality, however, has induced considerable trade. The pick of the market was held and shipped by exporters. Texas cattle quoted 6¾@6¾c., to dress 65 lbs.; Colorados, 7c.; poor to fair natives, 7@8¾c., to dress 55@56 lbs.; good to strictly choice, 9@10¾c., to dress 55@57 lbs. A good many small State bulls were in market, selling slowly at 1¾@2¾c., live weight. Nearly 1,000 head of cattle sold at the close at 10@10¼c.

COWS AND CALVES.—It is almost a chance trade for cows and no revival is expected until cooler months are here. The grade of supplies now offering are of low order, the range for recent sales being $25@45, with now and then an extra milker at $50@55.

SHEEP AND LAMBS.—Receipts for week, 35 634 head; do. last week 29,947 do. Heavy general supplies have made easy prices. Fair qualities sheep 3½@4¾c; good to prime 5@5¾c. poor to prime lambs 3¾@5¾c.; a few choice 5¾@6c.

SWINE.—Receipts for the week, 26,225 head; do last week, 19 027 do. Western hogs quoted steady at $5.25@5.50 ₩ 100 lbs; State hogs have sold after holding at $5.45 ₩ 100 lbs. Market slow for lots outside of packers' supplies. City dressed quoted 7@7¾c.

VEAL CALVES.—The demand has ruled fair with noted prices strong for prime milk fed; common grades in buyers' favor.

Live calves, N. J. and Bucks Co., choice, 6@6½c., State fair to choice, 5@6½c.; poor, 3½@4½c.; Mt. Holly, heavy to light 5@6½c., buttermilk, 2@2¾c.; grassers 1¾@2c.

TERMS FOR 1880.

VICTORIOUS AT

Phila., 1876—Paris, 1878

25 Years in Use.

GUARANTEED SUPERIOR

To any other Windmill Made.

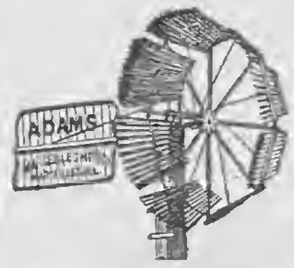
17 SIZES—1 MAN TO 45 HORSE POWER

Adopted by the leading R. R. Co.'s and by the U. S. Govt. at Forts and Garrisons.

$3,500,000 worth now in Use.

Send for Catalogue "B" and Price List.

U. S. WIND ENG. & PUMP CO., Batavia, Ill.



Adams Wind Mill

Works in a lighter breeze than any other. Governs itself perfectly. Its operation can not be interfered with by ice or sleet storms. Well made, Strong, Durable. Illustrated circulars of all our goods sent free. Address MARSEILLES MFG. CO., Marseilles, La Salle Co., Ill. Send for Catalogue "C."

CHALLENGE WIND MILLS

Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merit. Mills sent on 30 days' trial. Bost Feed Mills, Corn Shellers, &c., &c. Catalogue free.

CHALLENGE MILL CO., Batavia, Ill.

I. X. L. WIND MILL.

For Simplicity, Durability and Power *this mill has no equal.* It runs equally well in light or heavy winds. Ice and sleet do not affect it. Works well under all circumstances; never gets out of order. We warrant all our mills. Circulars and descriptive catalogues sent free on application to the Phelps & Bigelow Wind Mill Co., Kalamazoo, Mich.

IMPROVED CALIFORNIA WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers, CLARK & CO., SOMANAUK, ILL.

MAST, FOOS & CO.

SPRINGFIELD, O.

UNION STOCK YARDS, Chicago, Ill.

Our BONE MANURES stand without a rival for Wheat and Grass. Every Bag guaranteed. They are dry, and drill with regularity. ☞ *Send for Circulars.*

Reading for the Young.

A DIALOGUE FOR SCHOOL BOYS.

TOMMY.

If things were fixed to suit me
I'll tell you what I'd wish:
That all the boys had naught to do
But only play and fish.

LOUIS.

Oh, that would be so jolly,
I'd go right to the creek;
I think I'd ride on horseback,
I like to go so quick.

GEORGE.

I'll help to form the party,
We'll find a nice large tree,
And in the shade we'll stay and fish
As happy as can be.

CHARLEY.

And I will join you, too, boys,
To catch the bass and pike;
For baiting hooks, and watching "bites"
Is just the fun I like.

WILLIE.

I mean to take along a book,
To read, not idly wait
For fish, to nibble at my hook
And carry off the bait.

JOHN.

Boys, I believe we'd like it best
To work, and then to fish.
To seek to spend our lives at play,
Is not the wisest wish.

—SOPHIA C. GARRETT.

THE DRAGON FLY.

Here, here I watch them come—
The wild bee with his drum;
The tilting dragon fly with azure wing
The painted moths; and lo!
With his sharp, wiry bow.
The elbowed grasshopper with sudden spring
Setting the thickets brown in wild commotion.

This much abused "bird" which sometimes flies in at the open windows and frightens the young folks, is not a dangerous fellow by any means. His great name "The Devil's Darning Needle" is the worst thing about him, for he won't hurt you. You may take him in your hands and examine him as closely as you please, but don't hurt him.

A writer in the Worcester Spy gives an interesting sketch of the Dragon Fly. One of the most beautiful and beneficial insects of the Summer season, and one whose services are least appreciated by the agriculturist, is the common dragon fly. There are many varieties, comprising an extensive and beautiful group of large-sized insects, rivaling our butterflies in gracefulness of form and brilliancy of coloring, while they excel them in rapidity of flight. Various popular names have been given them in different countries. The French call them 'Demoiselles,' the Germans 'Gauze Flies,' and 'Virgins of the Water,' while among the English they are known as 'Dragon Flies,' 'Horse Stingers,' and 'Devil's Darning Needles.' The first of the English names is very appropriate to the character of the fly, for among other insects, it fully earns its title of 'Dragon.' It is not a 'horse stinger,' however, can neither bite, sting nor poison, and as a 'devil's darning needle' does not sew up the mouths of those children who are given to romancing. They are perfectly harmless to man, and can be handled without danger.

The dragon fly belongs to the order "Neuroptera" and the family "Libellulidæ." They have six legs and four wings. In average specimens the body attains the length of an inch and a half or two inches. They are almost universally dressed in the gayest colors. The body is variously banded with rich shades of blue, green and yellow, and the wings give off the most beautiful iridescent and metallic reflections. The substance of the wings is a delicate network, covered by a thin, transparent membrane, combining great strength with lightness, which enables it to fly and dart upon its prey with the greatest rapidity. The long tail, or "needle," undoubtedly acts as a rudder to steady its flight. The large head is provided with two enormous compound eyes, composed of many thousand facets, and their great power of vision is still further increased by three simple eyes, or ocelli, on the upper portion of the head. The mouth is quite a formidable structure. The upper lip is broad and conceals powerful toothed mandibles, and there are other organs of the mouth armed with strong teeth, which enable it to rend and masticate its food.

The natural term of life of the dragon fly is about one year. Most of its existence is passed in the water in the condition of larva or pupa, and it inhabits the air only three or four weeks. In the water he appears like a large water bug or worm, with large eyes and six legs, and lives on the bottom of ponds, where he catches small fish or any similar thing for his food.

When about to complete its final transformation the pupa climbs up some suitable place near the water, attaches itself firmly to some object, and in a short time the skin opens along the back, and from the rent there soon appears the perfect dragon fly, which, after drying its moist wings, trusts its untried pinions with the fullest confidence to the new element, in which it lives but a few short summer days.

Tennyson beautifully describes these changes in the "Two Voices":

"To-day I saw the dragon fly
Come from the wells where he did lie.
An inner impulse rent the veil
Of his old husk; from head to tail
Came out clear plates of sapphire mail.
He dried his wings; like gauze they grew;
Through crofts and pastures wet with dew
A living flash of light he flew."

During its existence of three or four weeks above the water its whole life is a continued good to man. It hawks over pools and fields and through gardens, decimating swamps of mosquitoes, flies, gnats, and other baneful insects. Their rapid flight and enormous range of vision enable them to capture these insects with ease. They destroy multitudes of moths and millers whose larvæ are injurious to vegetation, while they do not injure any product of the agriculturist themselves. A few of them shut into a house would soon rid it of flies, bugs and mosquitoes. They are perfectly harmless, and can be handled with impunity, and are an interesting subject for study, as there still remains much to be learned of their natural history. The dragon fly is widely distributed over all parts of the globe, but few, however, exceed in size and beauty those of our own country.

LIONESS AND RATS.

An old lioness recently died at the Dublin Zoological gardens, and a correspondent in referring to the occurrence, says that the closing weeks of her useful life were marked by a touching incident worthy of being recorded. The large cats, or carnivores, when in health, have no objection to the presence of rats in their cages. On the contrary, they rather welcome them as a relief to the monotony of existence, which constitutes the chief trial of a wild animal in confinement. Thus, it is a common sight to see half a dozen rats gnawing the bones off which the lions have dined, while the satisfied carnivores look on contentedly, giving the poor rats an occasional look with their sleepy eyes. In illness the case is different, for the ungrateful rats begin to nibble the toes of the lord of the forest before his death, and add considerably to his discomfort. To save our lioness from this annoyance, we placed in her cage a fine little rat and tan-terrier, who was at first received with a surly growl, but when the first rat appeared, and the lioness saw the little terrier toss him in the air, catching him with professional skill across the loins with a snap as he came down, she began to understand what the terrier was for; she coaxed him to her side, folded her paw around him, and each night the terrier slept at the breast of the lioness, enfolded with her paws, and watching that his natural enemies did not disturb the natural rest of his mistress. The rats had a bad time during those six weeks.

A SCHOOL BOY'S VACATION.

A Cambridge boy, after a week's absence in the country, wrote to his mother: "I got here all right and I forgot to write before; it is a very nice place to have fun. A feller and I went out in a boat and the boat tipped over and a man got me out and I was so full of water I didn't know nothin' for a good long while. The other boy has got to be buried after they find him. His mother come from Chelsea and she cries all the time. A hoss kicked me over and I have got to have some money to pay a doctor for fixing my head. We are going to set an old barn on fire to-night and I should smile if we don't have bully fun. I lost my watch and am very sorry. I shall bring home some mud turkles and I shall bring home a tame woodchuck if I can get 'em in my trunk."

A LITTLE BOY'S COMPOSITION.

One day our dog Towser was a lyin' in the sun a trine to sleep, but the flies was that bad he couldn't cos he had to catch 'em, and bimeby a bee lit on his head and was workin' about like the dog was his'n. Towser he held his head still, and when the bee was close to his nose, Towser winked at me like he sed, you see what this buffer is doin'; he thinks I am a lily of the valley which isn't opened yet, but you just wait till I blossom, and he opened his mouth very slow so as not to friten the bee, and the bee went into Towser's mouth. Then Towser shet his eyes and his mouth too, and began to make a peaceful smile wen the bee stung him, and you never see a lily of the valley ack so in your life.

A FASTING CHICKEN.

Some one says that any chicken can do what Dr. Tanner did and to prove it tells the following story: An Albanian in Albany missed a fine young chicken from his poultry-yard a month ago, as his wife was having some refuse taken out of the yard, an old bucket, which had not been in use for some time, was overturned. Underneath the bucket was the young fowl. It had been caught in the trap, and been without food and water over twenty-four days. The chicken looked emaciated, and seemed depressed in spirits. Pulse normal, temperature normal, sphygmographic tracings weak and irregular, muscular pressure undetermined. The feathered faster was given feed in judicious quantities, and has already recovered its general sprightliness.

LETTERS FROM THE COUSINS.

Dear Uncle Mark:—I don't quite understand what your "Horticultural Club" is, and I wonder what all the "cousins" mean when they talk about seed. I am a little stranger you see, but I like to read the "letters from the cousins" and I think I would like to become a member and write too. I wonder if most of the other girls and boys do not live out among the green fields, where the birds sing and the dear little brooks bubble along over the pretty stones, and how clear and bright the pebbles do look when in the water, so much nicer than they do after they are dry. I suppose these country cousins have lots of interesting things which we in the city cannot have. I suppose they have a big shepherd dog, whose name is Prince, and a great maltese cat that they call Snip, and lots of funny ducks and chickens; that is what cousin Genie has out on the farm, but we don't have them in the city. I could tell you lots of stories of little children that live in cities and don't have such nice times. Don't have any papa and mamma and not even a nice tumbler of milk at bed time. I could tell you of long rides in the cars and how we went out to sea—a little way—and the hand-organ man that had the cute monkey dressed like a soldier, and if Uncle Mark will send me some seeds I will plant them in my "sky garden," and tell you all about them, and where the garden is. And the little, little beggar girl that slept in a box all one cold Winter night. Now I guess I will stop. I think I will wait and see if there is room for me. I am only ten years old, just ten yesterday, but I would like to tell you how mamma and I make plants grow. I think if your seeds do not come up that the soil or temperature was not right. Georgia G. Smith.

Dear Uncle Mark:—I guess you will think that we have forgotten to thank you for the seeds that you sent us, but we have not. We sowed the pinks and portulacas in a box. They are all in blossom now. The pinks are just splendid, 35 varieties; the most of them are double, but the portulacas are all single. The rest of the seed we did not sow. We have not many flowers this year. We have 11 geraniums. Our grape seeds are not up yet. Every seed of the melons came up and are very nice; we picked two yesterday, they were splendid. We have got a little baby sister and her name is Faith. She is just as cunning as she can be. She is two months old tomorrow; when may she join the club? Good-bye. Your affectionate nieces,

Bertha and Ettie Robbins.

Oswego Co., N. Y.

[We add the name of your little sister to the club. She is the youngest member. U. M.]

Dear Uncle Mark:—I take my pen to report what success Clara and I have with the seeds you so kindly sent us. Ma planted the phlox, and pinks, and okra seeds in the house in boxes, and we now have fourteen plants of phlox in blossom, and a nice bed of pinks all budded, and there is one in blossom, and I wish to know if they will remain out all Winter without harm. Our musk-melons grow nicely and now have quite large fruit on the vines, but I cannot tell how good they are for none have yet got ripe so that I could have a taste. We will try and do better with our beds next year, and hope we may have better luck so we can give a better report next Fall. We hope you will not forget us in your next seed distribution. Thankfully yours, H. & C. Jones.

Steuben Co., N. Y.

[These plants are hardy. They may, however, be covered with mulch at the beginning of cold weather. U. M.]

Dear Uncle Mark:—As I had nothing better to do, I thought I would write and tell you of my success with my seeds. I had very bad luck with them, I can assure you. Only the okra, mignonette, portulaca, pinks, phlox, and musk melons came up. Father sowed the oats, but they are only about a foot and a half high. He did not sow the peas, as they will not ripen here. I agree with Alma Allen in thinking that it would be nice for the cousins to correspond with each other. But I must close, or this will go into the waste-basket. Your niece, Fanny Horne.

Wolfe Island, Ontario.

Dear Uncle Mark:—I am a little girl eleven years old. I live in Dakota. My father takes the Rural, and I like it real well. I like to read the letters, and I want to join your society. I mean to have a garden next year, and will you please remember me when you send your seeds? I have never raised many flowers, but I am going to try next year. Hattie Stone.

Dakota.

Dear Uncle Mark:—My flowers have come up well and are growing nicely, and we like them very much. We have a great many flowers. The musk-melon vines have quite large melons on them. The pinks and portulacas and Sweet Mignonettes are nice. I have saved some seed from the portulaca. K. F. Dodge.

Lewis Co., N. Y.

Sabbath Reading.

THE UPWARD FLIGHT.

Are we almost there?
Have we scaled the hight!
Are those the home lights which gleam afar?
Have we bade farewell to the shadowy night,
And entered the realm of the morning star?

Faint to my ear comes the sound of earth,
Her wail of anguish and wild despair;
The hollow ring of her hollow mirth
Are lost in the depths of this upper air.

And now a breath, like the breath of morn,
A light, a radiance, spreads around,
And forms of that mystic radiance born,
Seem floating hither with glory crowned.

O angel! lend thy sheltering wing—
I see the portals of light unrolled.
With songs of welcome their arches ring—
The ransomed are safe in the heavenly fold.

Laura S. Hagner.

OUR SAVIOUR.

Throughout the Bible run two great lines of thought, the one leading up to the sufferings of Christ, the other to the glory that should follow. The one series speaks of a mysterious pain and anguish, beyond human thought to fathom; the other points to a glory of kingship, a jubilance of triumph also surpassing all that man has conceived. The two lines sometimes run parallel, sometimes cross each other, and in the prophecies of Isaiah both converge to a point. The "Man of sorrows and acquainted with grief," is yet "the King in his beauty." To that Divine poem of contradictions the first chapter of the Epistle to the Hebrews is the key, telling of one who, "when he had by himself purged our sins, sat down on the right hand of the Majesty on high," "whose throne is for ever and ever." The one great hope of existence is, that the Lord who died is Ruler and Worker. He in whom all things subsist is the centre of the Universe; his Cross is the explanation of all its secrets The ascension meant this; hence the importance attached to it in apostolic teaching, or rather to that glorification of the risen Christ of which it was the sign. The epistles to the Ephesians and the Colossians are one grand amplification of this theme.

Our Lord's appearances after the resurrection had assured the disciples of the reality of his glorified life. The intercourse was sufficient to bridge what would otherwise have been an impassable gulf between their remembrance of his earthly life and their thought of him at the Father's right hand. The cross, the grave, had but left upon him the marks of a love deeper than death. So the cloud which received him out of their sight did not hide him from their consciousness. Fain would they, as we, have looked behind that cloud, following the track of his glory, until the portals of heaven opened in answer to the triumphant cry, "Lift up your heads, O ye gates, and be ye lifted up, ye everlasting doors, and the King of Glory shall come in." But it is an angel's voice that recalls to earth, and in thought we gather rather with that little band who, in the upper chamber, continued with one accord in prayer and supplication, and there were endued with power from on high.

Pentecost is the true interpretation of the Saviour's ascension. The Spirit was now given, because Jesus was now glorified. Yet was it but an earnest of blessing—the feast of first-fruits; the feast of ingathering is yet to be. The ascension proclaimed, emphatically, every barrier between God and man is swept away, Freely can his life now be imparted. Even Calvary had the Lord endured, rather than that we should be cut off from that life. The Cross is the measure of his longing to bless. Through all, over all, that opposed would his love find its way to us. Yet we seek him doubtfully, yet we trust him tremblingly.

Why should we remain sorrowful, when we have but to ask and receive that our joy may be full? When he has cast down every obstacle, shall we erect others? It is possible that our unbelief may thwart the purposes of the love that even the cross could not baffle.

"He has received gifts for men," gifts without reserve. God never gives by halves. Is it a scanty, measured life that gladdens us in spring? Can we tread five steps on an April day without finding that we have not faculties sufficient to take in even the dimmed and narrowed glory that comes to us as we pass along the streets? Through some rift in the stony gloom we catch a ray of the beauty, a glimpse of the freshness, a breath of the fragrance, a note of the songs, and we feel as if even that were enough to last us for evermore. But more easily might we count the leaf-buds, or number the sunbeams, than measure the infinitude of gifts the ascended Saviour waits to pour out upon us.

Once more, Christ's ascension is not only *for* us; it is ours. We may know a present daily ascension with him, which is to us the pledge of love.

If life be a battle, how mad must he be who fails to arm himself for the contest! If life be a storm, how infatuated is he who sleeps while his bark is driven among unknown waters! If life be a pilgrimage, how unwise is he who strays from the right road, nor seeks to return till the twilight shadows gather around his pathway!

The characters of Christians differ. It is the peculiarity of the life of the Saviour to impart different gifts, and a different selection of gifts to different believers, so that while all have a family likeness to the Master, yet they are not "like to like," but "like in difference."—Rev. Charles Butcher, D. D.

There is no portion of our time that is our time, and the rest God's; there is no portion of money that is our money, and the rest God's money. It is all His; He made it all, gives it all, and He has simply trusted it to us for His service. A servant has two purses, the master's and his own; but we have only one.—Monod.

Where science speaks of improvement, Christianity speaks of renovation; where science speaks of development, Christianity speaks of sanctification; where science speaks of progress, Christianity speaks of perfection.—J. O. Thompson.

Earthly glory soon vanishes; earthly possessions pass away—a few years and all are gone. But the promises of God remain unto us until the end of all things; heaven rests on eternity. It may be ours if we seek it aright.

You may depend upon it that enthusiasm is a liberal education for a Christian; I mean nothing makes a man so quick-sighted and intelligent in the service of God as enthusiasm—Spurgeon.

Every year of our lives we grow more convinced that it is the wisest and best to fix our attention on the beautiful and the good, and dwell as little as possible on the evil and the false.

Do you believe in God? Dare you not trust yourself like a child to Him? What is your belief worth if it has not taught you that blessed central truth of all—that He is your Father?

God is immortal; goodness is immortal and therefore his servants shall not perish; they shall shine as stars forevor and ever.

He who is not affectionate to God's creatures and to his own children, God will not be affectionate to him.—Mohammed.

PERSONAL ITEMS.

Liszt says his pen is tired, and that he will compose no more.

It is said that it cost the New York Herald $1,600 to watch Tanner.

The Prince of Wales' life is insured for $200,000. His annual premium on this sum is $4,000.

The Earl of Eldon, grandson of the penurious Chancellor, has just built a church at a cost of $200,000.

"Adirondack" Murray has returned from Europe and is forming a company for the export of butter.

The New York Sun suggests that Mr. George W. Childs' new house at Bryn Mawr be named "Obituaria."

The Empress of Austria is a good fencer. She ought to go out West where there are lots of fencing to be done.

Cardinal Nina, the Papal Secretary of State, has had an attack of fever and probably will have to court repose and retirement for some time.

Notwithstanding his impoverished treasury the Sultan gave Lady Layard a diamond worth $35,000 on her departure from Constantinople.

General Grant told a Denver reporter the other day that he has not accepted the presidency of the mining company recently offered to him.

Prince Roland Bonaparte, who is now the poorest of his race, being, in fact, almost penniless, after he marries the young heiress of Monaco will become the richest Bonaparte of all.

While moving a log recently, Milo Parsons, of Northville, Conn., found himself suddenly covered from head to foot with hornets. Want of space forbids the publication of his remarks.

Lady Burdett-Coutts is described as being rather large and having white hair and a slightly florid complexion. It is confidently denied and stoutly affirmed that she is going to be married.

KIDNEY-WORT

The Only Medicine

That Acts at the Same Time on

The Liver, the Bowels and the Kidneys.

These great organs are the natural cleansers of the system. If they work well, health will be perfect; if they become clogged, dreadful diseases are sure to follow with

TERRIBLE SUFFERING.

Biliousness, Headache, Dyspepsia, Jaundice, Constipation and Piles, or Kidney Complaints, Gravel, Diabetes, or Rheumatic Pains and Aches,

are developed because the blood is poisoned with the humors that should have been expelled naturally.

KIDNEY-WORT

will restore the healthy action and all these destroying evils will be banished; neglect them and you will live but to suffer.

Thousands have been cured. Try it and you will add one more to the number. Take it and health will once more gladden your heart.

Why Suffer longer from the torment of an Aching back? Why bear such distress from Constipation and Piles?

KIDNEY-WORT will cure you. Try a package at once and be satisfied.

It is a dry vegetable compound and

One Package makes six quarts of Medicine.

Your Druggist has it, or will get it for you. Insist upon having it. Price, $1.00.

FREE TO ALL!

Wishing to introduce our great Literary and Family Journal, **The Fireside at Home** (a mammoth 8-page, 40-column *Illustrated paper, size of N. Y. Ledger*), devoted to Literature, Useful Knowledge, Amusement, and everything to delight and instruct the whole family) into thousands of new homes where it is not already taken, we will send it **Free for Three Months** to all who send **Ten Cents** (in silver or postage stamps) to pay postage and help pay the cost of this advertisement. The regular price is $1.00 per year, but we are willing to give the paper away for three months and lose its cost in order to introduce it to new readers. By taking advantage of this offer you will secure all the brilliant holiday issues and enlarged numbers soon to be published, and an amount of valuable and attractive reading matter for the approaching **Long Winter Evenings**, which could be secured in no other way for four times the amount. **Send at once**, and if you can conscientiously say, after your subscription has expired, that you have not received double the value of the ten cents—yes, and more—we will make you a present of a $1.00 bill. Address:

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

TANNER'S stomach now works in its shirt sleeves. Its coats are all worn out.

IF you find it impossible to raise grass in your yard just lay it out in beds and plant garden seed. Grass will come up then.

THIS is the season of the year when the average tourist is reported as returning home "as brown as a berry." By the bye, what kind of a berry is it that's brown?

"Och, said a love sick Hibernian, what a recreation it is to be dying of love! It sets the heart aching so delicately there's no taking a wink of slape for the pleasure of the pain."

No woman, however nervous, has a right to wake up her husband from a sound sleep to tell him, on inquiring what's the matter, "Nothing, only I wanted to know if you were awake."

THE negro's definition of bigotry is as good and as inclusive as that of Webster's Dictionary. "A bigot!" said he, "why he is a man who knows too much for one and not quite enough for two."

"WILL you have some strawberries?" asked a lady of a guest. "Yes, madam; I eat strawberries with enthusiasm" "Do tell! We haven't anything but cream and sugar for them this evening."

A FASHION paper states that French heels are not worn as much as they were last season. The French are a peculiar people. But when it comes to cutting their heels off for fashion's sake, it's simply awful.

NOT long ago a new railway was opened in the Highlands. A Highlander named Donald heard of it, and bought a ticket for the first excursion. The train was about half the distance to the next station when a collision took place, and poor Donald was thrown unceremoniously into a park. After recovering his sense he made the best of his way home, when the neighbors asked him how he liked his drive. "Oh," replied Donald, "she liked it fine, but they had an awfu' quick way in puttin' me oot."

Nothing Wrecks the Constitution

More effectually than fever and ague. That nerve destroying malady, when once it takes firm root, subverts every function, exhausts the physical energies, impoverishes the blood and clouds the mental faculties. No effectual resistance can be offered to its destructive career by the use of the pernicious drug, quinine. Hostetter's Bitters will, however, be found all sufficient either for its eradication or prevention. Those conditions of the system, such as a bilious, constipated habit, or lack of vitality, which are favorable to the contraction of the disease, are speedily reformed by this pure and efficient alterative and invigorant, which not only regulates the system, but gives a healthful impulse to the various organs, whose activity is the best guaranty of health. Thoroughness of action is the relief characteristic of this leading specific and preventive, which is eminently adapted for family use.

THE BEST AND THE WORST.

Robinson—"You have seen more of the world than most people, Mrs. Smart. Now, where have you met the handsomest, pleasantest, and best bred people?"

Fair American—"Well, among your British aristocracy."

Robinson—"Indeed! That is most gratifying to my pride as an Englishman! And where have you encountered—a—the ugliest, vulgarest, and most offensive specimens of humanity?"

Fair American—"Well—among your British aristocracy."

The Literary Revolution.

In January, 1879, The Literary Revolution was inaugurated by the publication of one small volume. In September, 1880, its list, published and in preparation, comprises over 120 volumes of standard books. It gives employment to about 500 hands, is actually delivering to purchasers over three tons of books a day, or over 1,000 tons a year, and is so far from able to fill all orders that additional buildings have just been leased, machinery purchased, and other steps necessary taken to double the present product within the next sixty days. To meet the popular demand for the coming twelve months at least 2,000,000 and probably 3,000,000 volumes will be required. The almost wonderful success which the Revolution has achieved is doubtless to be attributed to its leading principles, which are: I. Publish only books of real merit. II. What is worth reading is worth preserving—all books are neatly and strongly bound. III. Work on the basis of the present cost of making books, which is very much less than it was a few years ago. IV. Books have commonly been considered luxuries; in a free republic they ought to be considered necessities, and the masses will buy good books by the million if prices are placed within reach. V. To make $1.00 and a friend is better than to make $5.00 only, and 1000 books sold at a profit of $1.00 each gives a profit of only $1,000, while 1,000,000 books sold at a profit of one cent each gives a profit of $10,000; and it is more pleasure as well as more profit to sell the million. The most important publication thus far undertaken—indeed the most important work ever published in this country—a work that every intelligent person wants in his library, is the Library of Universal Knowledge. It is a verbatim reprint of the last London edition of Chambers's Encyclopedia, with copious additions by American editors, about 15,000 topics being added to the original work. It will contain, complete, about 10 per cent more than Appleton's and 20 per cent more than Johnson's Cyclopedia, though costing but a fraction of the price of either. The publication of a large type edition of the Library of Universal Knowledge is just begun, vol. I. being issued September 1. Two or more volumes will be issued each month till the whole is completed in 15 vols octavo of nearly 1,000 pages each. The price of the large type edition in cloth binding is $1.00 per volume; bound in half Russia, gilt top, price $1.50 per volume. According to our usual custom, special reduction in price is made to early purchasers, and during the month of September only orders for volumes I., II., or III., either or all, will be received at the nominal price of 65 cents per volume for the cloth, 95 cents per volume for the half Russia, gilt top. As a portion of the Library of Universal Knowledge, the Chambers's Encyclopedia is also published separately, complete in 15 volumes of clear nonpareil type, and sold, bound in cloth, for the nominal price of $7.50, or in half Russia, gilt top, for $15.00. In this style 12 vols. have already been issued, vol. 13 will be ready September 10, and Vols. 14 and 15 a few days thereafter. On this also special terms are given to early purchasers, the price being to those whose orders are received during September $6.75 for the set complete in cloth, $13.50 for the half Russia gilt top. The volumes already issued will be sent at once by express, and the remainder when completed in October. The Revolution is always undertaking new enterprises and according September in Religion we plishing new victories. Our "Analytical Concordance to the Bible," the great "Webster Unabridged" of religious literature, and a 50 cent edition of of Smith's Bible Dictionary. expect to complete Young's In Biography, two volumes added to our Acme Library of Biography con- tain 10 vols. selected from the famous English Men of Letters series, at little more than one-tenth the cost heretofore. In Poetry we shall soon have the Iliad and the Odyssey of Homer, translated by Pope, and a large type edition of Shakespeare. In History a cheap edition of the celebrated Froissart's Chronicles, with over 120 illustrations. In Fiction, Scott's "Ivanhoe" and Bulwer's "Last Days of Pompeii." In Juvenile, "Karl in Queerland," profusely illustrated. The cost of making books diminishes in large degree as their number is multiplied. Many of our books are selling in so much larger quantities than we anticipated that we find it in our power to considerably reduce their prices, and we do it with a great deal of pleasure. Among those so reduced are the histories of Macaulay and Gibbon, Taine, Rollin, Josephus, Modern Classics, Milton, Virgil, Dante, Koran, Bunyan, Crusoe, and several others.

BIRD'S EYE VIEW OF THE EXPERIMENT FARM OF THE RURAL NEW-YORKER.—80 ACRES.

Farm Topics.

THE RURAL NEW-YORKER FARM.

PETER B. MEAD.

A VISIT to the RURAL NEW-YORKER Farm during mid-summer proved to be a source of much pleasure and profit, and impressed me strongly with its great value to the whole agricultural community. Inasmuch as this farm is devoted chiefly to the interests of the readers of the RURAL, I have thought that a brief allusion to what is being done there would interest them.

The farm, consisting of about 80 acres, is located at Rockaway, L. I., directly opposite the new mammoth hotel on Long Beach, as may be seen by the first-page sketch. The soil is a light, sandy loam, easy to work. The farm is divided by substantial fences into lots of convenient size, all of which open into lanes on either side, and these again connect with a road leading to the farm buildings, which are centrally and conveniently located. These buildings are roomy and substantial, and arranged with reference to economy in time and labor. A well-furnished work-shop prevents much idleness on rainy days, and saves many a step to the village.

I was not disappointed in seeing a great variety of farm implements. These are about as important factors in experimental farming as seeds or manures. Naturally, some of these had been tried, found wanting, and laid aside. A slight improvement in others would double their value.

The dwelling may be seen on the right hand of the picture. It is covered with a hospitable roof, and the spirit of content dwells within, with an added charm from the hostess, who seems to possess naturally the gift inherited by her little daughter, who entertained me in the most delightful manner, which the reader will the better understand when he is told that I am quite deaf. The house fronts on the public road, and is surrounded by evergreen and deciduous trees and flowering shrubs, with a few beds of flowers that give life and expression to the lawn. In the house plot are the principal fruits grown on the place, such as apples, pears, peaches, grapes, etc. all of which are here neglected as the Experimental Grounds for fruits are located 40 miles distant in New Jersey.

A few words next in explanation of the letters in the engraving. W. denotes the wheat lots; C. corn lots; P, pasture lots. In the middle of this lot is a circular cluster of large trees surrounding a pool of water, where the cattle find both shelter and drink. V. Exp't is a plot devoted to the trial of various kinds of vegetables, especially new kinds as they appear. W. Exp't is a plot where experiments in wheat were made. P. O., on the right, is the experimental lot for potatoes, adjoining which is the oat lot where an immense yield of Mold's Ennobled oats is in shock. South of the potato lot are eleven kinds of cow-peas under trial, as well as many varieties of sorghum, beans, melons, etc. Expt. on the left of the farm buildings is a lot for various experimental purposes, such as growing corn and sorghum for soiling, etc. Finally, the M's may mean either meadows or mosquitoes, or both, and there seemed to be quite as much of one as the other, if not more How they did bite! and yet the Editor who accompanied me bore their attacks with the meekness of a lamb. There is nothing like getting used to a thing. As a pleasant offset to the mosquitoes, a portion of the meadows was gay with wild flowers, conspicuous among which were great masses of Lilium superbum, grandly colored.

One of the most prominent features of the farm is the testing of wheat, of which a great many kinds are grown, and in which important improvements have been made. For example, from shriveled grains of Spring Defiance, sown two successive seasons in the Fall, we have the Rural New-Yorker Winter Defiance, the largest heads of which I found to measure seven inches and a quarter in length, the average being five inches and a half. Results almost as remarkable have been produced with other kinds. Experiments in wheat growing include not only the comparison of kinds and their improvement, but the comparative value of manures, drilling and sowing broadcast, and, in short, everything that is necessary to be known to form an intelligent opinion of the value of kinds, manures and culture. The value of these experiments to the wheat grower is very great indeed.

Another important feature is the testing of varieties of corn; and it is well that so much space, time, and labor should be given to the staple products of the farm. The growing crop of corn at the RURAL FARM is something remarkable. I have been on many committees to examine corn in the field, and have grown some pretty good crops myself, but I have never seen anything to equal the crop of Blount's Prolific at the RURAL FARM; and this, too, after an almost unprecedented drought. It was sown in drills, and the stalks are about fifteen inches apart. I was much pleased to see that flat culture has been adopted here. It helps wonderfully to carry a crop through a severe drought. The field was as flat as the top of a table, every stalk erect and no weeds to be seen. I found some of the stalks to be already eleven feet high, with a still further growth to be made. Many of the stalks had from seven to nine ears, and very few less than four. Where some of the stalks have tillered, I think that fifteen and more ears will be got from a single grain of corn. The reader who has time can calculate how many-fold the yield will be. A good deal of enthusiasm would have been quite pardonable in that field of corn, and it has been rather difficult for me to write soberly about it.

Much attention is also given to potatoes, more than sixty kinds being on trial, many of them not having yet been offered for sale. There are several varieties of sweet potatoes under trial. Sorghum has also received much attention. From a single seed from a variety named Rural Branching Sorghum I counted eighteen stalks.

There are other plots set apart for experiments with millets, roots, cabbage, pumpkins, melons, beans, and other things important to the farmer and the gardener, and to which I can only make this brief allusion. A careful record is kept of each crop and experiment, and the results, I presume, will be laid before the reader in due time.

An effort is now being made to establish an "Experimental Station" for the State of New York. Here at the RURAL FARM we have one already established by private enterprise, which is a model of its kind, and might be appropriately recognized by the State as a substation, though I imagine that the Editor will prefer to go on unhampered in his own way. The testing of the chief farm crops of the country, the comparative value of manures and artificial fertilizers, the trial of improved and labor-saving farm implements, the importance of thorough and clean culture, the rotation of crops, and other matters pertaining to successful and profitable farming, all receive that thoughtful care which is necessary to obtain reliable and useful results. All this, be it remembered, is done for the benefit of the readers of the RURAL NEW-YORKER, though its benefits are by no means confined to them. Its influence may already be seen in the neighboring farms, and will in time become widely extended. In view of what is being done here, I cannot help wishing that both the FARM and the RURAL may receive the continued appreciation and support they so well deserve from all engaged in rural pursuits.

AMERICAN AGRICULTURE.

EX GOV. ROB'T. W. FURNAS OF NEBRASKA.

PROFESSOR Johnson, in one of his admirable lectures on the application of chemistry and geology to agriculture, speaking of the importance of agriculture, in substance says: "On it a thousand million of people are dependent for their very sustenance; in its prosecution nine-tenths of the fixed capital of all civilized nations is embarked; on it two hundred millions expend their daily toil." To which add another agricultural axiom, that: "the grand aim of the tiller of the soil should be, to obtain the largest possible yield, with the least possible expenditure of human toil." These enunciations comprehended, we have proper conceptions of the importance of agriculture to the whole world, as well as of the importance of the employment of skilled, scientific labor, manipulation and management. A prevalent idea has been—and is yet, to some extent—that the individual possessed of sufficient physical, or animal force and power to plow and hoe, can make a good farmer. The horse and ox, however, are more abundantly endowed with these qualifications naturally, than man; yet are mere machines and worthless in reality, without the brain guidance of the more intelligent beings.

I am of those who maintain that more men reach a medium of this world's goods, comforts and enjoyments on the farm, under even existing adverse circumstances and surroundings, than in any other occupation. There is, nevertheless, a lack of corresponding remuneration, accumulation, and consequent enlightenment, as compared with other vocations, for which there is cause. So long as the patrons and matrons of husbandry insist on giving their brightest sons to the professions, and the dullest to agriculture, just so long will there be "shortage" in the respects named. The less informed will continue the prey of the better informed.

Farmers complain that they are not proportionately and justly represented in the law-making departments of government machinery. True: and simply because of their deficiency in the requisite qualification, growing largely out of the policy of assigning the boys of lower mental caliber to agricultural pursuits. The remedy for this lies to some extent in education, by which labor will be honored, and in the adornment of farms and farm houses, by which they will be rendered more attractive and desirable.

There is not, however, so much real cause for complaint now as in times gone by. To-day American agriculture stands higher than ever before; our products are in greater demand; more of our bread and meat, the great standard life foods, go to feed the Old World. Our surplus increases. The balance of trade is in our favor; our precious metal products have been, and are still, greatly on the increase. In the shape of purchasing medium, or power, for years past, until recently, they have gone abroad; now, with an advancement in agriculture and consequent increased surplus, they come home, and to stay. General prosperity reigns supreme. Surely the outlook for American farmers is bright.

WHAT AGRICULTURE HAS DONE AND WHAT IMPROVED AGRICULTURE MAY DO.

B. F. JOHNSON.

DULY sensible that a prosperous agriculture and abounding crops had been mainly instrumental in making specie resumption possible, in 1879 one of the leading New York city dailies made the naive confession, in summing up the surprising results of the year, that for the first time in the history of the country had just and proper credit been given to the farmer for his part of the work of the sustentation of the public credit," and for the first time had the acknowledgment been made that the rehabilitation of the country was largely due to a prosperous agriculture. So much having been already confessed to have been done in the past, we may look forward to the future and prefigure its possibilities in the agricultural line.

In the first place, it is pretty evident the keenest and sharpest among business, if not among thinking men, are being drawn to the vast importance of the subject of agricultural progress and development, and that the profoundest intellects of our time are about to take that interest in the great calling which distinguished the earlier and later fathers of the Republic—Washington and Jefferson and their contemporaries; Clay, Webster and Cass and theirs. And it is a curious and an interesting fact that those among men remarkable for their intellectual ability and profound insight and to whom the world gives the highest positions, have been not only the firm friends but the enthusiastic supporters of agriculture, and have given the best efforts of their minds in that direction. Such and so minded was Julius Cæsar, of antiquity; such, Bacon of the later Middle Ages, and such the first Napoleon and Webster of our own time. If we do not care to name those among the living who are truly great and who show that greatness by their devotion to agricultural progress, it is because few men are great in the estimation of their contemporaries—time only affording that perspective by which we are able to make our just and accurate judgment of men.

But if the best interests and professional intellects are giving their attention to the importance of agricultural progress, the scientists, in the second place, are no less active and devoted, and from present appearances we seem to be likely to have reproduced here the scientific experiments in the same or a similar line which abroad have done so much to relieve farmers of the thousand and one uncertainties which surround the calling and degrade the profession of farming. To be sure, the agricultural colleges have mostly failed in their missions, but this is because they fell (for the want of abler and better) into the hands of pedagogues who are the hereditary enemies of agriculture and have been so since Aristotle, the first great pedagogue, declared his scorn of all labor, and Seneca, the great teacher of morals, repeated and emphasized that scorn. The creation of a few such experimental stations as that of Connecticut and the success of the New York scheme will soon bring the agricultural colleges to the sense of their obligations to the public; but better than that, they will provide competent professors and teachers, of whom there has been a nearly sufficient lack to account for the failures of the agricultural schools.

But in the third place, no small part of the industrial capital of the country, reinforced and assisted by its mechanical and inventive genius, is at present engaged in perfecting and inventing agricultural implements and machinery of which the riding plow, the self-binder, the disk and screw harrows are the latest results, to be followed by the corn husker, cotton picker, and many no less important inventions, which, added to the progress already made, will advance practical agriculture abreast with the improved manufacturing industries and the higher arts.

Already has agriculture made the resumption of specie payments possible; already has it brought the United States up to the first rank among nations; and having achieved these distinctions in the past, it is sooner or later likely to become as fashionable as it has always been an honorable profession. Should such a change take place, the rush of young men to the cities would be in a measure prevented, the professions would soon be less crowded, the number of the predaceous classes would be lessened, our morals would be improved, our politics purified, and instead of political swindlers and one-horse lawyers, the Government of the country would be in the hands of its thinkers and workers, the farmers, mechanics and business men of the country.

Champaign Co., Ill.

Dairy Husbandry.

FLAVORING MILK.

PROFESSOR E. W. STEWART.

A FEW years ago dairymen thought their business limited to a very narrow belt, diversified by hill and valley, where only the finest grasses flourished in perfection, and the water ran in clear streams or bubbled from pure springs; that nature had forbidden to the broad, level, stretching prairies of the West the production of the finest butter and cheese.

But this vision of exclusive privilege soon passed away under skillful management, and excellent butter is now produced from the Atlantic to the Pacific. It was soon found that skill, and not a "dairy belt," must determine the quality of the product. Milk is extremely sensitive to the flavors of foods, but so, likewise, is the flesh of cattle fed for beef. Where beef of the best quality is produced, there skill is equal to the production of the finest butter.

The study of foods and their peculiar flavors is certainly important to the dairyman. This study would show him that he may easily control the flavor of the milk he produces through the foods he furnishes to his cows. It is true that different cows give milk of slightly different flavors from the same food, because one cow selects or appropriates more of certain qualities than another, but these individual differences do not materially change the quality of the butter product.

A distinguished French agriculturist, M. Monclar, has lately proposed to give any desired flavor to the flesh of cattle, sheep, pigs and poultry, by different combinations of food. He mentions hares killed in a wormwood field, larks shot after eating cabbage, and eggs laid by hens that had eaten of diseased silkworms, as having a nauseating flavor; while ducks fed upon sprigs of juniper had a delicious flavor. He fed rabbits with the waste of aniseed mixed with barley and bran, and others with food flavored with the essence of thyme. In both of these cases he found a distinct and agreeable change in the flavor; and he comes to the conclusion, from various experiments, that cattle and other animals may be given such flavors of flesh as the skillful feeder may desire. This may be pushing the point to an extreme, but all dairymen are familiar with the fact that milk takes readily a flavor from turnips, leeks, onions, cabbage, etc. These flavors are more marked and distinct than those of common foods, but every food gives its own peculiar flavor. It has been found that so good a food as red clover, when fed alone, gives milk an inferior flavor to that given by white clover, and especially by a mixture of grasses. As each food has its own peculiar flavor, it is evident that a large variety of grasses in a pasture will give a milk of a higher flavor than one seeded with only two, say clover and Timothy, as is most frequently the case. The aromatic herbs among the grasses cropped by the Swiss cows upon the mountains produce a highly flavored milk greatly relished by travelers.

These instances conclusively prove that the flavor of milk may be under the control of the dairyman, for he may select his own flavoring foods. If he is about to lay down pastures, he may not only increase the production of food upon a given area, but greatly improve the flavor of his milk by seeding with a variety of grasses, and selecting some especially for flavor. Yet some of the best foods for milk

are also equally good for flavor. Alsike clover (Trifolium hybridum) produces a large yield of food and gives a fine flavor to the milk.

Mr. Chamberlain, of Maine, whose experience with this clover has been of many years' duration, says it bears cropping by cattle well, proving its adaptability to pasturage. He also pronounces it the best honey plant known. This would prove its quality for flavor in milk, as the best honey plants are found to give an agreeable flavor to milk—white clover standing very high both for the production of honey and milk. These two clovers are so important in a perfect dairy pasture that they should not be omitted where the soil is suitable.

A flavoring plant not much grown in this country, but well worthy of trial upon light soils, is the melilot—the yellow (Melilotus officinalis) and white (Melilotus alba), the former sometimes called French Clover, and the latter Sweet Clover. The stems have very numerous branches, and, when thrifty, grow from two to four feet high. It is woody when it reaches the blossom, and should, therefore, be cut before blossoming. It becomes very fragrant in drying. A species of this plant is used in Switzerland to give the peculiar flavor of Schabzieger cheese (called here Sapsago cheese). When quite young, cattle are fond of a small portion of it mixed with other grasses. It might easily be dried and a small proportion mixed with other fodders in winter to give flavor. Its nutritive value is nearly the same as that of red clover.

Sweet-scented Vernal Grass is valuable as a flavoring plant, although not well relished as a single food. There is not space to mention many of the highly flavored plants, but dairymen will have no practical difficulty in finding plenty of them to give an agreeable flavor to milk when they shall make an effort.

In winter feeding, the dairyman is often obliged to feed some straw, cured corn fodder and the like, which are quite negative as regards flavor. These foods must, of course, be fed with some kind of grain, bran, or some other concentrated food if milk is to be produced profitably, and with this grain food may be mingled some flavoring materials, such as Fenugreek seed, which is used in the composition of condimental cattle foods. Fenugreek means Greek hay, and was used by the Greeks as fodder. There is probably no difficulty in raising this plant in this country. Aniseed, carroway-seed, coriander seed, ginger, tumeric-root, are all used for flavoring such condimental foods and condition powders, sold usually at six prices to those who do not examine foods for themselves. A small amount of these flavoring materials mixed with corn meal or wheat middlings, may be kept on hand to be mixed in small quantities with other grain food as used. We pay a good deal of attention to flavors in the preparation of human food, and it would undoubtedly pay us well to give more attention to flavoring the foods for the production of milk.

SMALL CHEESES FOR HOME USE.

THERE is no necessity to say anything in favor of small cheeses for domestic use. The housewife "who looketh well to the ways of her household" will at once appreciate the value of a choice and uncommon—"'tis true, 'tis pity, and pity 'tis 'tis true," that it should be an uncommon—manner of using a few quarts of milk to advantage. The difficulty lies in not knowing how to work the milk up into toothsome cheeses which may be eaten fresh at any meal, or even "between times," when one "pieces out" the cravings of a vigorous farm appetite. To make a short story of the *modus operandi* let us begin with

THE RENNET.

This is made of the empty stomach of a sucking calf, salted and dried upon a bent twig in any airy place (Fig. 283). The rennet is at its

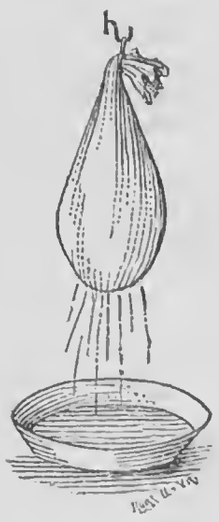

FIG. 284.

FIG. 283

best when 18 months old. A stock of these should be kept in every farm-house; or, the stomach, fresh or dry, may be put into a quart of salt water and left for three weeks, when the liquid is ready for use. Of this liquid rennet one tablespoonful is enough for 40 quarts of milk, and one teaspoonful for 12 or 13 quarts. Too much rennet will make the curd hard; and as this kind of cheese should be soft, rennet should be used sparingly. About four quarts of milk will make a pound of cheese.

THE CHEESES

should be used fresh and before it has cooled. If it has cooled it should be warmed up to 90 degrees. The curd of 12 or 15 quarts may be made in a large tin pan. The rennet is stirred in the milk and the milk is left in a warm place for an hour when the curd is set. A convenient method of setting the curd is to lay a square of fine muslin in the pan, securing the ends on the edge and pouring the milk into the muslin; when the curd is set, the corners and edges of this are drawn together and tied and the whole lifted out and hung up to drain. (Fig. 284.) As soon as the whey is drained off the curd is put into

THE MOLDS.

These are made of thin veneers of some sweet wood, as maple or beech, or of tin. They may be round, of any shape to suit the taste, and without bottom or top, about three inches by two and one and one-half deep, or larger if desired. Mats made of clean rye or wheat

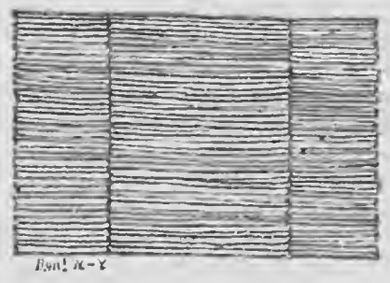

FIG. 285.

straw sewn together (Fig. 285) are used to rest the molds upon while the cheese is making, and the mats are placed upon a towel which absorbs the moisture. The molds and their contents are turned daily for three days, and, if desired, are sprinkled with salt at each turning.

THE MILK

are ready for eating fresh in three days; or, they may be taken to an airy dairy house or cellar and kept for curing for six weeks or two months, being turned every day and laid upon a layer of sweet straw upon a lattice shelf (Fig. 286). The curing process may be so man-

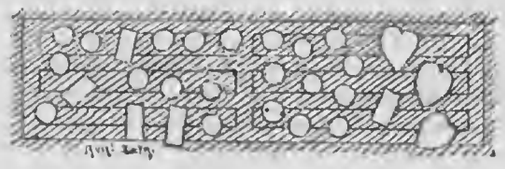

FIG. 286.

aged as to give a great variety of flavors to the cheese. If mold gathers upon them it is scraped off occasionally. Clothes dipped in vinegar may be wrapped around the cheeses, or these may be covered with pulverized sweet herbs. Much ingenuity may be exercised in this way to vary the character of the cheese, and doubtless in time some discoveries may be made through which one may hit upon a desirable market product that will furnish a profitable industry for the family. This is an undeveloped possibility with us. In other countries millions of cheeses of this kind, but in great variety, are made and sold yearly and some persons have made in past years a wide reputation which has descended with its comfortable profits to their children. This is an uncultivated field the culture of which is open to farmers' wives and daughters of enterprising mind.

CREAM CHEESE.

A delicious morsel for tea or dessert is a fresh cream cheese. This is made of the thick cream which rises on shallow pans, and which can be taken off almost in a solid piece. No rennet is used. This thick cream is either put at once into the molds lined with fine muslin, or is hung up to drain as with the curd previously described, for 24 hours. It then becomes semi-solid and is put into the molds and covered with a follower which is pressed down by a light weight for two or three days, when it should be eaten at once. Either no salt is added, or the cheese is lightly sprinkled once a day when it is turned by reversing the mold. This cheese may be eaten with bread, biscuits, crackers, or as an adjunct to apple pie or fruit. Cheese and apple pie go very well together, and "pippins and cheese" was a standard dessert dish in the time of Shakspeare, in whose works it is referred to. The cheese of those days, however, was a genuine delicacy and had not suffered the disgrace of the evil communications and corruptions of oleomargarine. But at least home-made cheese may be free from guile and be eaten without fear or reproach. It is much to be desired that farmers should make more use of their many opportunities for increasing the comfort and well-being of their households, both by raising for domestic use a wider range of products, especially in the garden, and by utilizing for the same purpose more of the commodities now raised by them chiefly for market.

Horticultural.

IMPROVED ASPARAGUS CULTURE.

WILLIAM ROBINSON,
EDITOR AND FOUNDER OF THE LONDON GARDEN.

THANKS for your letter. As to the Asparagus regarding which you have kindly written to ask my opinion there is little to be said but a good deal to be done.

In this country we have always gone on the wrong principle, as regards planting asparagus—putting 10, frequently more, plants on the space of ground that should be occupied by one, and compensating for this folly by putting as much manure as can possibly be spared under the plant. To such an absurd extent was this carried on that it was not an uncommon thing in large places to place from three to six feet of thoroughly manured soil under the beds; the result was that it was the rarest thing in the world to see a good dish of asparagus, even in the best places. Another consequence of the system was it was so costly that it could only be carried out on a very small scale, and thus in the majority of gardens with us, not one-quarter the area is occupied with asparagus which the importance of that vegetable calls for.

The question of kind is altogether of less consequence than the question of culture, which, however, is simple enough. Here we have only one kind, the common kind—and pretend to have no more. At Argenteuil they claim to have three distinct kinds, the early and the late, and also an intermediate kind. The Dutch also have their sort which, certainly, as they grow it, is most excellent, judging from samples I have this year had sent me by Messrs Van Eeden of Haarlem.

As yet, no experiments of the slightest importance have been carried out in this country to determine the differences, if there be much or any, between the various kinds, both French and American. Such a trial would not be difficult, and it is my intention to make it, when I can do it under favorable conditions. Far before the question of kinds, however, is for us that of the proper supply of our tables and markets with good asparagus. Every year larger supplies are coming from France, and there was scarcely a day this year when, for one bundle of English asparagus to be found in Covent Garden, one could not find there 400 of French growth!

In France the culture is spreading very rapidly from the old center, Argenteuil. Large supplies now come to us from Dijon, and places much further south, and also from Versailles. Earlier, a good deal comes, some from Spain. You can imagine how well it "eats" after traveling that enormous distance. No doubt we are a little "later" than the north of France, but I am not speaking of early supplies so much as of those that come in at about the same time as our own.

English asparagus, when well grown, is cultivated on such a costly system, and also on such dear land that a much higher price is asked for it than for the French. The supplies in private gardens are so wretchedly grown generally that they are no aid at all to the market supply, and when any does chance to come it is used as "sprue" in soup-making. The old idea of sticking the plants close together in beds is so firmly rooted that it will be difficult to get it out of the public mind. Only last week I saw in a calendar of operations written by a practical gardener, instructions that the plants should be put a foot apart in the line! However, I have no doubt by continually agitating the question we shall get the right way carried out some day, and then, when people see a few good plantations made after the rational manner, they will all follow suit.

The plan which I seek to make known everywhere is that of planting well chosen yearling roots at a distance of about three and a half feet each way, and when the soil is of fairly good character, such as most of our garden land is, not making any special preparation at all in planting, but simply opening a shallow trench (eight inches deep) and putting the plants on tiny mounds at the bottom of it. The distance seems wasteful to our growers but it is really not so, because a light crop can be taken off between the lines, until the roots and stools fill the ground. Any necessary manure may be given when the plants get strong and begin to need it.

Next year begins a series of competition for prizes which I offered for the encouragement of this simple mode of planting in the hope that our own people may some day supply our own tables and markets. These prizes will be given for a number of years, and each year be held in a different center, so that attention may be called as much as possible to the right mode of culture and to its results. In these enterprising days I shall expect to see some American asparagus sent to our markets. So far as I can judge by preserved specimens, you have a good idea of growing it in your market gardens. If some specimens could be sent over to one of our exhibitions, it would be very interesting. You, I believe, cultivate it with the plow. We have not come to that yet, though the demand in our markets should encourage asparagus culture on a large scale. About Paris in certain districts they begin to grow it in that way, but not at Argenteuil, the old home of asparagus culture, and where all the finest specimens are yet grown. It must not be supposed from the preceding statements that the culture in our gardens is equally singular in other respects. Asparagus is the only vegetable that is absurdly and systematically maltreated with us, and this results from the perpetuation of the wrong system in books for many generations past.

INFLUENCE OF THE STOCK ON THE GRAFT.

PROFESSOR THOMAS MEEHAN.

I OFTEN see in the RURAL items that interest me very much. Its pages have had much to say lately of the influence of the stock on the graft, and apple roots in the nursery rows are referred to. It is true each variety—or at least many varieties of apples have different looking roots, according to the variety grafted on the stock. But I have never been able to see that this bore on the question of change of character in fruit by grafting, which is the great point involved in this controversy. The form and character of all roots are more or less influenced by the amount of food they receive, and the food of plants in a great measure depends on the foliage. A tree with a given amount of foliage and, say, a hundred square feet of leaves, will have different roots from one with the same amount of roots and two hundred square feet of foliage. A variety of apple, therefore, with limited leaf surface will turn out in the nursery rows different looking roots from varieties which have different conditions. In other words, the difference is the result of nutritive advantages, and not of any constitutional changes as we understand by hybridization through grafting. There is evidence, I think, which sustains the view that graft hybrids do occur in nature, but I do not think the varying roots in nursery rows is one of these evidences.

I am glad to know that the RURAL NEW-YORKER is prospering. It deserves success.

RURALISMS.

THIS being the season of fairs and horticultural exhibitions, I wish to say a few words about some bad practices that obtain at many of them. The hall or tent is supposed to be cleared for the judges, but you seldom see anything of the kind. It is too often the case that some of the competitors hang around the judges, listening to the discussions, and even volunteering advice when their own articles are reached. This is all wrong and should disqualify any one guilty of the practice. I have been annoyed almost beyond endurance in this way. Modesty would suggest that competitors should at least retire to some remote part of the hall when it is not convenient to go out of it altogether. No wrong may be meant, but it looks bad, and is annoying to the judges.

I HAVE a word, too, for the managers of fairs and exhibitions. There is always a rule in the premium list that exhibitors must have their articles on the table by a certain hour ready for the judges. The judges are requested to meet at that hour, and often come fifty or a hundred miles, taking an early start to be on time. Do they find the exhibits ready for inspection? Not very often. On the contrary, they are frequently kept waiting three and four hours, and must then peform their duties in a hurried, imperfect, and very unsatisfactory manner—unsatisfactory, sometimes, to all concerned. This should not be so, and would not be so if the officers and committees performed their duties in any thing like a faithful manner. But what can be expected when most of the officers shirk their duties, and leave all the labor and burden of the day to one or two alone, with some volunteer help at last from a few who compassionate their worn and wearied looks? Unless the rules are strictly enforced, exhibitors will come at last to understand that they can enter almost when they please, no matter at what inconvenience to others; and unless officers and committees perform their duties, nothing will be arranged in time, no matter how promptly sent in. This condition of things is much too common and calls for reform.

MY Japan lilies (*Lilium speciosum*) are now in the hight of their bloom, and they are very beautiful. These are the lilies for the masses, being hardy, easy to grow, profuse in bloom, and presenting a charming variety of color. It is commonly recommended to lift the bulbs and divide them about every three years. This I consider a mistake, at least for the amateur. Plant them about four inches deep in well prepared ground, give them plenty of room to in-

crease, and let them alone as long as they continue to do well. They are grand when in masses.

THE hyacinth is perhaps the most popular of winter-blooming bulbs and deserves all that is said of it. I cannot, in this column, go into the details of description and culture, but I am moved to present a list of hyacinths for amateurs who grow bulbs in rooms in the winter. I have tried, in both rooms and greenhouse, nearly everything that has appeared in the catalogues during the last thirty years, and this is the result for room culture. The varieties are almost numberless, but some do much better in rooms than others. The list could be increased in number, but with little or no gain to the growers. For the greenhouse, I should modify the list and increase the number to select from. Shades of blue: L'Amie du Cœur, Orondatus, Baron Tuyll, Porcelain Scepter, Envoyé, Blocksbergen, Prince von Saxe Weimar, Charles Dickens, King of the Netherlands. Shades of red: Bouquet Tendre, Dibbitz Sabalskonski (what a pity that such a beautiful flower should have such a horrid name!), Lord Wellington, Madame Zoutman, Grootvorst, Acteur. White and rosy white: Grand Vainqueur, Miss Kitty, Grandeur à Merville, Triumph Blandini. Yellow: Heroine (single), King of Holland, Rhinoceros, La Pluie d'Or.

There is a little bulb that has given me so much pleasure for three or four years past, both indoors and out, that I must bring it to the notice of the readers of the RURAL. I mean Tritelcia uniflora. It is an alliaceous plant It seems to be very little known, and the bulb catalogue of the Messrs. Thorburn & Co. is the only one in which I have seen it. It is very likely, however, to be in that of the Messrs. Woolson. The flower is star-shaped, nearly an inch in diameter, white, with a grayish-blue stripe in each petal, and is pleasantly fragrant, though the foliage is not. Though only one flower appears at the same time from a stem, there is a long succession of flowers. The plant itself is pretty, the long, narrow leaves being gracefully curved. It is one of the best bulbs for room culture I have ever grown, and forces well in the greenhouse. The more one sees of it the better he likes it. There should be not less than half a dozen bulbs in a four-inch pot. It is perfectly hardy, continues long in bloom, and is fine in masses in the open air. It should be planted early in the border, as it makes its leaf growth in the Fall. It is one of those pretty, modest little flowers so apt to be overlooked.

There seem to be very few who grow the Plumbago Larpentæ. It must be because they do not know that it gives us, during late Summer and Fall, masses of handsome, dark-blue flowers, and is in all respects a desirable border plant, or, for that matter, a good bedding plant for late blooming. It should not be often disturbed, as it is not at its best till well established. It is an old plant, and at one time was much admired.

There are very few who have grown Lilium auratum in the open border who have not complained of want of success. The trouble is that the bulbs gradually dwindle away until there is nothing left. It has been suggested that home-grown bulbs would do better; but there will be few of these while bulbs can be imported so cheaply. In my first attempts to grow the Auratum I met with the drawback so generally complained of. I then began experimenting, and used up a good many bulbs before reaching satisfactory results. I tried all kinds of exposures and a variety of soils. As the result I found that soil is more important than exposure. The soil that has given me the best result is a light sandy loam, with a free admixture of leaf mold (not muck). In this the bulbs (planted about five inches deep) have maintained and increased their size, giving me stout stalks and plenty of large flowers, even up to twelve and fourteen inches in diameter. This may be a useful hint to others,

---

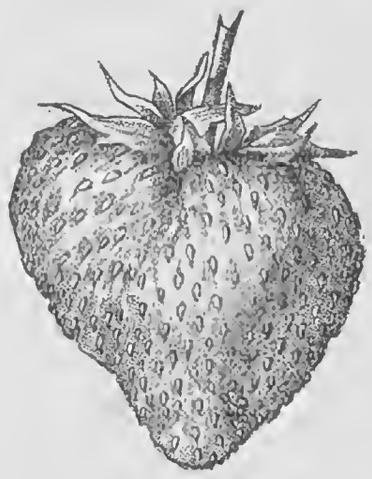
A good hardy herbaceous plant, which has been in bloom nearly all Summer, and will continue till frost, is the double white Lychnis. This is not as common as it should be. It pleases me best when allowed to grow on the ground without support. It takes up more room in this way, but is less trouble, and the effect is much finer. I have it both ways.

HORTICOLA.

STRAWBERRIES.

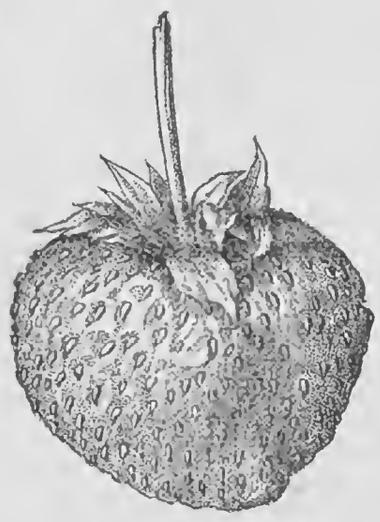
THE MARVIN.—We have already referred to the Marvin as entitled to rank among the more promising of the newer strawberries. Mr. J. T. Lovett, at our request, gives his opinion of it as follows:

Plant of the style of Jucunda, but of stronger and more vigorous growth with larger, enduring foliage, and prolific. Berries very large, approaching those of the Sharpless, uniform, bright crimson, smooth, glossy with prominent bright yellow seeds, rendering it peculiarly showy and firm. Flavor good to very good. It is so extremely late that the first berries ripened June 9, at a time when most other varieties were nearly gone—and it continued in fruit until the 25th. It is a most promising variety both for home use or market, and so far as one can determine from a single year's fruiting, it excels all others by far as a very late berry.



MARVIN NO. 1.—FIG. 287.

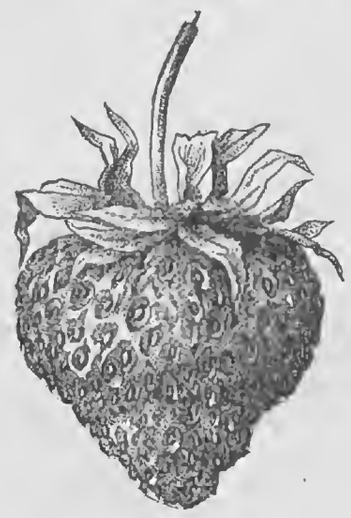
Mr. Roe says, regarding the Marvin, that it is very highly praised, and thought by some to be the coming berry. The plants he set out last Spring bore some large, late, and very firm berries of good flavor. Pres. Lyon, whose opinion respecting fruits of any kind is always entitled to respect, says that "it is a highly promising, very large, late variety." It is said to be a cross between the Wilson and Jucunda Our engravings, which are portraits from life, show the form and size of *average* berries.



MARVIN NO. 2.—FIG. 288.

LONGFELLOW.—Plants of this new variety were received from Mr. E. Williams last Spring. We do not feel justified in pronouncing any emphatic opinion of its value from the test of a first season's growth and production. The plants have made a strong growth of tall, healthy foliage. Berries average larger than our portrait, with prominent necks. The quality is very good and the season medium.

LONGFELLOW. FIG. 289.



BIDWELL NO. 1.—FIG. 290.

BIDWELL.—This is another new kind of Strawberry of fine promise. It has, however, up to this time been tested but by a few and its merits cannot be spoken of without reserve. The plant is a strong grower with foliage, like the Sharpless, large and healthy, forming thickset stools of unusual productiveness. The berries are large, conical and regular both in form and size, of a bright red color and excellent quality. Its season is between medium and late.

BIDWELL NO. 2.—FIG. 291.

Farm Economy.

WHY ARTIFICIAL MANURES FOR POTATOES DO NOT PAY.

DR. J. B. LAWES, OF ROTHAMSTED, ENG.

IN the RURAL of April 10th you ask, why I do not think that it will pay to use artificial manures for potatoes, as well as for other root or cereal crops. It is somewhat difficult fully to explain my reasons for such an opinion without occupying more space than can be spared for the purpose. I will, however, make a few observations with regard to the subject of the question you put to me, which possibly may be interesting to your readers.

I conceive that the selling price of the ordinary farm crops in the States is not dependent upon the cost of manure, ordinary or artificial, and that a farmer who was asked to put down the items of cost in growing a crop of corn, or wheat, would confine himself to the labor employed in various forms, and the price of the seed. If this be the case, the profitable use of any manure must depend upon its capability of producing an increase of crop exceeding in value the cost of the manure required to produce such increase. I will confine my remarks to artificial manures alone, which may be divided into two classes:—first complete manures; by this I understand manures furnishing all the soil elements of plant food in sufficient quantities to grow the crop: second, partial manures which furnish one or more of the ingredients that may be deficient in the soil, and thus enable the plant to make use of those which are in excess.

A complete manure which increased a crop of corn from 30 to 60 bushels per acre, or a crop of potatoes from 200 to 400 bushels, ought to leave the land no poorer in the more important constituents of plant food, than it would be supposing the smaller crop had been grown without manure.

An experiment with a complete manure has been under trial at Rothamsted, where, for ten years, the soil ingredients contained in one ton of hay have been applied every year to one acre of permanent pasture.

The following are the quantities:

Sulphate of Potash	76 lbs.
Sulphate of Magnesia	35 "
Superphosphate of Lime	52 "
Silicate of Soda	100 "
Sulphate of Ammonia	82 "
Muriate of Ammonia	32 "

The average produce of hay obtained by this application has been 32¼ cwts; while during the same period of ten years, the permanently unmanured land yielded annually 20 cwts of hay per acre. The increase of crop therefore obtained by the application of the manure only amounted to 12¼ cwts; and, as the cost of the manure may be roughly estimated at 12 dollars, it would exceed the value of the increase obtained. From a commercial point of view there are, then, two forcible reasons, why the result of applying artificial manures to hay, is less effective than their application to cereal crops: first, the hay crop relatively sells at a lower price than the cereals: second, it removes more of the constituents of the soil. The same may be said of potatoes, and, to a certain extent, of root crops in general, but with a distinction which I will now explain.

In England artifical manures are not largely used for potatoes, because (as in the case of the hay) they would be too expensive, inasmuch as the tubers are carried off the land. They are largely used for turnips, mangels, etc., but not as a complete manure, nor with the intention of selling the products off the land. The usual practice is to consume them for feeding purposes, and thus they find their way back to enrich the soil.

If complete manures are to be used profitably in the States at the present time, they must be applied to those crops which command the highest price in proportion to the soil constituents which they contain. For equal money value corn or wheat would remove a much smaller quantity of the soil constituents than either hay or roots. My reasons for saying that one crop may be profitably grown with artificial manures, while another cannot be so grown, are based upon the above-named considerations, and I am rather disposed to think that advocates of complete manures base their ideas on a somewhat erroneous view of the true function of artificial manures; inasmuch as they do not take into account the present low prices of agricultural products, which in many cases will not admit of artificial manures being used with profit. Soils in general contain some of the important ingredients of plant food in greater abundance than they do others. The successful use of plaster to the clover crop in the States; of sulphate of ammonia to the sugar cane in the West Indies; of nitrate of soda to cereal crops in general in England, and of phosphate to root crops, all indicate that soils contain an excess of one food, and a deficiency of another.

One important fact may be learned from the experiments upon hay, to which I have referred above, namely, that the manure ingredients placed upon the land are not all recovered in the produce. This, too, is not an isolated fact but one confirmed by the whole of the Rothamsted experiments, and is due to two very different causes; first, the insolubility of the compound which is formed with the soil by certain manure ingredients; second, the very soluble nature of other manure ingredients, which results in their loss by drainage. These two causes combined make the distinction between the amount of ingredients which chemists find in any individual crop, and the amount which experiments or practical agriculture have shown must necessarily be applied in order to grow that crop.

SINKING WELLS ON GRAND ISLAND IN THE NIAGARA RIVER

WE have received an interesting account of the manner in which this is done from a resident there, by which, in most cases, a never-failing supply of pure water is obtained. This island contains 17,300 acres and has nowhere on it an elevation of over 50 feet above the Niagara River. It is destitute of springs or permanent running streams, and those not dwelling close along side of the river are dependent entirely on cistern and well water for household purposes and watering their domestic animals.

Grand Island, and in fact the whole neighboring region, is underlaid by a thick bed of hard limestone rock, reaching from 25 to 70 feet below the surface of the ground, which is generally a good clay loam. Between this clay and next to the rock, is a stratum of sand and gravel one to two feet thick, which on being perforated, yields the water sought for in any desired quantity. The wells are bored with a 14-inch augur, stone socket pipes eight or nine inches in diameter, are put down this boring to the bottom, and iron water pipe and pump then inserted within the stone pipe.

The cost of sinking a well and inserting the stone pipe complete, is $1.25 per foot. The iron pipe and pump to be added are an additional charge of $15 to $30, according to the depth of the well and the kind of pump used. Our informant tells us he has sunk five wells for the accommodation of his household, dairy and domestic animals, of which he has large herds, at an average cost of $100 each, and he would not be without them now, even if they were to cost him four times this amount (which would be $2,000) to replace them.

The water in the wells rises to within 15 to 20 feet of the surface of the ground. Where this water comes from is a mystery, as no highlands are near Grand Island, and the river water cannot percolate through the dense body of clay lying above the rocks. Sometimes, however, water has not been found at the rock surface, and drilling more or less feet into it has been necessary here; but very seldom has water finally failed in finding passage through the seams of this rock.

Several wind-mills have been set up on Grand Island for pumping water and other purposes, thus lessening the labor of the farmers considerably. A 10 to 12-foot wheel is large enough to pump water for 100 head of cattle. The price of such a mill is from $100 to $150, and the cost of erecting the upright timber frame to hold one is from $15 to $30, according to th finish put on it. The timbers should be very strong and well bolted together and the supporting post on which they stand be of durable wood and sunk five to six feet into the ground. The frame should be painted as well as the mill, thus adding both durability and ornament to the structure, and also giving it a more picturesque appearance.

There are many different models of wind-mills advertised in this and other agricultural papers, some of which are of decided excellence while others are only tolerably good. We advise all who wish to establish them on their farms to examine the workmanship and operation closely before purchasing, and not to credit more than half of what the numerous agents scattered about the country tell of their virtues. A good wind-mill saves fully $100 per annum in manual labor, where any considerable number of animals are kept, as it may not only be used for pumping water, but also for cutting corn-stalks, straw and hay for stock feed, sawing wood, turning grindstone and various other purposes.

Here is an excellent example for landholders to follow in various other parts of the United States, and particularly on the broad lands of the West, where they are so destitute of springs and running streams. We are glad, however, to say that wind-mills have now come into much use there, and we hope wells will rapidly follow wherever needed. How often have we seen in our travels there horses and cattle of great value wading knee-deep through a wide rim of filthy mud surrounding a pond of foul surface water collected in shallow ravines and hollows to quench their burning thirst, is such

a thing could possibly be done from a liquid of this fetid, unhealthy quality. No wonder that we hear of murrain and other fatal diseases abounding in such localities, from which our domestic animals would be generally exempt if they had pure water to drink freely, and as often during the day as required by them.

WHAT MACHINERY HAS DONE FOR AGRICULTURE.

HENRY STEWART.

In visiting the fairs the observant person will be attracted by the usual brilliant display of agricultural machinery. It may be very well worth while, as he views these exhibits, to give a passing thought to the benefits which agriculture has derived from the genius and the labors of the mechanician. We may go back in thought to the time when the spade, the hoe, the sickle and the flail comprised the farmer's store of machinery and when the plow was the rudest contrivance, hardly worthy to be called a tool. Then every man tilled the soil or engaged in pastoral pursuits because it was all one man could do to provide himself and his dependents with food. Then each man was forced to clothe himself and be his own mechanic for this simple reason. He labored long and with infinite pains, and the ancient sentence that man should earn his bread by the sweat of his brow, came home to him with unmitigated force.

In course of time improved and effective tools so lightened the labors of the agriculturist, and so increased his products, that the opportunity to make a division of labor arrived, because there was food to spare for the mechanic. And so this condition of things became more and more firmly established until it changed the whole social and political aspect of human affairs. And now what do we see? The use of the most effective agricultural machinery and the mechanical facilities for transporting these, now so cheapen products, that the whole social fabric of the oldest civilized nation of the world is threatened with revolution and reconstruction; and it is the reaper, the self-binder, the steam thrashing machine, the locomotive, the steel rail and the steamship, that have in their combined effect, brought dismay and dread to every man in Europe who lives on the fruits of the labors of his fellow men, the land-owners who live upon rents. The true "landlord" is now, not the owner of an English estate, but the farmer who commands an army of farmers, with brigades of plows, reapers and other machinery upon the plains of Western America. He makes laws for countries thousands of miles away, and his products rule the world's markets. The genius of agriculture to-day is the mechanic; the soul of agriculture is the inventor. One farmer can now, with the help of machinery, feed a hundred men with greater ease than at one time he could feed himself alone. The farmer supports the railroads, for stocks rise and fall with the good or indifferent reports of what the harvest shall be. He supports lines of steamers with his wonderful freights of breadstuffs, provisions, meats, cattle and sheep. He maintains the millions of artisans who clothe and shelter him and who provide for every one of his wants outside of the field.

The mechanical power of the age is like a series of concentric and eccentric circles of which the farmer stands out in the principal center. These all revolve with and about agriculture, and the same force sets all in motion. It is the farmer's duty now to make the most of his opportunities. He should be the foremost man of the age. His influence should be felt everywhere. It is felt everywhere, for the wealthiest merchants and capitalists and the most active politicians all ask themselves how far the farmers can be depended upon, before they make a movement in their special pursuits. But the farmer should feel this himself. It is one thing to have power and another thing to be cognizant of the possession. Let the farmers consider now their position, and as they take a view of it let them consider what they owe to the power and influence of machinery.

In conclusion, one most conspicuous example of the results pointed out may be noted. A few years ago Minnesota Spring wheat was graded very low in the grain markets and brought a low price. Unfortunately for the Western farmers this grade of Spring wheat was the only one they could produce. A "New Process" in milling was introduced. Elaborate machinery was invented to perfect the process. The best wheat by this process was the grade known as "Minnesota Spring," theretofore despised and rejected—literally "rejected," in fact, in the markets. Afterwards this grade became sought by millers, and the value advanced to a point equal to, and sometimes more than, that of the previously much sought Winter wheats. If Minnesota farmers produce forty millions bushels of wheat annually, this advanced value, due to the new process, puts several million dollars yearly into their pockets; and what a vast amount of comfort and happiness may be secured by the right use of so much money. Here we have but one instance only of the vast concatenation of circumstances, which points the moral here alluded to.

Veterinary.

THE DUTY OF BREEDERS IN REGARD TO TUBERCULOSIS.

D. E. SALMON, D. V. M.

It is scarcely necessary for me to tell the intelligent readers of the RURAL that tuberculosis and consumption are names applied to the same disease, and that this is one of the most destructive plagues to which the human race is subject.

In 1870, according to the vital statistics then taken, the annual deaths from this disease in the United States alone amounted to the enormous number of 69,000, or one in seven of the total deaths. The Mutual Life Insurance Company of New York has found that over 19 per cent. of its total losses are caused by tuberculosis, while a recent estimate in France places the deaths from consumption as one in every five.

In the four great nations of Europe—England, France, Germany and Russia—the annual deaths from this disease amount to 870,000; and, taking the world over, it is estimated that three millions of people are yearly victims of tuberculosis. When, now, we consider that with our increased population not much less than 100,000 people are annually swept away by this terrible disease in our own country, we are prepared to appreciate the value of any discoveries which throw light on its origin and the means of preventing it.

It has long been known that cattle are exceedingly subject to this plague, and that milch cows in particular are affected to a most extraordinary extent. Cruzel, in France, a dozen years ago estimated that one-half of the milch cows became consumptive. Adam, of Augsberg, by careful inspection, found that 52 out of every 1,000 animals over one year old brought to the slaughter-houses were thus affected. During my inspection of the cows of New York City and vicinity, as one of Gen. Patrick's staff, I found stables in which from one-third to five-sixths of all the cows had the plainest symptoms of consumption. In one stable, which I particularize as an extreme case, I found, by the most careful examination of the lungs of every animal, that 24 out of 30 were thus affected, and one was in a very advanced condition; and yet the milk from these cows was daily sold to be consumed by infants and invalids, as well as by the more robust classes that make up the population of a great city. More than this, when such cows are affected to a degree that makes them no longer profitable as milk producers, they are killed and then placed upon the market and sold as meat.

Now, what is the connection between these facts? May consumption be communicated through milk or meat? What momentous questions are these!

Yes, tuberculosis is a transmissible disease, and experiments of the last decade, now too numerous and plain to be questioned, demonstrate not only that the disease may be inoculated by using the tuberculous deposit, but that it may be communicated by way of the digestive organs, and that the milk, the blood, and the juice of those muscles which are used as steaks and roasts, contain the infectious principle. Stables, even, may be contaminated, and placing a healthy cow in a stall that has been occupied by a tuberculous subject is sufficient to communicate the affection.

Now, since milk is generally not heated at all before use; since oleomargarine may even contain small particles of tubercle; since the half-cooked steaks and roasts, of which many are so fond, are not subjected to a temperature sufficient to destroy disease germs, it is plain that not one of us can hope to escape taking the germs of tuberculosis into his system, and if we escape infection it is only because our organism is endowed with a vital force sufficient to resist them, while those poor unfortunates who have not this power of resistance, who, in other words, have inherited the so-called predisposition to the disease, must inevitably succumb to it. And the fact that one in every five or six of us does die in this way—that 100,000 people annually fall victims in this country alone—shows how very many are thus unfortunate.

It is evident that the time is at hand when we must think of a remedy for this terrible destruction of life and property, and it is plainly the duty of breeders to take one of the first steps. Cattle affected with tuberculosis should be destroyed. No man of principle can keep a cow that may be the means of conveying to his customers an incurable disease; much less will he place the meat of such an animal upon the market to be sold for food, or even breed from such animals to raise a new generation of tuberculous subjects. Stables in which diseased animals have been must be thoroughly disinfected, as in the case of other contagious diseases.

When society comes to realize that a disease incomparably more destructive than yellow fever, or small pox, or cholera is daily measured and weighed out and distributed in all of our cities with the milk and meat bought to support life, it will demand a rigorous control of milk stables and slaughter-houses; and this will inevitably entail an expense of millions upon millions of dollars if indemnity is allowed for animals destroyed. Hence it is probable that no such indemnity will ever be allowed. How much better for breeders to commence now and weed out such animals, as it is their duty to do, and thus obviate the necessity for State interference.

Finally, allow me, even though it may seem over-officious in the eyes of some, to add a word of warning to the breeders of the beautiful animals known as Jerseys. All of the inspectors observed that a larger proportion of these animals were affected with tuberculosis than of any other breeds. This was certainly my own experience to a most noticeable extent. In fact, very many of the wealthy inhabitants of the fashionable avenues of New York, who keep a five-hundred-dollar Jersey cow to supply their families with *pure* milk, have animals whose lungs are infiltrated with tuberculous deposits, and the lymphatic glands of various parts of the body enlarged to two or three times their normal size as the result of this disease. No one admires the good qualities and beautiful appearance of these cattle more than the writer, but here is a trouble so widespread that I would certainly be accused of exaggeration if I were more particular in regard to its extent; but so great is this imperfection that it must greatly affect the popularity of the breed at no distant day, if breeders do not adopt the most stringent policy in regard to it.

But whenever attention is called to such facts as I have just recounted, our old conservative journals raise their voices in horror against such "alarmist" views. The food we buy, they say, is much purer and better than most people imagine—probably better than such sinful creatures deserve. In other words, it is the alarmists that need censure rather than those who place such obviously destructive food upon the markets. Why, one of our leading journals absolutely refused to publish an article which I wrote eight years ago, giving an account of recent European experiments proving consumption a contagious disease, and communicable through meat and milk.

"Please don't worry us about these things," such old fogies cry; "let us continue to enjoy our half-cooked steaks from tuberculous cows; let us drink and feed our children upon the milk of similarly diseased animals, and then die if we must as our fathers and grandfathers have died before us; but don't trouble us about such disagreeable things. The fact is, you are an alarmist, and my paper says that alarmists are not to be tolerated."

And so, although there is not a minute in the day or night but that, somewhere in our country, there are sorrowing friends gathered around the death-bed of some unfortunate consumptive, since every five minutes chronicles the death of such a victim, still absolutely nothing is done to check the extension of the malady even when one of its most prolific sources is unveiled before us.

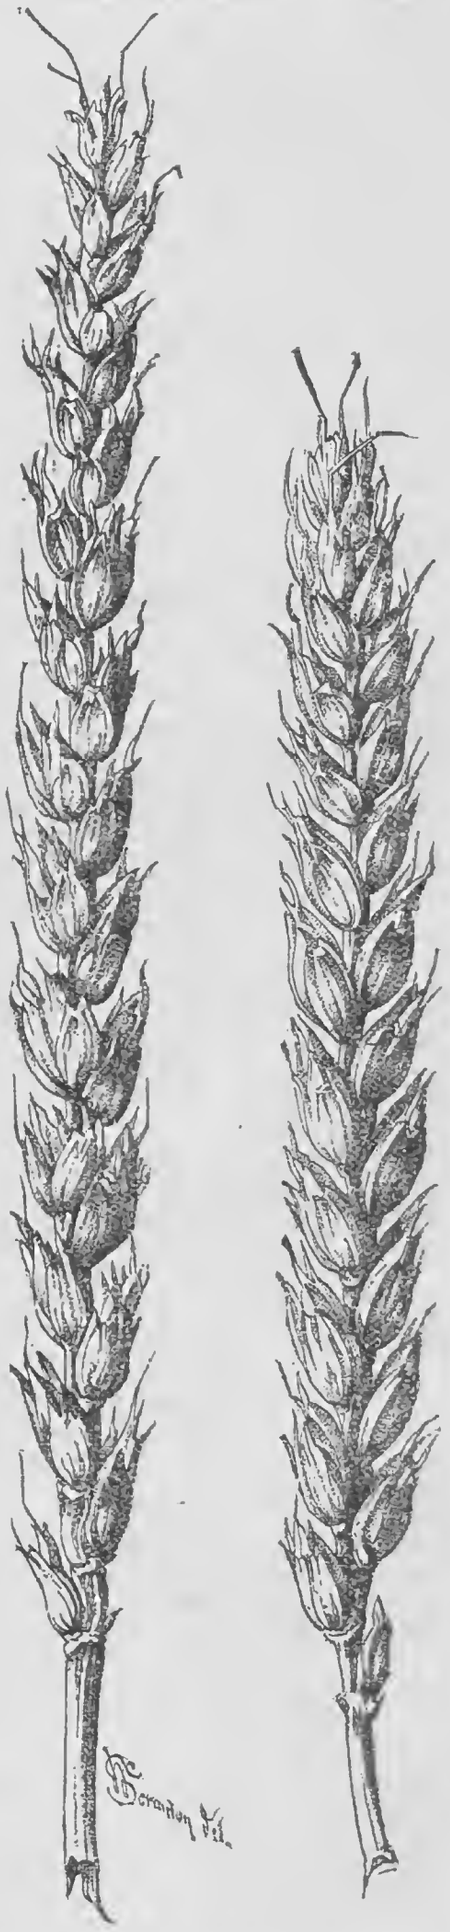
Field Crops.

NOTES FROM THE RURAL FARM.

Clawson Wheat not what it Seems.

We were among the first to raise Clawson wheat, and we have since unquestioningly preferred it to any other variety until a trial of 25 different kinds the past season has not only shaken our faith in its superior yield, but has determined us to abandon its cultivation in favor of several other kinds. Farmers, we desire to impress upon you the importance of wheat tests upon your own farms. If, as in our own case, such trials demonstrate that certain varieties will yield from 10 to 25 per cent. more grain than those you have been raising, and which you have blindly taken for granted were the best of all adapted to your soils, surely the expense and trouble of such tests upon small plots would amply be returned to you in future years.

Clawson bears a large, showy head; the kernel is large and plump. But those who have accurately measured the yield per acre have found that it has always been *less* than their estimate from the *appearance* of the field. This, at least, has been our own experience and that of those with whom we have conversed upon the subject. To illustrate this we have been at the pains of making the following comparison: Four average heads (as nearly as could be judged by the sight) were selected of both Clawson and Fultz. The spikes of Clawson measured 3¼ inches in length averaging eight spikelets on a side or 16 in the head. There were in the four heads 150 kernels, weighing precisely 106 grains. The Fultz also measured 3½ inches in length, averaging 16 spikelets. There were in the four heads 180 kernels, weighing 113 grains. Whereas, therefore, the single kernel of Clawson weighs heavier than the single kernel of Fultz, the 150 kernels of Clawson weigh seven grains less than the 180 kernels of Fultz. And yet anybody to look at the two fields of grain would estimate the Clawson as promising the heavier yield. The reason is this; first, the spikelets of Clawson are loose and spreading, giving the head a large, heavy look. The spikelets of Fultz are not loose or spreading. They "hug" the rachis giving the head of wheat a narrow, light appearance. And, second, whereas in the Clawson there are more spikelets with two kernels than with three; in Fultz there are more spikelets with three than with two—and occasionally there are four.



DEFIANCE WHEAT FROM SHRIVELED.—FIG. 292. FROM SOUND SEED. FIG. 293.

Again Fultzo-Clawson (a hybrid between the two produced by our contributor Mr. Hugh L. Wysor) was among the *showiest* of all our wheats when ripe. The heads averaged 3½ inches, with an average of 15 spikelets. Four average heads (as with Fultz and Clawson) produced 119 kernels, weighing only 97 grains. There were never more than two kernels in a spikelet. Four average heads of Lost Nation raised as a Winter wheat, produced 167 kernels weighing 101 grains. This seed again sown in the Fall would be very likely to increase in weight. The heads are far less showy than those of Clawson. Our plot of Shumaker was injured by the drought, being to the east of the barn-yard fence upon a dry, sandy soil. Yet four average heads (16 spikelets to a head) produced 160 kernels, weighing 99 grains. Even such small heads as Diehl that, to look at, would not seem to yield half as much as Clawson, would be found by the

above method of computation to yield three-quarters as much. Four heads contained 138 kernels weighing 75 grains. We need not pursue this further now; suffice it to say that it is our belief that either Shumaker, Fultz, or Lost Nation (sown in the Fall) would out-yield the favorite Clawson on this farm, and to the list we may be able to add several others when they are thrashed and weighed.

Singular results from a Wheat Experiment.

As our readers are aware, three years ago we tested various kinds of Spring wheats, among them Defiance and Champlain. Though the straw was heavy and the heads large, daily showers and intervals of a scorching sun while the grain was in the milk, so shriveled the kernels that at harvest they proved to be mere shreds. It is generally thought that shriveling does not impair the value of wheat for seed. To ascertain the degree to which the kernels might be shriveled and yet germinate, we sowed these shreds in the following Fall on a half acre. They germinated freely and the yield, though light, was far greater than was anticipated, because the plot had not received any manure for this crop, and but little for several preceding crops.

DEFIANCE FRUIT STALKS. See Fig's. 292 and 293.

The several bushels saved were, the next year, without any special object in view, again sowed on this half-acre field with a light spread of leached ashes only, and it was not sowed until Nov. 10. We beg the reader to bear these items in mind, since the results were quite unaccountable to us and to all who saw them.

The seeding was thin and the stand of wheat light; but *such* wheat we have never before seen anywhere. The straw was *very* heavy and thousands of heads measured six inches; hundreds, seven, and the largest head we could find, seven and three-eighths inches. The entire character of the grain seems to have been changed. It ripened not until ten days after Champlain and Defiance, which were sown in adjoining plots, also in the Fall, and the kernels were of a much darker color. The shorter of the two heads illustrated, is the *largest* we could find among the Defiance wheat which was sown Sept 18th on a well-fertilized plot, the seed of which was procured from the introducer, Mr. B. K. Bliss. The longer head is but an average of those of which we are speaking, viz., from the shriveled seed sown *two* years successively as a Winter wheat. The other two engravings show the spike or fruit stems (rachis) of each.

Taking four average heads of the Defiance from Mr. Bliss's seed (sown as a Winter wheat last Fall, 1879, for the first), we find 160 kernels weighing just 87 grains. They averaged 17 spikelets to a head. Four heads from the shriveled seed sown *two* years, in the Fall, averaged 22 spikelets, with 244 kernels weighing 148 grains. Why seeds from a Spring wheat so shriveled as to form mere shreds sown on poor land late in the season two years successively in the Fall, should have undergone a change so remarkable, we leave others to explain. The results of our next year's test with these large heads, we shall anticipate with some curiosity, in which we can not doubt our readers will share.

THE RURAL BRANCHING SORGHUM.

In reply to the RURAL's inquiry relative to the "RURAL Branching Sorghum," I would say that I first heard of it some two years ago (1878) and of its wonderful productiveness and growth, and on investigating the matter I found it was, indeed, an interesting addition to fodder-producing plants, that promises to excel all. In 1879 I had it growing on my own grounds, and although under great disadvantages, in addition to a drough so long and severe that my Blount's Prolific corn dried up and died within a few feet of it, yet it seemed to suffer but very little and tillered out wonderfully, each root producing from four to a dozen branches, growing strongly and sturdily from six to 10 feet high, capped with heavy heads of seeds. Now I am growing it extensively, and although it was planted a month later than it should have been, yet it is doing splendidly, and showing forth its wonderful productiveness. Although we are now suffering from want of rain, having had an excessively dry Summer, yet this field of sorghum looks as fresh and bright and is growing as rapidly as if enjoying daily showers.

It branches from the root, throwing out from four to a dozen strong branches from three-fourths to an inch in diameter, and pushing upwards with wonderful power and strength. If cut off it starts again with renewed strength and more heads and stalks, so that there is no telling what amount of fodder could be made from a single acre. It starts from the seed, slowly and feebly, seemingly to make root and get a strong foothold; then it needs hot weather, and on my ground it is doing the best on the sandy land. For the South, compared with other fodder-producing plants, it is, in my view, worth fully double as much as any other kind that has come under my notice. It needs a long, hot season to perfect its seed, which, when ripe, is valuable for chickens or stock—all eat it greedily. Stock of all kinds are very fond of the Branching Sorghum, either in a green state or dried, for it is rich in nutritious qualities. It is, indeed, a valuable addition to our fodder-plants, and on good soil an acre of it will give all that a dozen head of stock could eat for all the Summer, and even then they would not use it fast enough to keep it down. It must not be confounded with what is generally sold for Doura or "Donra Corn," being a far different article, and *ten-fold* more productive. S. OTT.

Aiken Co., S. C.

THE RURAL BRANCHING SORGHUM. — We have received the following from Mr. Henry Stewart whose testimony will readily be taken without any grain of allowance:

ED. RURAL:—"You will be interested to know that I have to-day cut one foot in length precisely of a row of "RURAL Branching Sorghum," having 12 stalks which were eight feet seven inches high, not spreading out the leaves which drooped over at least a foot, and the stalks weighed just nine pounds. This is equal to more than 65 tons per acre. Amber Sugar Cane, now in full blossom, weighed six pounds for a similar quantity. Sweet corn one hill (three feet apart) weighed, with eight ears, (four stalks) 16 pounds—stalks 10 feet long and very stout. How is this for the Sorghum? The seed was planted May 21. Each root has an average of six shoots. Where it had been cut about six weeks ago it is five feet high with about 16 branches to the root. It is growing about three inches a day now. The cows eat it both leaf and stalk, and leave not a fragment. What a crop for fodder! The stalks were not picked at all but were an average lot.

THE RURAL BRANCHING SORGHUM.—I cannot say too much in praise of the RURAL Sorghum in this climate as a soiling plant. We have been growing it for the past four years and consider it much preferable to anything we have ever tried. We have cut it three times in one season, and two of the crops were heavy. I have counted as many as 15 good stalks from one stump or root on sandy, thin land, not highly manured. It takes about the whole season for it to mature its seed in this latitude. Its capacity for standing the drought is being fairly tested this Summer. The corn crop is almost a failure, and yet the sorghum is suffering very little.

Pomological.

OBJECTIONABLE FRUIT PREMIUMS.

WHY will our agricultural societies persist in offering the principal premiums for the "largest number of varieties" of the different kinds of fruit? The tendency is already towards too many kinds, and to offer premiums in encouragement of this already existing evil is a great mistake. Where one has too many varieties it is very annoying to keep them separate, as to do so requires more room for storing, etc., and adds greatly to the labor and expense of marketing. Better our crops were of a few leading varieties than to be bothered with twenty bushels of this, ten bushels of that, five bushels of the other, and so on.

Besides, giving premiums to the largest number of varieties encourages a few unscrupulous persons to procure their fruit of other growers and exhibit it as their own. In this county about one-third of the amount given in premiums is offered in this objectionable manner, and the consequence is a sort of "scrub race" to see who will drive the furthest and pick up the most. Fruit-growers who are in the main honest are effectually ruled out. Can our agricultural societies afford to award premiums that in effect encourage rascality?

There is but one argument in favor of this practice—it makes it easy for the judges to decide who is entitled to premiums. Any one who can count is competent for this. If it is considered absolutely necessary to give a premium for the "largest collections" of apples, pears, etc., the amount so offered should be reduced. Let the man who tries to grow fruit of the finest quality have a chance also.

Onondaga Co., N. Y. NELSON RITTER.

OUR WILD GOOSE PLUM.

E. WILLIAMS.

A FEW years ago when this plum mania was at its hight, I procured and planted a tree so as to be able to judge knowingly of its merits. This season it has borne fruit of which the accompanying outline is an exact representation, in size, of an average specimen.

The color at maturity is red, sprinkled with minute white dots and covered with a delicate bloom, making it a beautiful and attractive fruit. Flesh, mild, sub-acid, better for cooking than dessert, and apparently nearly, or quite, free from rot. Its habit, if such it is, of fruiting singly instead of in clusters, as is usual with our improved varieties, is an advantage in this respect. The tree is a strong, vigorous grower and the fruit in its different stages of coloring—yellow, pink and scarlet—scattered

OUTLINE OF WILD GOOSE PLUM.—FIG. 295.

among the foliage of the tree, makes a pleasing and attractive sight. Further trial will determine its productiveness. It is not curculio-proof as was claimed. I question if we have any variety that is, though there are doubtless a number of the so-called Wild Goose varieties. Will the time ever come, "when the truth, the whole truth"—or a little less—"and nothing but the truth," will be employed in stating the merits of new fruits, etc? All of these wild or native species have been called iron-clad and curculio-proof, to a greater or less extent, notably Bassett's American, yet I saw a specimen of this on the RURAL GROUNDS last year that was almost literally covered with the crescent marks of the "little turk."

It would be interesting to note and compare the *promises* with the actual performances of the various horticultural novelties introduced for the last 15 or 20 years, and see what proportion of them have been verified. The chapter would be a long one, and I imagine a few of the more sensitive (?) actors would, like the politicians, rather not have the record consulted. Do not this untruthfulness and the extravagant use of adjectives in this connection lower the standard and retard the healthful growth of horticultural progress? This custom is not confined to horticulture and agriculture but pervades all other similar avenues of trade. Are misrepresentation and exaggeration necessary to success? I know it is often said that the American people have been humbugged so long as to have become used to it and rather expect and like it, but would not the plain truth and simple facts pay as well in the long run? The young and inexperienced may be credulous enough to believe these overdrawn claims, but older ones who have had their "eye teeth cut," are very apt to make a liberal allowance, and it is certainly wisdom to do so.

I SAW at Mr. Williams's a home-made tin label with the name scratched or pricked on it with a brad-awl. A slightly diagonal cut at each end makes a pair of ears for attaching the label to the wire of a trellis, a small stake, or a plant. All that is needed are a pair of shears, a brad-awl, and some old tin, to make a durable label. The tin oxydizes when scratched, and the mark will last as long as the tin itself. This is a plain but very good domestic label. A label "boom" is greatly needed. The present wooden label, written on with a common lead pencil, as used by nurserymen and florists, is an unmitigated nuisance, and has been productive of untold profanity. P. B. M.

Scientific and Useful.

THE VALUATION OF "REVERTED" PHOSPHORIC ACID.

PROFESSOR F. H. STORER.

AMONG the offences against sense and good morals which the selling of chemical fertilizers has introduced, there are few more gratuitously obnoxious than the custom which persists among dealers and analysts of allowing a much higher price or "valuation" for reverted phosphate—sometimes classed as "available phosphate"—than it is really worth. It is true enough that this compound (the di-phosphate of lime, or dicalcic phosphate, of chemists) has considerable fertilizing power, and that when applied to the right kinds of crops and soils it may be capable of doing capital service. But it is also true that it can be made in any quantity at extremely low cost, and if there were any call for it, it could be put upon the market in a state of practical purity at singularly low figures.

Processes for preparing both the diphosphate of lime and the precipitated tri-phosphate (bone-phosphate) also were invented some years since by our countryman Campbell Morfit, who very ingeniously sought to utilize in this way both the waste muriatic acid of European chemical works and rock phosphates of such low grade that they were unfit for making superphosphate directly. The cost of manufacturing these pure precipitated products was extremely low and they could doubtless be imported into this country at very reasonable rates. But, in the lack of any demand for them on the part of farmers, they have hitherto usually been converted by their makers into superphosphates of high grade, or they have been sold to the regular makers of superphosphates for this purpose. If, therefore, a farmer really wishes to buy "reverted phosphate" he will do well to apply to head-quarters and inquire the price. He may rest assured that it will be lower than the current "valuation" of the analysts.

There is, moreover, another way of looking at the matter, less direct, indeed, though it may seem easier to some persons. Namely, why shouldn't the farmers who want reverted phosphoric acid make it, or have it made for them, out of materials already in the markets? Even in this way, reverted phosphate could be got at a considerably lower price than the ordinary valuation. In one of the recent market reports of the RURAL NEW-YORKER the price of plain superphosphate made from bone-black, and containing 15 to 17 per cent. of soluble phosphoric acid, is quoted at $30 to $35 the ton. For the sake of round numbers, let us say 16 per cent. and $32. At the same time the price of bone-ash, containing 70 per cent. of bone-phosphate of lime was $24. That is to say, seventy pounds of actual bone-phosphate could be got for $1.20, or the pound for about one cent and a quarter. But by mixing bone-ash with superphosphate of lime in the proper chemical proportions, that is to say by adding 155 pounds of actual tricalcic phosphate for every 117 pounds of the soluble monocalcic phosphate, there will be formed some 272 pounds of the reverted, or dicalcic, phosphate; no account being taken, of course, in this calculation of the impurities or non-essential matters which accompany the phosphates.

At the prices above cited, 155 pounds of real bone-phosphate would cost $1.94, and 117 pounds of the monocalcic phosphate would cost $7 02. So that, taking no account of the labor of mixing, the 272 pure pounds of product would come to $8 96. But there would be no more than 142 pounds of phosphoric acid in the product. Hence the value of one pound of reverted phosphoric acid obtained in this way would be 6⅓ cents; or, making a liberal allowance for labor, say 6½ cents.

Instead of the bone-ash in this operation, either spent bone-black or ground rock phosphate might be used as the source of bone phosphate. If bone-black were taken the cost of the bone-phosphate would be a little greater, and if the rock-phosphate were used the cost would be a little less than the above citation. I have purposely chosen bone-ash for the calculation as representing a medium price.

To the buyers of fertilizers there is no need to insist that 6½ cents per pound are a decidedly lower figure than is commonly "allowed" for reverted phosphoric acid in statements of analysts. It would be a gain, of course, if whatever is excessive in the "allowance" could be lopped off. But the chief point to be considered, after all, is that we need to break through a vicious tradition which tolerates improperly made or shop-worn superphosphates and allows far too liberally for their imperfections. The plain fact of the matter is that true superphosphate of lime ought not to contain a noticeable quantity of reverted phosphoric acid, anyway. When a farmer buys superphosphate of lime let that article be genuine. On the other hand, in case he ever wishes for reverted phosphate, let him buy that substance, as such—or let him make it if need be. If it should ever happen that a mixture of the two is wanted, assuredly the farmer is perfectly competent to mix the harmless powders for himself. As bearing upon the suggestion that reverted phosphoric acid may be got when wanted by mixing a superphosphate with bone-ash or bone-black, it is well enough to recall the fact that it is a very old practice of European farmers to mix superphosphate and bone-meal, as a manure for turnips on certain soils.

Entomological.

A NEW WHEAT ENEMY.

PROFESSOR CYRUS THOMAS.

THE wheat throughout this section has been more or less injured by a new enemy so far as this region is concerned. It is a minute reddish-yellow worm or maggot which lives inside of the stalk, near to and usually just above the joint, from one to three at a joint. As a general rule, they select the lower portion of the stalk, but not immediately at the ground.

As there is seldom, if ever, any swelling or other unusual appearance of the stalk at the points infested, there is nothing to indicate their presence except the slightly unhealthy condition of the upper portion of the stalk and a tendency of the heads to curve downward. The maggots reside in the pith or central portion of the stalk, are about one-eighth of an inch long, and of a pale, reddish-yellow color; the two little hooklets at the anterior end being triangular and reddish-brown.

I was enabled to rear but a single specimen to the perfect state. Unfortunately it completed its transformation while I was absent from home, and was lost before my return. My assistant succeeded in obtaining a description sufficient to satisfy me that it is a species of Chlorops—a dipterous insect belonging to the great family Muscidæ.

Although specifically distinct, yet it is closely related to the Ribbon-footed Corn-fly (Chlorops tæniopus) of England; but the latter causes a very distinct swelling of the stalk, which has not been observed in reference to our species. The difference in the method of operating and wing characters indicates pretty clearly that it is not the American Meromyza (Meromyza Americana). From the description taken by Mr. Marten, it appears to differ from the species of Chlorops described by Dr. Fitch.

The only remedy I have to suggest is burning the stubble soon after the wheat is cut, as the worms do not appear to undergo their transformations until after the wheat is cut, and as they most usually reside in the portion of the stalk below the point at which it is usually cut.

I add here Mr. Marten's description of the perfect insect, in his own words:

Eyes dark-green, glabrous, horizontal diameter greater than vertical. Ocelligerous tubercle, black ocelli 3, forming a small triangle.

Front yellow, projecting, a row of black bristles on each side, and a row from the inner angle of each eye to the center of front, forming a triangle inclosing the ocelli.

Antennæ yellow, 3-jointed; second joint twice as long as first; third joint large, oval, with a stout curved bristle. Palpi small, yellow, covered with minute black hairs; proboscis geniculate, each joint about twice as long as palpi; cheeks yellow. The snout projects below to an acute angle, from the tip of which the proboscis extends, yellow. Clypens distinct; thorax yellow, with three longitudinal dark-brownish stripes, the outer ones curving slightly towards the scutellum; scutellum yellow, with a longitudinal dark strip. Plura and pectus light yellow; halteres yellow; abdomen yellow, with a dorsal dark stripe having a narrow dark line on each side extending over the first, second, and third segments; hinder margin of third segment yellow. Fourth segment has a large quadrate dark spot; fifth segment yellow; legs yellow; hind pair of femora swollen; legs covered with black and yellow hairs; wing transparent; the vein extending to the apex very faint, as is the small cross vein above it. Length not taken, but about one-eighth of an inch.

I may also add that the Melon Aphis (Aphis cucurbiti) has been very abundant and destructive in this region on the Musk and Cantaloup melon vines. It infests the under-side of the leaves of melon and cucumber vines. I have found that sprinkling with powdered lime, if properly done, is an effectual remedy; but the leaves must be turned and the lime sprinkled on the plant lice, otherwise it does no good.

Carbondale, Ill.

Educational.

ARE AGRICULTURAL COLLEGES OF ANY USE TO THE AGRICULTURAL COMMUNITY?

PROFESSOR G. C. CALDWELL.

THIS very important question could be answered on better evidence than we now possess, if the farmers might be persuaded to give them for a few years a full and fair trial; but the indifference of those for whose particular benefit these colleges were established is notorious. Let them be organized on the most liberal basis possible and manned with teachers who are masters of their respective professions, and every desired facility be offered for special education in all the branches pertaining to agriculture, and yet their lecture rooms and laboratories are but sparingly occupied by young men who come from the farm and intend to go back there. There seems only to be a lavish waste of money, which might have been more usefully expended if given to the poor. Where does the fault lie but with the farmers themselves if these colleges fail to do all their intended work, when the mass of them are satisfied to have their sons, or as many of them as they can keep at home, follow in the old ruts of practice which they themselves have followed and deepened, and, of course, as they very correctly reason, no special education is necessary for such a life.

I hold that in simple justice to the farmer boy he should have as good a chance as the one who goes to the college to get what he can there to help him to attain success in some other field. If a young man feels assured that to choose farming for his calling will not practically debar him from getting a liberal and useful education adapted to his calling, he will be less likely to choose something else; and while with business ability and a taste for farming he will, it is true, make a good farmer anyhow; yet he cannot but make a more honorable and successful career if he first spends three or four years mingling with other young men, engaged in like manner in the study of those branches of science which are intimately connected with his life's work. A writer in an English agricultural paper not long since, speaking of the strengthening appreciation of the value of an education in that country, said, very aptly, "It is now believed that energy, common sense and intelligence will everywhere outrun energy, common sense and ignorance, and that technical and scientific education will confer on those who enter any profession immense superiority over those who have it not."

In a recent report of a committee of the French National Assembly on a project for the establishment of a new agricultural college, the agricultural superiority of Germany over France, in spite of inferior natural advantages, is very fully exposed, and it is attributed to the better development of agricultural education in that country, and the more common and intelligent application of scientific rules in agricultural practice; and it is stated in this report that there are in all Germany 184 agricultural colleges, besides a great number of schools of lower grades reaching clear down to the primary instruction, and that Germany spends on agricultural education seven times as large a proportion of her income as does France. Yet the French Government this year appropriated 1,875,000 francs, or $360,000, for agricultural education, of which nearly $150,000 were for the running expenses of her three agricultural colleges and the National Agricultural Institute, at Paris, over and above their receipts

Germany has a better system of primary and higher education than we have, taking the country through, and yet she finds it profitable to add to it all this system of special instruction in agriculture and branches relating to it. The agricultural conditions that prevail in the older and more thickly settled parts of this country are very similar to those that prevail in that country, and whatever is found to be essential to the highest agricultural success in the one case, is likely to hold good for the other. If agricultural colleges and experiment stations are there found, after an experience of many years, to be so useful as to deserve and receive such liberal and hearty support both from the Government and the people, then, to say the least, they deserve fair trial here to the extent, if nothing further, of the like hearty support of the people.

Let this matter take up some of your thoughts as you compare notes with your brother farmers at your fairs, and see if, given like business ability, the most successful men among you are not your best educated men, remembering, however, that the man who raises the biggest pumpkins or the heaviest crop of corn or potatoes is not necessarily the most successful farmer. To compare notes justly you must go to his home and look at his surroundings there—his fields, his barns and his house and his bank account, as well as his crops. Taking all these things into consideration I venture to say, without fear of contradiction, that the man who is found to have the happiest family, the most children who are contented at home, the most pleasant house and convenient barns, the most serviceable stock, and the best looking farm with all its belongings, will be found to be the best educated member of your agricultural community. And if this is so, ask yourself whether is is not your duty to fit out your son who wishes to follow your own most honorable calling with all that is in your power to give him, that you may help him to gain a like enviable distinction.

Cornell University.

The Horseman.

THE PERCHERON-NORMAN HORSE.

A. B. ALLEN.

FOR heavy farm and road work, the city dray and truck, no horses ever imported into America, have equaled the larger class of this distinguished race; while those of medium size are equally admirable for the express wagon, the omnibus, and tram rail-road.

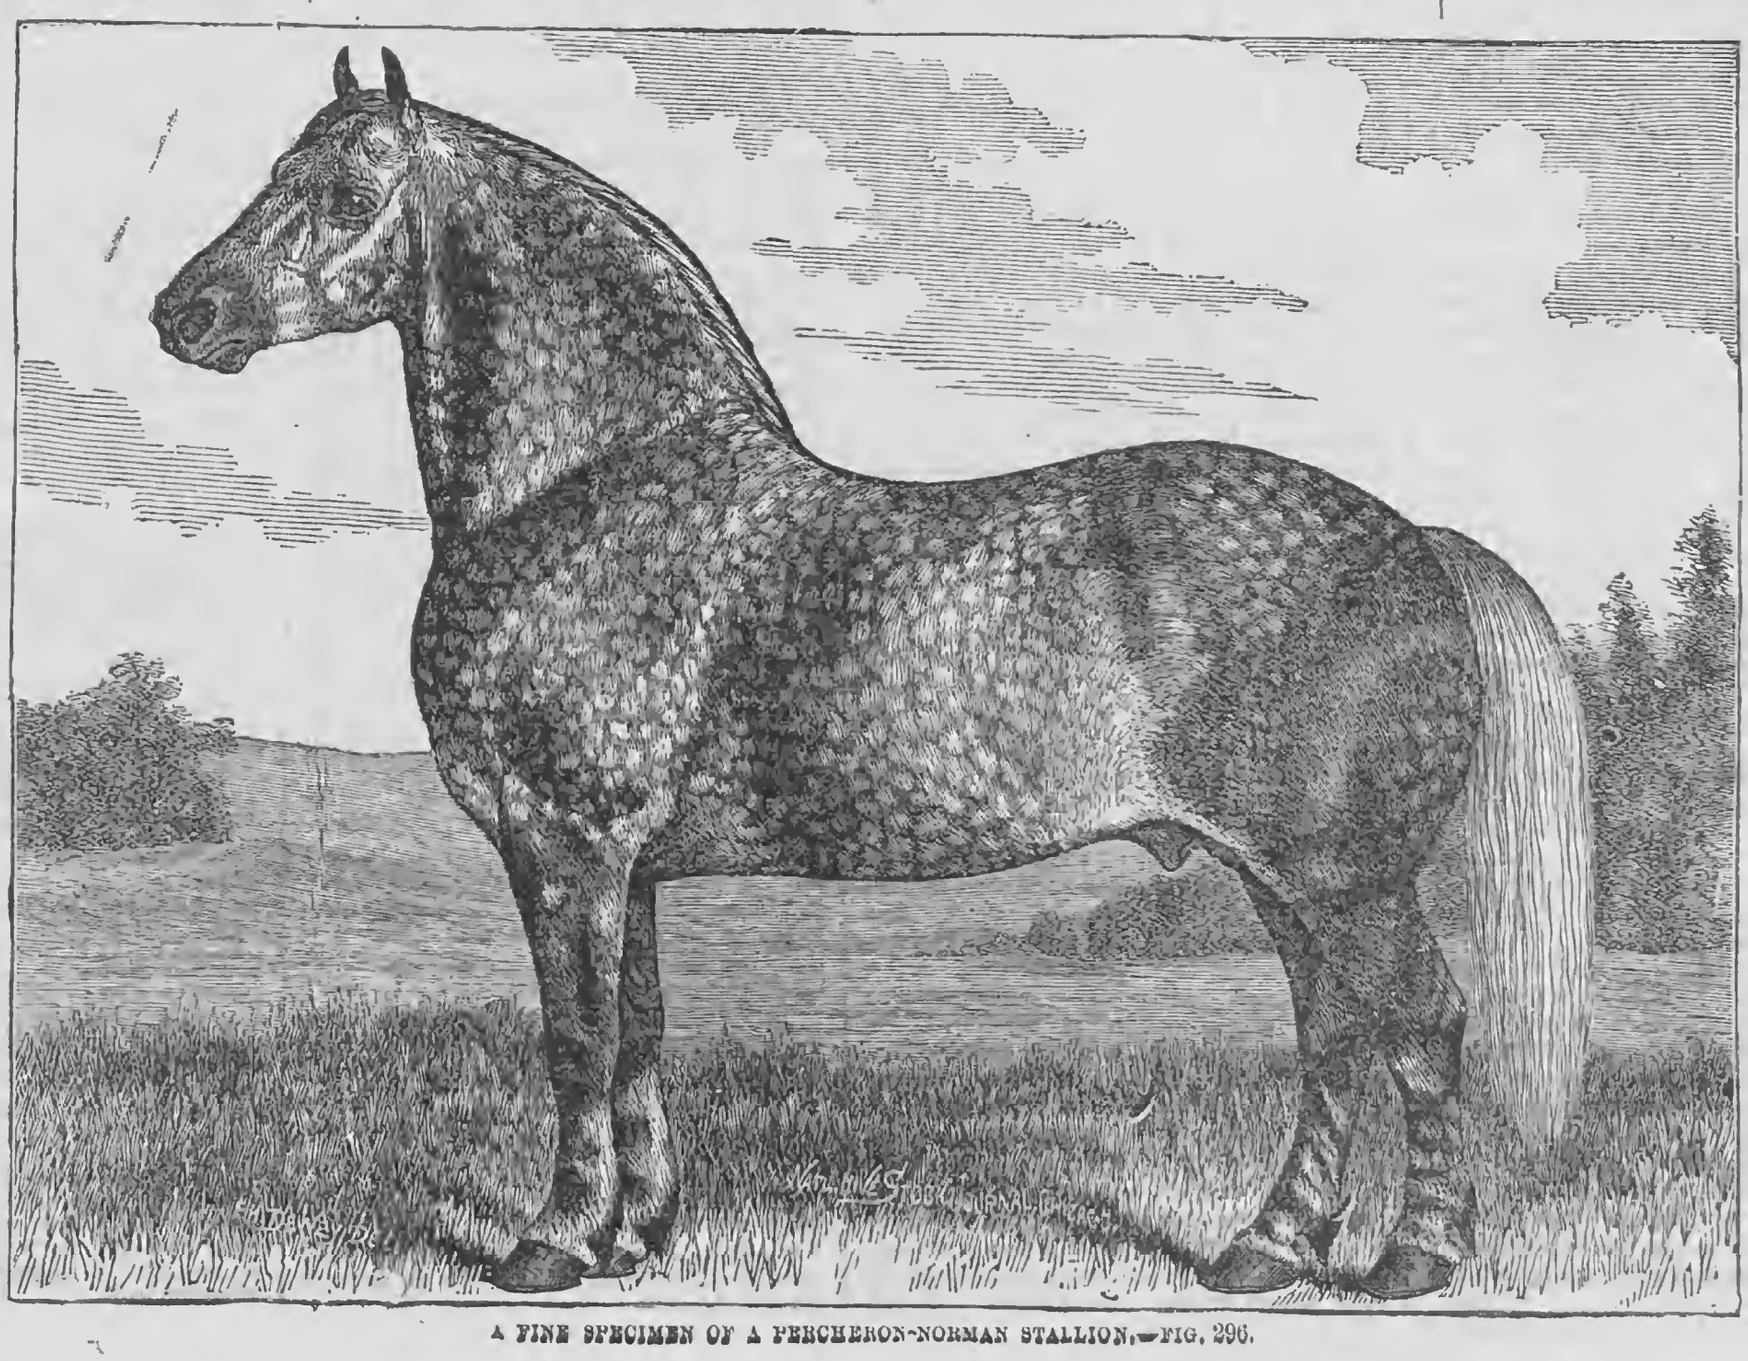
There is a reason for this great superiority over other large breeds, as tradition affirms it originated early in the eighth century, by a cross, on the large native Percheron and Norman mares, of the high-bred, powerful Barb stallions, captured in great numbers from the Moors then invading France. This improvement thus judiciously begun, has been continued down to the present day, by selections for breeding purposes of the best of their progeny, and by taking fresh crosses, now and then, from stout Arabian war horses—cognates of the Barb—brought home from Palestine on the return of the French crusaders. Another thing which has also contributed to the superiority of this class of horses, is, that the climate and soil of Normandy, and more particularly of the Department of La Perche, are admirably adapted for the production of choice stock.

Mr. Harris, of New Jersey, was the first person within my knowledge to import horses of this breed. Traveling in France in the year 1859, and observing the superior qualities of the large, powerful farm and road horses in the Departments of Perche and Normandy, he determined on an importation of one stallion and two mares. These being greatly liked in his native State, and seen by several horse breeders in Pennsylvania, Maryland, and Ohio, they followed Mr. Harris's good example by the importation of a few each. From the last State, they spread into Illinois and Indiana, where, being found so much superior to all other large farm stock, a quick demand at extra prices sprang up for colts bred from the males out of the common mares of the country, and rapid importations from France soon followed. Mr. Dunham, of Illinois, has been by far the largest importer, having brought over from France upwards of three hundred horses within the past few years. The Percheron and Norman grades are now spreading rapidly over the country, from Canada on the north, to Virginia on the south; and from the Eastern States, to those of the farthest West.

These horses stand from 15 to 18 hands high, and weigh from 1,300 to 1,800 pounds. Their superiority over other large European breeds, consists in their ivory-like bones; firm, tough muscles; handsome, powerfully knit, blocky forms; extra-strong joints and limbs; and clear, tough hoofs, well set up at the heels. This last good point enables them to endure stony roads and city pavements better than most of the other larger class of horses. Added to the above, even those of the biggest size are very active, with a fast walk, and reasonably quick trot. They are of great endurance, high spirit, and indomitable courage; yet gentle and docile of disposition, little predisposed to diseases of any kind, and especially those of the legs and feet, to which other larger breeds are so liable.

Of the economy of the use of an extra powerful horse, all will be convinced when they see that one of these can do the work of two of the common kind, and a pair that of four. This saves considerably in stable room, feed, harness, shoeing, and wages, of grooms and drivers, and makes them much more handy as a single team on the farm, and in the crowded streets of the city. If a single horse—as it is well known these can—will turn as deep a furrow and draw as large a load as a pair of smaller ones, it is certainly much more convenient and economical to use such.

The first volume of the Percheron-Norman Stud Book, edited by Mr. J. H. Sanders, was published at Chicago in 1878. This is a handsome work of 212 pages, illustrated with numerous portraits. It was got up for the purpose of recording the pedigrees of all full-bred horses of this class, thus to prevent the public from being imposed upon by unprincipled dealers, by substituting grades for pure-bred. I understand that a second volume of this work is in preparation, and will soon be issued from the press. Half and three-fourths-bred Percheron and Norman horses not only fetch an extra-high price for home use, but also for exportation. The demand much exceeds the supply and is likely to do so for years to come. They are undoubtedly the most profitable stock the farmer can raise, as colts got by these stallions out of good, common mares, are large and strong enough at two years old to be put to light work on the farm. By the time they are four to five years old, and ready for sale for harder work, they will have earned the cost of their production, and whatever price is then obtained for them will be a clear gain to the breeder. Is there anything more promising or profitable than this in the business of stock-raising?



A FINE SPECIMEN OF A PERCHERON-NORMAN STALLION.—FIG. 296.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

31ST ANNUAL FAIR NUMBER.

OUR CLUB OFFERS FOR 1880-81.

THE RURAL NEW-YORKER has never heretofore published a list of other journals with which it clubs. We have, however, for 1880–81, for the benefit of many of our readers, been at great pains to procure the lowest cash rates of the journals mentioned below, so that any of them with the RURAL NEW-YORKER may be subscribed for at very much less rates than the two separately.

The Inter-Ocean and RURAL NEW-YORKER			$2.75
Detroit Free Press	"	"	3.50
Weekly World	"	"	2.75
Globe-Democrat	"	"	2.75
Pioneer-Press	"	"	2.75
Evening Post (Weekly)	"	"	3.20

Any person ordering for one year the RURAL NEW-YORKER and any one of the above Weeklies will receive the Plant and Seed Distribution without application and without charge for postage.

AMONG our potato experiments, one series was conducted to ascertain how far it is best to place the eyes in the hill. We shall give the details in a few weeks. We may now state simply that single eyes placed *six inches* apart produced the best yield.

WHICH is better for transplanting, Spring or Fall? Our answer would be, Spring north of this latitude; Fall, south of it. This has reference to deciduous, fruit and ornamental trees and shrubs. We prefer early Spring to any other season of the year for evergreens.

THERE is a small fortune and a great reputation in store for the ingenious individual who will furnish a cheap, safe and efficient remedy for the European Cabbage-worm. There have been hundreds claimed, but few are of any value, and most are nearly worthless.

AMONG rural pleasures, what is more gratifying and satisfactory than digging potatoes where they turn out smooth, round and large, at the rate of 300 to 350 bushels per acre—provided one has not too many to dig? It is something akin to the gratification of husking corn which yields 75 bushels per acre, or cutting wheat which will make 30 or 35 bushels.

WE have seen complaints made that where bone flour or superphosphate has been used in the hill—in the hill alone—for corn, though the young plants showed unusual vigor, the subsequent growth has proven very unsatisfactory and, in some cases, the crop has nearly failed. Is there anything unaccountable about this? If not, when will farmers learn that neither phosphates nor any other fertilizers in the hill can exert more than a temporary influence? The young rootlets are fed and the young plants thrive. But as the roots extend, there is nothing for them to feed upon, and the old plants languish.

IT has been stated by some of our agricultural papers that one objection to the Southern cow-pea for the North is that the season is too short to admit of their ripening seeds. This is one of those errors that occur from perfunctory experiments. The variety of cow-pea called "Poor Land" ripened seeds at the Rural Farm in large quantities by August 12th. This variety is, indeed, one of the best for Northern fields. The seeds germinate freely and produce an immense amount of vine, which completely covers the earth for a space of not less than six feet. Those who have tried the mixed kinds which we distributed last season, and who would pronounce them a failure are advised to try the "Poor Land." It can be supplied by Southern dealers, and perhaps by Northern ones as well.

THOSE who may feel apprehensions concerning the fate of next year's Winter wheat crop in the West, on account of the severe and protracted drought, may dismiss their fears. Though increasing the labor of preparing the soil in a considerable measure, a Summer and Fall drought is one of the best natural preparations for a full crop the succeeding year. This fact old wheat growers know and recognize in their dealings with the crop, and the result will be a considerable increase of acreage. Thus the accounts tell us that no such crops of wheat have been produced in Macoupin County, Ill, as in '78 and '80, and the same is true of the brown clays of that whole section—a section where a severe Summer and Fall drought prevailed both in '78 and '79, and is in course of being repeated in 1880. Now, so far as Winter wheat is concerned, whatever may be said of the Spring crop, a severe drought is not likely to diminish, but rather increase the acreage; and if the labor of putting in is small, the outcome is pretty sure to be large in proportion.

ORCHARD GRASS AND CLOVER.

A CORRESPONDENT who has a large dairy in the Western part of New York, writes us that he finds Orchard Grass and clover so superior to other grasses for early Summer soiling his cows, that he is going to greatly extend the growth of them by sowings next Spring. He adds that when these grasses are cut early for hay, he much prefers them for Winter fodder for his dairy stock, as he has his cows to calve mostly in August and September, so as to make the greater amount of his butter during Winter. It costs less to make it then than in Summer, and it brings a higher price, thus yielding him a double profit.

In the latitude of 40 deg., and perhaps a little higher, Orchard Grass may be sown as late as the fore-part of September. We sowed it then last year, and got an excellent stand before heavy frost set in, and a large yield from it the past Summer.

OUR PRESENT PROSPERITY.

WHEN an ancient people were released from slavery and established in freedom, it is related that they regretted the time "when they sat by the flesh pots and did eat bread to the full." In like manner there are some persons to-day that are not satisfied with their present condition of prosperity, and look back with regret to the time when, in the flush of a ruinous expenditure of borrowed capital, every man made money, became rich, and dwelt in air castles of the greatest magnificence. The present is an unusual, and in fact, an unexampled season of prosperity, and should be wisely considered and used. We have leaped suddenly from a position of distress to one of comfort and opulence. We have plenty to sell to eager buyers at good prices, and the habits of economy created in our distress have not yet been destroyed by our present easy circumstances.

Let us take warning. "In the day of prosperity be joyful, and in the day of adversity consider." We have had time for consideration in the past, and our time of rejoicing is at hand; but to forget the past and to mourn over the departure of a period of inflation which brought upon us our time of distress is folly and shows that some persons, at least, have not rightly taken to heart the lessons which they have learned. We are in a good, sound, prosperous condition, and we have every promise of a continuance of it, if we still practice the economy, prudence and industry which have brought us to this condition.

TRY IT. HOW TO INCREASE THE YIELD OF CORN.

As a rule among our farmer acquaintances, fair, plump, large ears of corn are selected for seed without any regard to the number growing on a stalk. From our own experiments we deem this a mistake. It is better to save the largest, fairest ears than those which are imperfect or collected indiscriminately. But such selection is just as liable to encourage a lesser as a greater yield in the future crops. Corn is very susceptible to change from selection, as we may know from the scores of distinctly marked varieties known. If we would increase our yield, we must select seed from the most prolific plants. This, which is true of all plants, is especially so of the corn plant. If, further, an isolated plot, as far removed as possible from other corn, were planted yearly for seed and the tassels as soon as they appear were destroyed on both those which were sterile and the least prolific, we doubt not the farmer would, in a very few years, be amply compensated for his pains. In this case, seed would be saved which had on both sides the most prolific parentage. We attribute our immense yield of Blount's Corn at the RURAL'S Farm, in a great measure, to our very careful selection of the seed. There can be little doubt that such selection will in a few years increase the yield of *any* variety of corn. On the other hand, if only the largest, handsomest ears are selected, regardless of the number of ears borne on a given stalk, simply what may be considered the normal yield of the variety will be continued from year to year.

THE DEVELOPMENT OF THE SOUTH.

As we all know, at one time cotton was called King, when it was by far our most valuable crop, and brought more gold into the country than any other. But the recent enormous development of the northwestern country has given only a second place to cotton in our list of exports. Thus, while in 1879 the export of cotton was $182,068,841, that of wheat and flour amounted to $191,136,240, and other agricultural products reached to nearly $200,000,000 more. So that wheat has taken the first position among our soil products, and the great northwestern fields occupy the attention of European countries as their future bread producers.

Still the Southern States doubtless have a wonderful future before them. The product of cotton is rapidly increasing, and during the last 15 years has exceeded that of the 15 years preceding them by 9,600,000 bales, valued at $600,000,000. In addition to this, the value of the cotton seed, now mostly wasted, amounts to an enormous sum, for the 3,000,000 tons yearly produced are equivalent to 90,000,000 gallons of oil; 1,300,000 tons of oil-cake, and 1,500,000 of hulls, which are of value as a fertilizer. The sugar production, too, must doubtless soon increase to a very great extent, for it is enormously profitable. A Louisiana planter made, from 3,287 acres of land last year, a product which sold for $565,000, an average of $175 per acre. Yet the whole crop of that State reached but $19,000,000, while our importations from Cuba amount to more than $80,000,000 yearly. The South wants men and money, and the North has these to spare.

THE HERDWICK SHEEP.

THE London Agricultural Gazette of a late date gives a particular account of this peculiar breed of sheep, ranging the mountains of West Cumberland lying between the Derwent and the Dudden Rivers. Their pasture extends 1,800 feet high above the sea, and is so cold, bleak, and poor that these sheep alone can sustain themselves there. Not even the black-faced mountain sheep, which are next in hardiness to these of all in Great Britain, can do it.

The tradition of their origin is that some 40 of them escaped from a Spanish vessel stranded many years ago on the Cumberland coast. These took to the high hills, and bred and supported themselves so well there that pure flocks of them have been kept up by the owners of the land ever since. They are of small size, finely formed, and wear horns. The lambs come black in color, but as they grow up change to mixed white and black. The ewes do not breed till three years old, and seldom drop twins. Fat wethers attain a weight, when four years old, of 90 to 100 pounds, and shear an average fleece of indifferent wool of three pounds or so. Their mutton is of excellent quality. Draft ewes which are not wanted for the purpose of keeping up a pure flock are bred to Leicester or South Down tups, and the lambs of this cross are taken onto good lowland pastures, where they grow rapidly, fatten kindly, and attain a considerably larger size than those of the pure breed.

We presume no flockmaster would continue to keep so small and slow-maturing sheep as the Hardwicks, were it not that no others are sufficiently hardy to live and thrive on the miserable, scanty herbage and in the cold, wet, bleak climate of the Cumberland mountains. It was at the foot of these that the poets Wordsworth and Southey dwelt, and immortalized the scenery in their admirable verse.

BREVITIES.

READERS are requested to keep this number for reference.

WHETHER we learn little or much at the fair, much depends upon whether we go there to see or to be seen.

THE RURAL NEW-YORKER wants agents EVERYWHERE. The work, we think, will be found easy, and an examination of our premium list will show it to be very profitable.

OUR readers will agree with us that they have never (or rarely ever) seen a higher class of advertisements than are collected together in this Fair Number of the RURAL NEW-YORKER.

THERE are two sorts of agricultural fairs. One is to benefit the farmer. The other is to get his money. The worst of it is that farmers themselves don't put themselves out to discriminate between them.

THE new Turban Tomato has a turban to be sure. In other respects it is much the same as any other tomato. Why this little top-knot should entitle it to a place among larger and smoother sorts is not very apparent. Our first fruit ripened August 10th.

There is nothing more important to successful sweet-potato cultivation than preventing the vines from taking root. This is fully understood in the South, but we find it is often neglected in the North. Just as soon as the vines take root, most of the nourishment beyond goes to the new roots instead of to the tubers forming in the hill.

WE beg that our readers may not mix up the Rural Branching Doura with other Douras, Brown and White Egyptian Corns, China Corn, Rice Corn and the like. We have tried them, and though their grain may be valuable for poultry, etc., they "send up" but one stalk and are not to be recommended as fodder plants.

AMONG the fifty kinds of grapes which we have under trial, "Lady" was the first to ripen its fruit. We pulled plump, ripe bunches of this excellent white grape, August 13 h. Owing to its soft skin and liability to crack, it can never prove of much value for distant markets; but for home use it should be cultivated in every collection.

"GOLDEN-LEAVED" shrubs and trees are much written about. But, as a matter of fact there are few worthy of the name. We have the Golden Oak, Golden Spiræa, Golden Catalpa. In early Spring their leaves are of a beautiful yellow—but this changes to green as soon as the leaves attain their mature size. We know of but one hardy plant that can fairly be called "golden" and that is the Golden Elder. Its leaves are golden throughout the entire season.

THE disputed question as to whether glass insulators or insulators of any kind are necessary in order to give lightning rods their greatest protective power, is one that common-sense ought to be able to settle. We employ lightning rods because they are better conductors of electricity than the materials of which our dwellings are built. It is plain, therefore, that insulators are of no use whatever. The wiser plan would be to *connect* all iron parts of a building *with* the rod.

PRESIDENT T. T. LYON advocates a rule at fairs, rigidly enforced, forbidding any person handling the fruit on exhibition except by authority or permission. The rule should be printed and posted up where all could not help but see it. One or two severe examples made of transgressors would soon cause it to be respected. Fruit men themselves are the worst to manage. Even they should be prevented from handling their own fruit after it is once in place.

IT will be remembered that the Editor of the Germantown Telegraph and the Editor of this journal had a little controversy as to the exact value of weevil-eaten peas. A wager of a large amount was made and accepted and a fair trial made by the Editor of the Telegraph, which determined the question in the latter's favor. Upon receipt of the wager Maj. Freas, the venerable Editor, replies:

"Many thanks for the $500,000. Of course, I expected nothing. I will use it in remembrance."

OF all the wheats we tested last season, "Fultzo-Clawson bore the largest, heaviest kernel, though it did not yield as much as many others. We often distrust the reputed parentage of so-called "hybrid" plants. We are satisfied that the parentage of many new sorts of potatoes is merely guessed at, owing, as we said before, to the extreme difficulty of procuring pollen from the anthers of the flowers. But the Fultzo-Clawson shows a marked likeness to both parents. We hope under continued cultivation it may prove as prolific as the kernels are heavy.

EXPERIMENTS, though they usually require a deal of care and time, sometimes result in great benefit to the farmers who conduct them. For years past we have deemed Clawson wheat the most productive variety we could raise at the Rural Farm. The past season we have raised 25 different varieties of wheat, each upon a plot one-fortieth of an acre in area. Among them we believe there are no less than three kinds which will yield more heavily and make a better quality of flour than Clawson. (The matter is referred to elsewhere.) It is a question whether this discovery will not more than pay us for the cost of the experiments.

A SEVERE struggle is likely to occur in Congress during the next session between the brewers and malsters on the question of the import duties on Canadian and other foreign malt. The tax now is 20 per cent. *ad valorem*, and last Spring the malsters urged that it should be raised to 25 cents per bushel. Their earnest work had nearly secured the passage of the bill, when the brewers were aroused and started a vigorous opposition, on account of which final action was deferred until next session of Congress. About 50 000 000 bushels of malt are now used in this country, and of this large amount it is said only 500 000 bushels are imported. As between these conflicting interests we have no care in the matter, but the question is one that has some bearing on the price of home-raised barley, and therefore we cannot allow it to pass without calling public attention to it.

The Free Plant
AND
Seed Distribution
OF THE
RURAL NEW-YORKER
FOR 1880–81.

THE RURAL NEW-YORKER has introduced or disseminated among the farmers and horticulturists of our country among many different kinds of Seeds and Plants the following which are now widely, and for the most part favorably known:

The Cuthbert Raspberry,
Blount's White Prolific Corn,
The Beauty of Hebron Potato,
Mold's Ennobled Oats,
Defiance (Spring) Wheat—Champlain (Spring) Wheat—Clawson (Winter) Wheat,
THE ACME AND GOLDEN RURAL TOMATO,

ARGENTEUIL ASPARAGUS.

"There was scarcely a day this year when, for one bundle of English Asparagus to be found in Covent Garden, one could not find four hundred bunches of Argenteuil"
[See article of Mr. William Robinson, Editor of the London Garden.]

A New Era in Asparagus Culture.

Giant Dutch Purple Asparagus.

WASHINGTON OATS.
Large Panicles—Heavy Weight.

TO THE LADIES.

The Choicest Strains of Chinese Pinks, Carnations and Picotees.

Including "Eastern Queen" and "Crimson Belle" which were sold last season by our first seedsmen at 50 cents each per packet of a few seeds.

NOTES FROM THE RURAL GROUNDS.

FOR the information of the many into whose hands the present number of the RURAL NEW-YORKER may fall, and who may see it for the first time during the past three years, or since it has been under its present management, it may be well to state that the Experiment Grounds owned by this journal and worked, in so far as this is possible, in the interests of its subscribers, consist of eighty-two acres. Eighty acres situated in Queens Co., L. I., comprise the farm where all new agricultural seeds of special promise are tested. Thus, during the present season we have tested 35 varieties of wheat; 70 of potatoes; 11 of cow-peas; 10 of corn; 6 of oats; 6 of fodder plants, etc., etc. Two acres and a fraction, situated in Bergen Co., New Jersey, are devoted to experiments with all sorts of hardy ornamental trees and shrubs, small fruits, grapes, etc., etc. Since we have neither plants nor seeds to SELL, since, indeed, we have no other interests to subserve save those of our readers, our reports of the results of our tests are fully accepted as trustworthy, and the true value of hundreds of new and high-priced seeds and plants is made known. When, by such tests, we find that a given plant is more valuable than others of its kind which have been generally cultivated, we, at once if practicable, place it in our next Distribution, and send it without charge to all of our readers who apply. These distributions are

ABSOLUTELY FREE.

It is true we seek thereby to extend the influence of our journal; but our FIRST aim is to benefit the agricultural and horticultural interests of our country, and we beg to state that the means of the RURAL NEW-YORKER are such that the cost of our Distribution is not permitted to stand in the way of an introduction of varieties that either cannot be procured elsewhere, or, if they can, only at a high price.

POSTAGE.

As our readers well know, we have heretofore borne a part of even the postal expenses of the seeds and plants we have sent out. We might have been excused, perhaps, had we required that our subscribers should bear this cost themselves. But these offerings *are not premiums*, and we desire to *hold the right to continue or to discontinue them as we may determine.* The postal cost of our next Distribution, as nearly as we can at present estimate it, will be not less than 12 CENTS. We shall divide this amount with our subscribers—charging them six cents and paying the rest ourselves, the trustworthy firm that will control it, that the price will be ONE DOLLAR (or more) PER POUND.

One of these potatoes of MEDIUM size will be forwarded to each one of our subscribers who apply, *packed in saw-dust* in a PASTE BOARD BOX. *The cost of this item alone in our Distribution—box, packing, labor, potato and postage—will exceed* $1200.

THE RURAL BRANCHING SORGHUM.

We began testing this the same season that Pearl (Cat-tail) millet was grown at the RURAL Grounds. But so great was the fuss made over that plant, that the merits of the other were overlooked. We should have placed it in our Free Distribution last year but for the reason that the seed in sufficient quantity was not to be procured.

We quote the following from the RURAL of Dec. 27, 1879:

"This" (RURAL Branching Sorghum), "as we believe from the test of a single season, will prove of great value as a fodder plant. The plants *averaged eight* stalks from a single seed under very ordinary cultivation. The leaves are broad and long. The average hight of the stalks, Sept. 20, was nine feet. July 20 one row which was then four feet high, was cut five inches above ground. Each stalk continued to grow, and the average hight was six feet Oct. 1st when all was cut.

"Cattle and horses, fowls and pigs relish this even better than corn stalks and leaves, and eat the stalks entire, which are perceptibly sweeter than those of corn. While corn was prostrated by high winds which occurred twice during the growing season, every stalk of this remained as upright as ever. (See RURAL of above date for engraving of panicle and a section of leaf.)"

RURAL BRANCHING SORGHUM.

We beg that our readers will not confuse this variety with other so-called Douras, Egyptian Corns, China Corn, etc.; which have for years past been talked of and highly commended in some quarters. They are of little value as fodder plants, however, bearing but one stalk from a seed and generally a drooping panicle. It should be remembered that Sorghum vulgare, of which the RURAL Sorghum, as well as the others mentioned, are varieties, breaks, under cultivation, into as many varieties as Indian corn, and just as in corn, such varieties may be grouped by some striking peculiarity. The great points of *this* variety are:

1 Its suckering or branching proclivity.
2. The firm hold it takes upon the soil.

SALIX PENTANDRA,
Moluccella Lævis,
HYBRID PENTSTEMONS,
IRIS LÆVIGATA—GOLDEN OVOID MANGEL—RURAL HYBRID RICINUS, ETC., ETC.

A Remarkable and Valuable List for the Coming Year!

THE WHITE ELEPHANT.

We believe it will prove the best Potato Known

THE LARGEST SIZE!
THE BEST QUALITY!—and give
THE GREATEST YIELD!

The Rural Branching Sorghum!

A new variety of Sorghum vulgare that produces an average of seven stalks from a seed, and may be cut twice in this climate. Testimonials that it will prove of

Great Value as a Fodder Plant.

Tested at the RURAL Grounds and RURAL Farm; in the South and in the West.

THE WHITE ELEPHANT POTATO,

the first of our present announcement, was produced from a seed ball of the GARNET CHILI, fertilized with pollen from the WHITE PEACH-BLOW. Without hesitation we join those who will next season offer this potato for sale, in saying that it combines the best qualities of its parents; viz, amazing productiveness, excellence of quality and flavor, and keeping qualities unsurpassed by any other variety. Notwithstanding their great size, the tubers are ALWAYS SOLID. They grow closely together in the hill, ripening with the Late Rose. Last season the originator planted one bushel (sixty pounds) of the White Elephant on one-eighth of an acre of ordinary soil, and therefrom harvested FIFTY SEVEN BUSHELS! Our own report of the yield at the Rural Farm, as well as reports from many different parts of the country whither seed has been sent for trial, will be presented in these columns later. From our present knowledge, we believe the White Elephant will prove itself to be

☞ OF THE LARGEST SIZE
☞ OF THE BEST QUALITY—and
☞ ONE OF THE GREATEST YIELDERS

known.

When offered for sale, we are informed by

3. Its abundance of leaves.
4. The sweetness of the stalks.
5. Its continued growth after being cut.
6. Its power to resist drought.

We have tried this Branching Sorghum both at the RURAL Farm and RURAL Grounds for two seasons, with such success that we cannot think otherwise than that it is destined to take a high and permanent rank among the forage plants of our country. Its suckering habit is remarkable. The plant from which our engraving was made had 12 distinct stalks. We have, however, counted upon a single plant as many as 19, specimens of which may now be seen at the RURAL Farm. The engraving is reduced to one-quarter of the natural size, as it then (July 1st) appeared.

THE ARGENTEUIL AND GIANT DUTCH PURPLE ASPARAGUS.

It is strange that, in this country at least, no extended, careful experiments have been made to produce new and superior varieties of asparagus, the choicest vegetable, perhaps, that grows. We do not know that our efforts in this direction will be attended with any success. Perhaps there is but one kind, and that all variations are due to climate, culture, or both. Be this as it may, we have forwarded our orders for a sufficient quantity of both the Argenteuil (the French kind) and the Giant Dutch Purple, to supply all of our readers who may apply, with enough seed to plant a goodly-sized plot. Both of the above varieties are in appearance very distinct from ours, the one being of a silvery, the other of a purple color. Whether they will reproduce themselves from the seed remains to be seen. We doubt not that our subscribers will heartily join us in the test. We ask them to read the article of Mr. Robinson, which will be found in the Fair Number of the RURAL NEW-YORKER.

Picotees, Carnations, Chinese Dianthus.

(Dianthus Chinensis and Caryophyllus.)

It has been a difficult matter—almost vexatiously so—in the selection of our FLOWER seeds, for the RURAL's distributions, to hit upon those which were of the first value and yet free to germinate in the amateur's hands. Many of our subscribers have from time to time written us that their *flower seeds* failed; while all the others succeeded well—as if the fault were with the SEEDS! But we must unqualifiedly insist that this is simply impossible, as the multitudinous and trustworthy reports in these columns of those with whom *all the kinds* we have sent out have germinated, will fully attest. Different seeds to germinate require different conditions and treatment, in the absence of which, they must as surely perish as if they had been thrown into the fire. In the present instance, however, we have accepted the happy suggestion of a friend, and imported kinds which, while they make the most beautiful of plants, whether for out or in-door culture, will germinate and grow as readily as the seeds of the cucumber or beet. These seeds, the best of their kinds, have been added to our present distribution, then, for the benefit of all, but more especially for the benefit of those who have either failed or found it difficult to succeed with other flower seeds which exact more experienced culture. We have selected, therefore, a careful assortment of the Chinese pinks; of carnations and picotees. Among them will be found the following kinds, which are probably as beautiful and effective as any plants of their class in cultivation. No others are more fragrant; none better suited for cut flowers; none more captivating for house culture:—First (in one packet mixed) we shall send:

Dianthus Chinensis Heddewigii,
" " albus fl. pl.
" " striatus,
" " "Eastern Queen," and
" " "Crimson Belle" tested here (Rural Grounds) last year.
Dianthus Chinensis imperialis.
" " laciniatus.

In a second package, the following kinds will be found.

CARNATIONS. Seeds raised from choicest varieties—scarlet, white, yellow.
PICOTEES. Seeds saved from double flowers.

We hope the above, in a different way, may in the end prove as popular with our readers as the Chater strain of hollyhock, which we sent out several years ago and which are now so highly and justly esteemed.

For a number of years we have here cultivated the Chinese pinks. They bloom the first season if started early and during most years will stand the climate and make a fine display the second year. A covering of fine manure is, however, desirable.

WASHINGTON OATS

were received in Washington Co., N. Y., three years since from Illinois, where they were found growing in a wheat field that was sown with wheat imported from Germany. The introducer says he has tried nearly all the new varieties of oats and considers this by far the best yet introduced, yielding one-third more than the common oat. The grain is very handsome and heavy, weighing about 42 pounds to the bushel. The straw is very stiff and heavy. On rich soil where most varieties are liable to lodge, the introducer says that these always stand until fully ripe. This quality is of great value, as any cultivator will readily see. Now we do not pretend to know anything about these new oats from our own experience, not having tried them. But the specimen sheaf sent to the RURAL office is by far the finest sample of oats we have ever seen. The straw is heavy and five feet in hight, with a remarkably large number of oats in a panicle. Had we not been thus forcibly struck with the seeming value of this new variety, we should not, two years successively, have placed oats in our Distribution. The specimen sheaf may be seen at the RURAL office.

PLEASE NOTE.

Only yearly subscribers are entitled to apply for this Distribution.

Two three-cent stamps *must be* inclosed in the letter of application or we cannot agree to fill the order. Our object in bearing half of the expense is, as heretofore, to prevent the possibility of a suspicion that we receive in *any form* the slightest compensation for our labor or for the heavy cost of the undertaking. As stated elsewhere, however, we have made such arrangements with the Chicago Inter-Ocean, Detroit Free Press, N. Y. World, St. Louis Globe-Democrat, St. Paul Pioneer Press, Weekly Cincinnati Gazette, Elmira Advertiser, New York Evening Post, and several others, as will be seen, that those who order those journals *with* the RURAL NEW-YORKER will receive the seeds WITHOUT application and without the postage, that being included in the CLUB PRICE, to simplify matters.

Each letter of application will be NUMBERED when received, and the seeds and plants will be sent in that order.

It will save us trouble, and it will save our subscribers trouble and expense if they will make their application for the seeds and plants in the same letter in which they renew their subscriptions. We would also thank them merely to say, "SEND SEEDS." Those two words will convey all the instructions we need.

All questions appertaining thereto should be written on *separate slips of paper*, otherwise there is a chance of their being entirely overlooked, or, at least, of not being promptly answered.

Finally, in order to provide against the possibility of mistakes, disappointment or any dissatisfaction, we agree to duplicate all orders that from any cause may have failed to reach their destination at the close of the Distribution, which will be the latter part of next Spring. The most careful details of instruction as to the treatment of the seeds, will be given in future numbers of the RURAL NEW-YORKER.

THE White Elephant potato — the Rural Branching Sorghum—the Argenteuil and Dutch Asparagus — the Chinese Dianthus, Picotees and Carnations in great variety and of the the choicest kinds—the Washington Oats make up, as will be seen, our Plant and Seed Distribution of the present offering. All are new to this country except the Dianthus, and among them will be found several new strains. All of our readers who apply must give them careful tests, in which case we feel confident that their reports will prove them to be—as many others of the RURAL's seeds and plants have been—the most valuable of their kinds in cultivation. So may it prove—for this is the chief—almost the only object we have in their costly distribution.

IT will be useless for any persons to apply for our seeds or plants unless they are yearly subscribers. The reasonableness of this restriction will appear without further remark. We might be willing, or even desirous, to supply our seeds to all who read our announcement; indeed we would be glad to do so since there is no more effectual way of promoting the interests which the RURAL has at heart. But this is obviously impossible. Hence we strictly limit our distributions to subscribers.

We desire to make it plain, also, that our seed and plant distributions are in no sense *premiums*. As it is optional with us whether we offer them or not, it is our privilege to state when the distributions shall begin and when they shall be discontinued, so long as we liberally fulfill every obligation to which we commit ourselves.

WE presume there are few readers who will not find something to interest them in our new premium list. It will offer valuable presents to all who send us subscribers, whether two, a dozen or a hundred. We have made these presents more valuable than ever before, desiring to reward those who increase the RURAL's influence as liberally as we can afford so to do.

THE RURAL NEW-YORKER began its existence in 1850. Age without its infirmities; age with its experience and with the enthusiasm of youth are what we modestly claim for it now.

SEVEN subscriptions ($2 each, our only price) will entitle the sender to one copy of the RURAL NEW-YORKER for one year.

THE

Rural New-Yorker.

A Representative American Farm, Garden and Home Journal conducted to meet the wants of the times.

For the Thinking, Progressive Farmer and Horticulturist.
For the Suburban and Country Home.
For the North, South, East and West.
Bright, Sparkling, Conscientious, Impressive, Original.

THE BEST WRITERS OF AMERICA AND ENGLAND.

Praises and Congratulations from all Quarters.

T. H. HOSKINS, M. D., Editor of the *Vermont Watchman* says:
"The *Rural* is emphatically a live paper, and a live *farmer's* paper, too, in all the term implies,—which to us includes a great deal that is given the cold shoulder by most agricultural journals. The *Rural* seemed good enough a year ago, but it is fifty per cent. better this year. We have not heretofore praised the *Rural* as we felt it to deserve, because of our own relations with it as a contributor. Now we have said what we think, and if anybody desires to attribute it to any but an honest motive to do justice to the best agricultural and domestic paper in the world, why, let him."

Mr. A. B. ALLEN, the founder of the American Agriculturist says: "I think you are publishing the smartest paper in the country, and also the most suitable, useful and interesting to the rural population."

Five hundred engravings yearly of all kinds of fruits, farm and garden helps, the choicest of our trees and shrubs; of farm animals and rural buildings. Everything for the Country Home.

DR. E. LEWIS STURTEVANT, says: "*The Rural New-Yorker has the best list of contributors of any paper of its class in the country and is doing a noble work.*"

PROFESSOR W. J. BEAL, of the Michigan Agricultural College: "*The Rural New-Yorker is now the best paper.*"

PROFESSOR E. M. SHELTON, of the Kansas Agricultural College: *The Rural New-Yorker has more influence and is more quoted than all the rest put together.*"

PRES. T. T. LYON: "*The Rural is the best paper I see.*"

IT WILL HELP YOU TO MAKE MONEY AND TO SPEND IT JUDICIOUSLY.

"I cannot afford to do without it," is the comment of hundreds of our subscribers.

B. PICKMAN MANN, of Cambridge: "*For years I have taken the leading agricultural journals and they all seem tame when compared with the Rural New-Yorker.*"

SUBSCRIBE FOR IT AS A MEASURE OF ECONOMY.

SUBSCRIBE NOW!! A $4.00 PAPER FOR $2.00 PER ANNUM. NO CLUB PRICES.

It will interest and instruct every member of the household, and it is the earnest desire of the management that it shall in every way prove worthy of the unqualified trust and respect of its readers.

"*The Rural New-Yorker is not afraid to tell the* TRUTH *in the interests of Agriculture and Horticulture, no matter whose individual toes it treads upon.*"

PETER B. MEAD, Ed. *Horticulturist.*

"*The crop specials of the Rural New-Yorker are invaluable to the country.*"

JAMES M. THORBURN & Co.

All novelties are tested at our Experiment Grounds, and reported upon impartially.

Every family that owns or hires a square rod of ground needs the *Rural New-Yorker*, and will be repaid ten-fold by its trustworthy advice. Such is essentially the testimony of thousands throughout the country.

The *Rural New-Yorker* is conscientious, alive, practical. It is acknowledged by leading men to be

THE FIRST AMERICAN AUTHORITY IN ITS SPECIAL FIELDS OF INQUIRY.

For the Country, Village and City; for everybody that loves his home and desires so to elevate agriculture and horticulture that they shall be recognized as the noblest pursuits of men; for the market gardener, the florist and nurseryman, the fruit grower, the small fruit culturist; for the largest farms, the smallest flower plots; for the herdsman, the dairyman, the apiarian, the scientist, everywhere. No sectional prejudices.

FARM AND HORTICULTURAL GROUNDS OF 82 ACRES WORKED IN THE INTERESTS OF SUBSCRIBERS.

The Free Plant and Seed Distributions have been worth more to Subscribers than the subscription price of the Paper.

It will aid you to make and to save money. It will tell you what new varieties of seeds and plants to select without regard to advertising interests.

Special Departments devoted to the News of the Week, to Women, Domestic Economy, to Religious Matters, Fashions.

Trustworthy MARKET REPORTS FROM ALL CENTERS a specialty.

THE COMPLETE NATIONAL FAMILY JOURNAL.

Address, THE RURAL NEW-YORKER, 34 Park Row, New York.

1881.

PREMIUM LIST

OF THE

RURAL NEW-YORKER

The Most Popular Rural Journal in America.

The only paper that Owns and Operates an Experiment Farm and Horticultural Grounds in the interest of its Subscribers.

31st year of its age---4th year of its present Management

Valuable Premiums offered to all who assist in increasing its Circulation for 1880-81.

THE MOST LIBERAL PREMIUM LIST YET OFFERED.

All Readers and Agents are Solicited to examine it carefully.

GENERAL INSTRUCTIONS.

Any respectable person may act as agent.

Send subscriptions as fast as taken (with exact amount, viz., $2.00), and if seeds and plants are wanted by subscriber, send six cents additional *for postage on seeds*, or the subscriber himself may apply for plants and seeds.

Old and new subscribers count in clubs, and they may be sent from different post-offices.

Specimen Copies and Posters supplied FREE on application, for Canvassing purposes.

All premiums are sent at the expense of the agent, unless otherwise noted.

As a rule, we prefer to send articles by express (we consider it safer), but any mailable article will be sent by mail, with or without registry. If the latter, it is at the agent's risk. If the former, the registry fee must accompany the order.

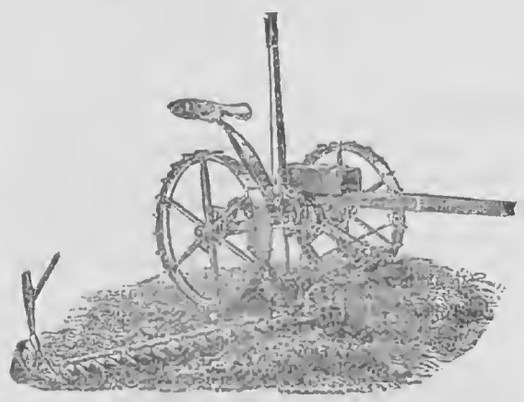
Send money by postal money order, express, check or draft on New York, always payable to the order of THE RURAL NEW-YORKER. If inconvenient to do this, send by registered letter. Every postmaster is *compelled* to register letters. As a rule, money sent by letter without registry reaches us duly. But money so sent is at the risk of the sender.

OUR ONLY TERMS.—Yearly subscription postpaid (52 weeks), $2.00; half-yearly (26 weeks), $1.10. Payments invariably with the subscription. This Premium List holds good until July 1st, 1881.

PREMIUMS.

No. 1—Walter A. Wood's Mower.

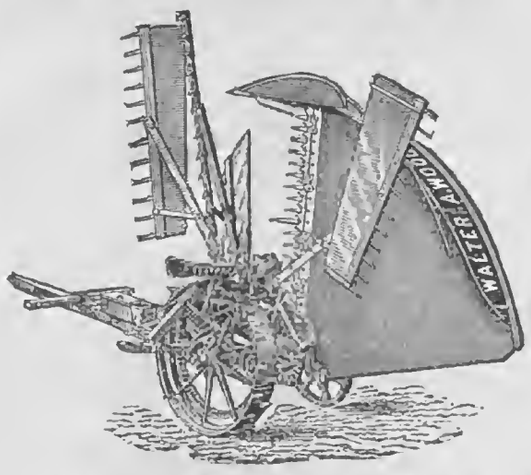
In this machine, simplicity in construction, lightness in weight, symmetry in form and elegance in finish, are combined with strength, durability and efficient working qualities. Needless machinery traps are avoided. It is less complicated, easier to repair, and less liable to get out of order than any other



mower. The one represented by the above illustration has a 4 ft. 8 in. cut, and is fully warranted. The manufacturers of this machine have received a great many medals of honor, both in this and foreign countries and all are well deserved and honestly won. Price of the above mower $85. Given for a club of 100 subscribers at $2 each.

No. 2—Walter A. Wood's Junior Sweep-Rake Reaper.

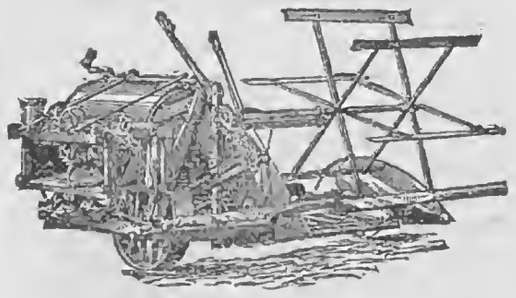
This machine was brought out in Europe in 1872, and in this country in 1875. Since its introduction its success has been rapid and uninterrupted, its sales in that period having reached a very large number, both here and abroad. The steady increase in sales from year to year, and the victory it has won in field contests, demonstrate its merits beyond any encomiums of ours. Taught by practical experience in the field, the manufacturers have strengthened this machine from year to year—the most important improvements having been



made in 1878, by adding the fifth rake, and the automatic device for completely controlling the rakes. There are many valuable points of excellence about this machine, which space at this time will not permit us to mention; but we confidently believe that whoever is fortunate enough to secure one of these machines will feel entirely satisfied with it. We give the Junior with 5 ft. cut; price, $125 for 150 subscribers, at $2 each.

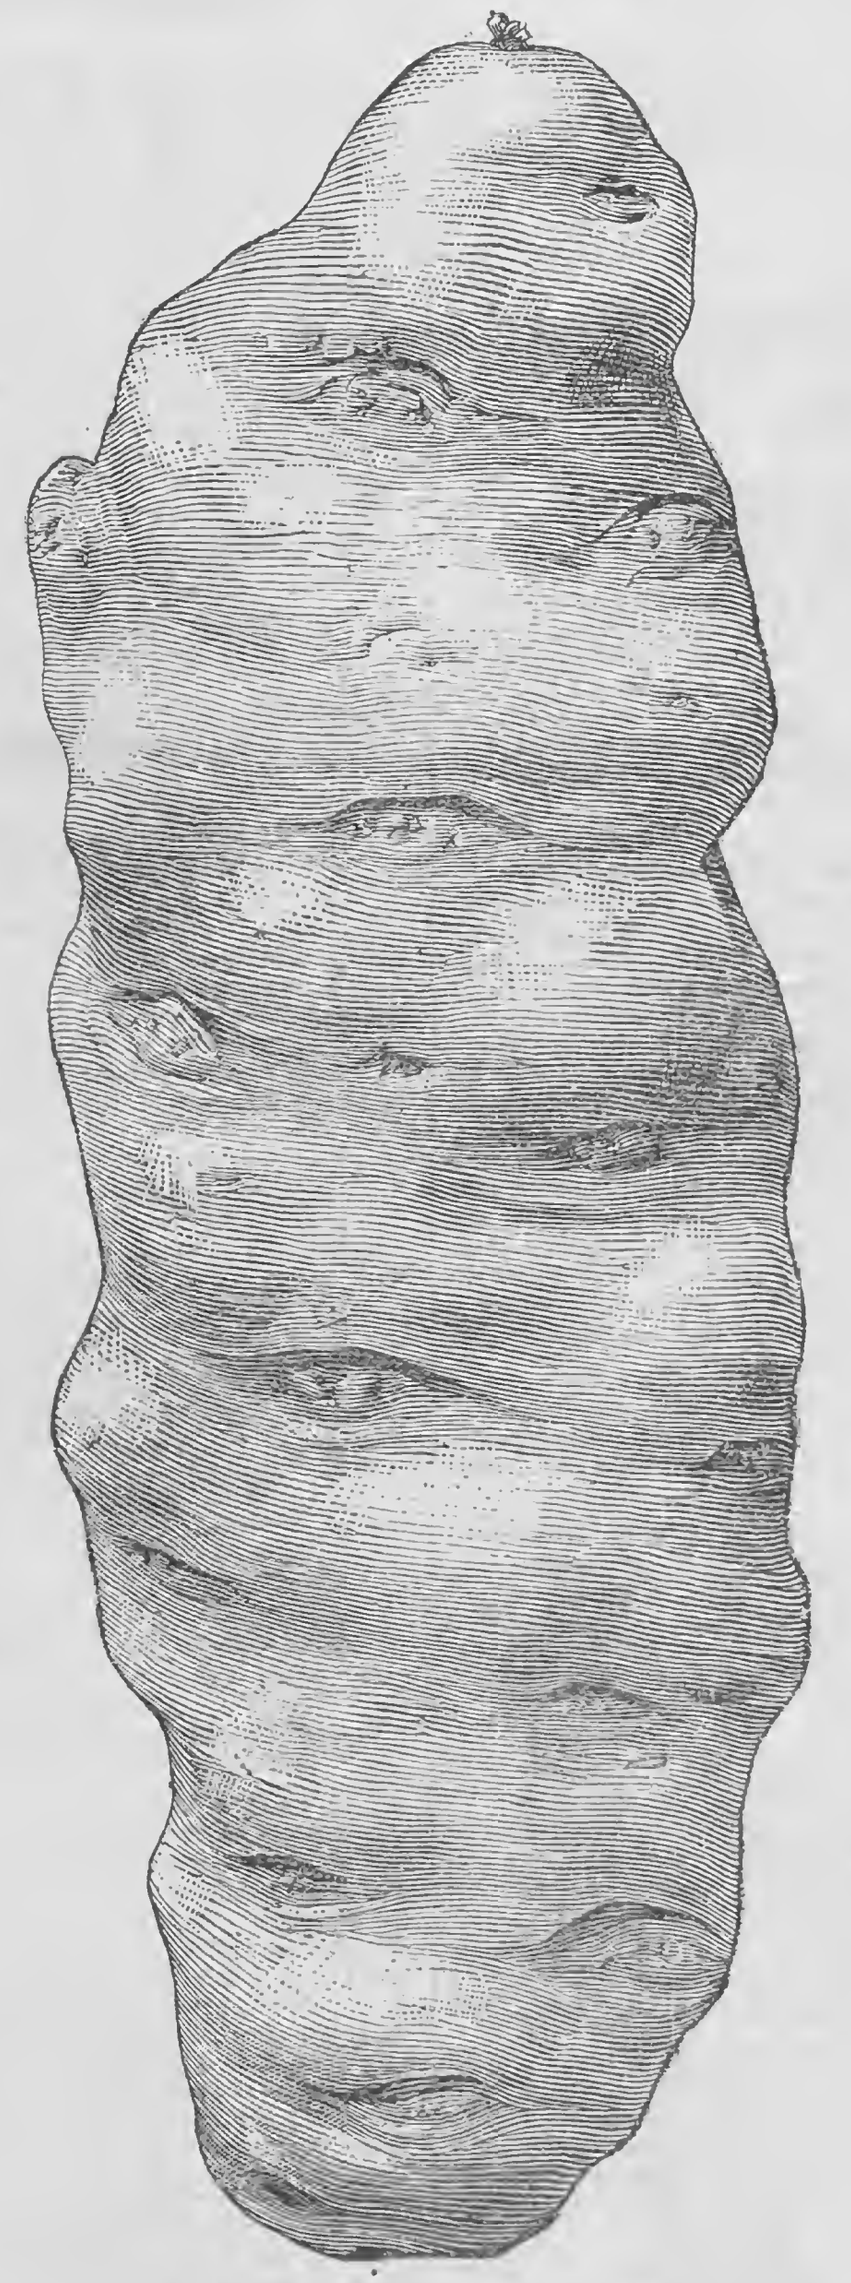
No. 3.—Walter A. Wood's Automatic Twine Self-Binding Harvester.

This machine is put upon the market for 1880 to meet a growing demand for a self-binder that uses twine as a material for binding, instead of wire. It has been thoroughly tested on different kinds of grain and has proven itself a machine with superior qualities as a harvesting and binding machine; and the manufacturers, confident of their superior merits and the de-



mand already for them, have taxed the capacity of their large manufactory in meeting the demand. 4,000 of these machines are already in successful operation and the sales are still increasing. It certainly would seem that *perfection* was finally reached in this harvester, and in offering it to our friends we feel fully confident that whoever may secure this premium will be fully and entirely satisfied with the prize. Price $300. Given for 300 subscribers.

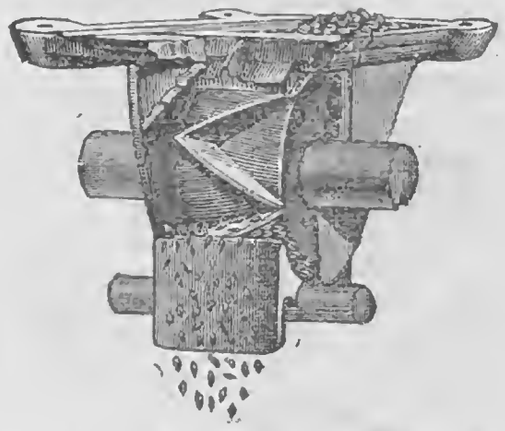
The above machines (Nos. 1, 2 and 3) are supplied to us by the Walter A. Wood Mower and Reaper Co., Hoosick Falls, N. Y., a firm established in 1853, and to-day one of the largest manufacturers in this country. They have steadily increased in business every year since they started, and have made and sold over 350,000 machines during the past quarter of a century. This fact is sufficient guaranty that we are using nothing but the best machines in the market for our premium list.



THE WHITE ELEPHANT POTATO FROM LIFE.—FIG. 305.

No. 4.—Farmers' Friend and Fertilizer Drill.

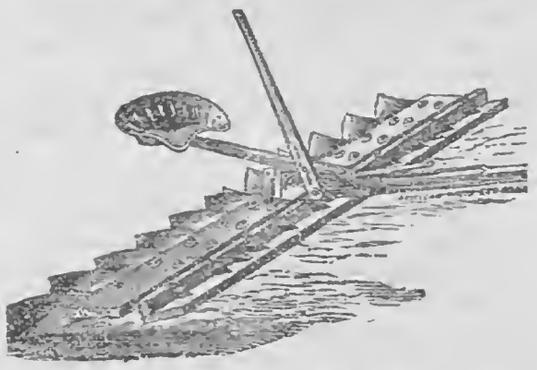
Made by the Farmers' Friend Manufacturing Co., Dayton, O. For 12 years this drill has been before the public, and its essential features remain to-day as when it was introduced. The manufacturers, after years of careful study, put this drill upon the market, and so nearly perfect was it that the principles of its construction first adopted have been adhered to. The illustration shows the seed-cup and its force-feed principle, which, with the patent



cone gearing, enables one to sow any kind of grain in any condition, with perfect regularity. We offer one of these excellent drills, COMPLETE; that is, a nine-hoe, eight-inch drill, with spring hoes, fertilizer and grass-seed attachments, rear hoe-shifter, and land-measurer, for 140 subscribers. Price $115.

No. 5.—Acme Harrow.

Manufactured by Nash & Brother, 22 College Place, New York, and Harrisburg, Pa. This excellent implement, the invention of a man who is himself a practical farmer as well as mechanic, who had previously invented the revolving disk or wheel harrow, seems destined to win a wide popularity. Its sale during the present season has grown rapidly, and testi-



monials, unsolicited, come from every source, highly commending it and praising the workings of this implement.

It is one that combines a clod-crusher, leveler and harrow all in one. It is invaluable for all purposes where a harrow is needed, and is particularly adapted to *hard, inverted sod*, and to ground which has become packed and baked after plowing, as well as to leveling rough land. We have tried one of them on the Rural Farm, and can fully indorse all the manufacturers claim for it. Price $22. Given for a club of 40 subscribers, at $2.

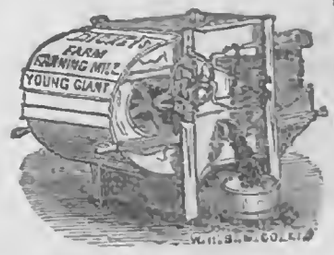
No. 6.—Noyes' Hay Carrier.

Our farmer friends, we are sure, will be delighted with the offer here made. This carrier

has stood the test of many years and has given entire satisfaction. It has been exhibited at a great many fairs and has received many first premiums. It can be used for unloading either within or without the barn, and for removing hay from, as well as putting it into, the barn. It can be used equally as well for stacking in the open field, with a very little expense for the stacking frame. A very useful and practical machine. Price $10. Given for a club of 20 subscribers at $2 each. Made by the U. S. Wind Engine and Pump Co., Batavia, Ill.

No. 7.—Dickey Fanning Mill.

We could hardly have chosen a more useful or practical premium than the one here offered.

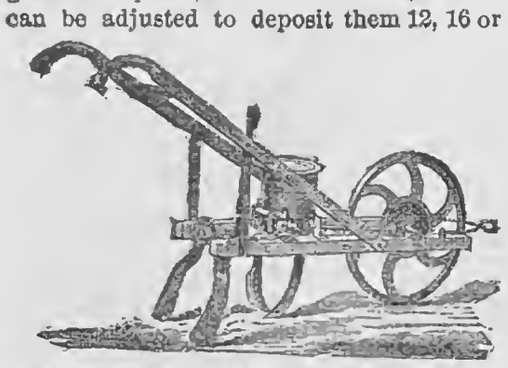


This mill is noted for its simplicity of make, great capacity for separating and cleaning grain, ease of operation and management, its grading and saving qualities, and great durability. In separating oats, wheat, barley, or other grains it has no superior, doing the work both rapidly and

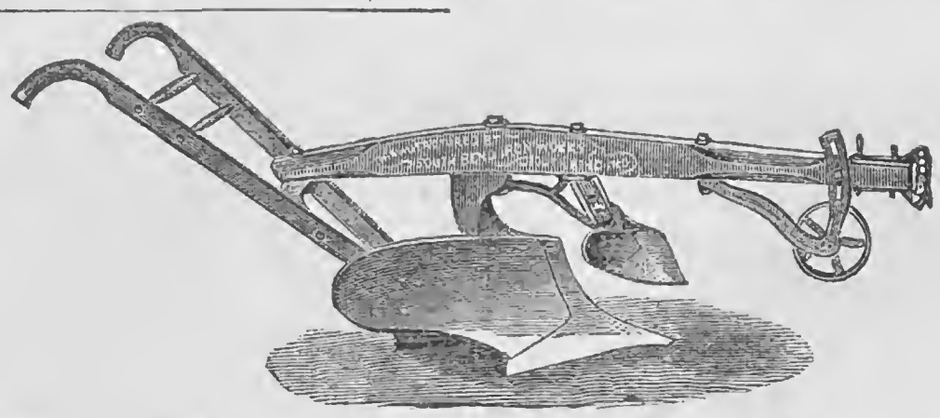
well. We give a No. 1 Farm Fan, sieves 24 inches wide, Price $35, for a club of 60 subscribers. Made by A. P. Dickey, Racine, Wis.

No. 8.—Hoosier Corn Drill.

Of the merits of this drill we can safely speak, having used one on the Rural Experiment Farm during the past season, and we are convinced that no corn-grower can afford to be without at least *one* good corn drill. The drill here shown drops with regularity one grain in a place, and is so arranged that it can be adjusted to deposit them 12, 16 or 20



inches apart, to suit the requirements of various kinds of soils. It also at the same operation does the covering uniformly in depth, and its covering shares can be adjusted to cover deep or shallow. There is economy in its use, from the fact that no thinning is necessary and no replanting either, in case good seed is sown. Price $15. Given for a club of 20 subscribers. Hoosier Drill Co., Richmond, Ind.

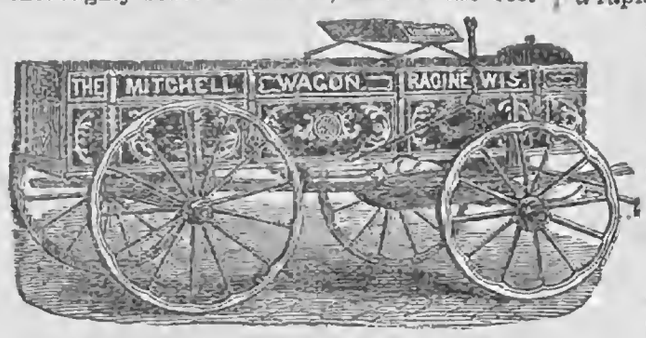


No. 9.—Oliver Chilled Plow,

made by the Oliver Chilled Plow Works, South Bend, Ind. For a general-purpose plow we know of none better adapted to the farmers' use than the plow here offered. It is fully warranted by the above firm, whose reliability is unquestioned. There are now more than half a million of these plows in use and the sales this year will aggregate 85,000. We give Nos. 40 or E1, full-rigged; price $16, for a club of only 32 subscribers, at $2 each.

No. 10.—The Mitchell Farm Wagon.

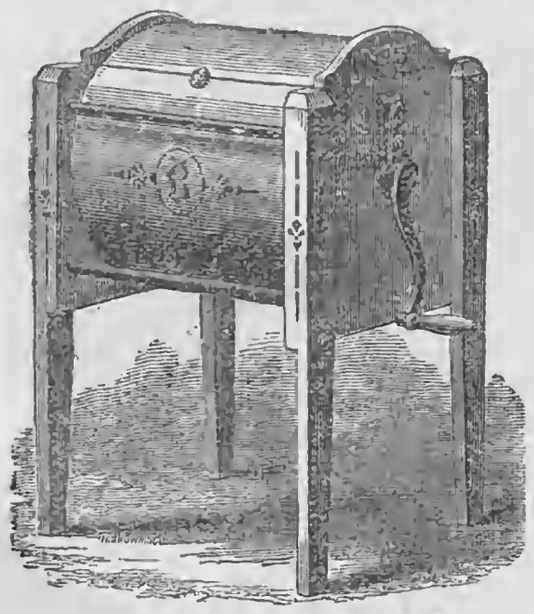
In offering this wagon again this year we hope to please as many of our friends as we did last year. It is certainly a prize worth having, and general satisfaction is expressed by all who have used them. It is made of thoroughly seasoned timber, and of the best



iron and steel. The one we offer has a 3¼x10 inch skein and 1½x9-16 and ⅝ inch tire. It is supplied with steel spring seat, Hurlburt patent brake, top-box, whiffletrees, evener, neck yoke and stay chains; in fact, everything in readiness for service. The price has advanced this year to $110, but we present it for a club of 100 subscribers at $2 each. Made by Mitchell, Lewis & Co., Racine, Wis.

No. 11.—The Blanchard Churn.

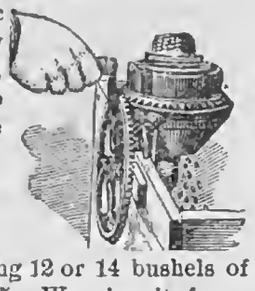
We take great pleasure in offering this churn to our friends. It is classed among the leading



churns of this country, and the manufacturers are among the most reliable. The father and sons have been engaged in making churns for over 50 years, and during that time have become familiar with all the essential points necessary for the construction of a churn such as will meet with the indorsement of the public. This they have accomplished in the new Blanchard, and all who secure a present so useful and reliable as this, cannot help but be delighted with it. We offer *two* sizes. No. 3 (two gallons) for a club of 10, and No. 5 (eight gallons) for a club of 14. Price $6 and $8. Made by Porter Blanchard's Sons, Concord, N. H.

No. 12.—The Right-Speedy Corn-Sheller.

We here offer, at an extremely low rate, a very handy and useful corn-sheller, made by Curtis Goddard, of Alliance, Ohio. It is a new, compact, and effective sheller. It is strongly constructed of metal, and is easily attached to the grain receptacle, be it a barrel, box, or tub, with screws, or by inserting a wedge. Can be used by a man or boy,



and is capable of shelling 12 or 14 bushels of ears per hour. Price $5. We give it for a club of eight subscribers at $2.

No. 13.—The Weed Sewing Machine.

We have used this valuable household article as a premium so many years that it is not necessary for us to dwell upon its superior merits. It is noiseless in its operation, light in running and simple in construction. Of the many machines we have given to our friends as premiums, we have yet to hear of a single complaint. We give the Cabinet style, price $80, for a club of only 50 subscribers at $2. Made by the Weed Sewing Machine Co., Hartford, Conn.

No. 14, 15, 16.—Columbia Bicycle.

Here you have it: a premium that will create a *furore!* Nothing equals it for rapidity and ease of travel. The Bicycle is a peculiar vehicle. Approaches to it had long ago been made in pedimotive and manumotive carriages, and especially in two-wheeled velocipedes. The Bicycle proper has superseded all of them, and stands to-day without a rival as a rapid and easy mode of travel. No horse can compare with it for endurance; no other pastime is half so fascinating, and the exercise is recommended by the medical profession as being the most conducive to health. People have traveled over a common turnpike-road a distance of 100 miles in seven hours, and 1,400 miles in six days.

We offer three styles of this popular vehicle, *all* of which are *fully warranted* by the *Pope Manufacturing Co., Boston, Mass.*

No. 14 is styled the "Special Columbia," half bright, and painted in two colors, the prices range from $117.50 to $132.50, according to size; and we furnish any size desired for 320 subscribers.

No. 15 is styled the "Standard Columbia," half bright, and painted in two colors, prices from $80 to $100, and any size furnished for 240 subscribers.

No. 16 is styled the "Ordinary Columbia," prices from $60 to $75, and we furnish any size desired for 188 subscribers.

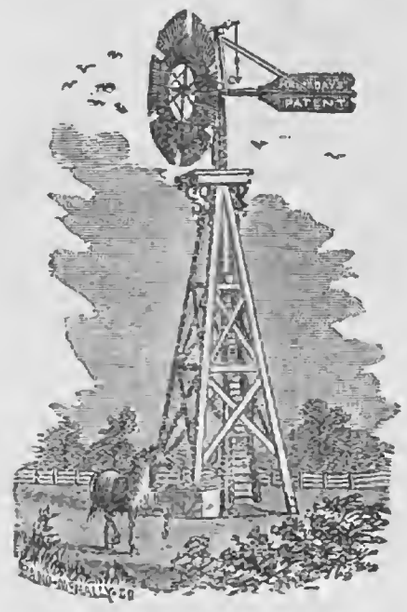
No. 17.—La Dow's Disc Harrow, No. 5,

steel disc; manufactured by The Wheeler & Melick Co., Albany, N. Y. This wheel Harrow is

one of the best and most suitable helps that a farmer can have on his place. We have one of them in use at the Rural Farm, and would not part with it for twice its cost. We offer the above style for a club of 84. Price $35.

No. 18.—Halliday Standard Wind Mill.

Made by the U. S. Wind Engine & Pump Co., Batavia, Ill. The growing popularity and

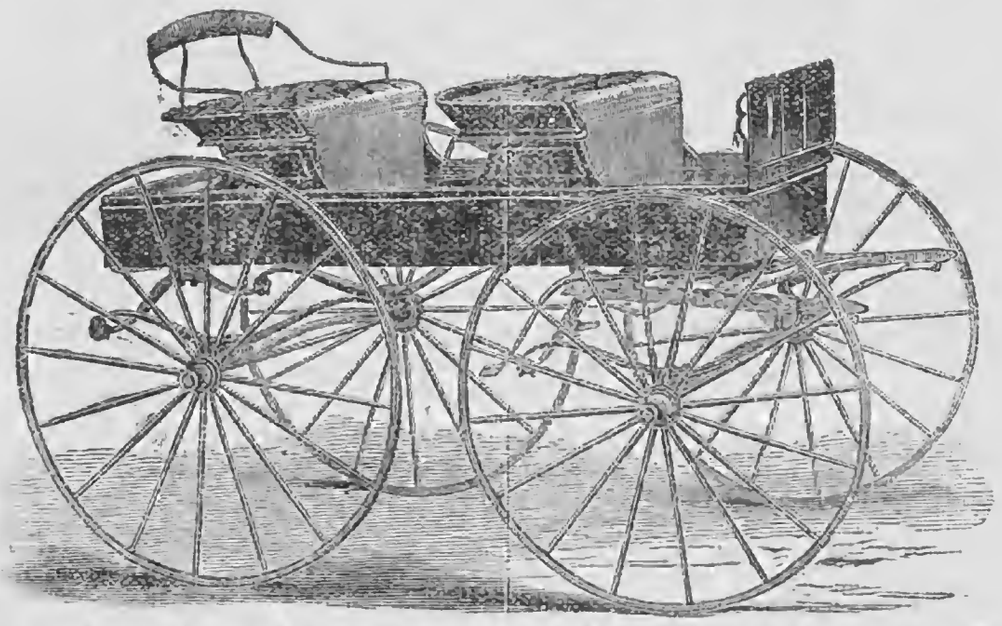


usefulness of wind mills, especially among stock breeders, and their being comparatively inexpensive, with no extra outlay for running them, induce us to offer these mills as premiums. We have chosen the Halliday Standard on account of its many points of excellence and we believe that whoever is fortunate enough to secure one of these premiums will be fully satisfied. We give No. 2, 10 ft. diameter, weight 450 pounds; price $100, for a club of 180 subscribers.

No. 19.—The Philadelphia Broadcast Seed Sower

is made by Benson, Maule & Co., Philadelphia, Pa., and has made for itself a fine record. Its chief merits are an exceptionally large

seed-reservoir, perfect and wide-spread cast, and non-liability to get out of order. The range of its usefulness is noteworthy, it being capable of sowing the largest and smallest seeds. A gauge-plate, handily placed, makes the change instantly for different seeds and quantities. The price is $6, and we give it for a club of 12 subscribers.



No. 20. Mitchell Platform Spring Wagon, with round corner body, seven feet three inches long, nine inches deep, drop end gate. Patent wheels three feet eight inches, and four feet two inches high. Complete, with pole whiffletrees and neck-yoke, two seats with enameled duck cushions, lazy back on back seat. Steps on each side. In order to please a number of our agents who last year made several inquiries about this kind of a wagon, we have arranged with Mitchell, Lewis & Co., Racine, Wisconsin, to supply us with a limited number. Every wagon fully warranted. Price $120. Given for 120 subscribers.

No. 21.—Charter Oak Swivel Plow.

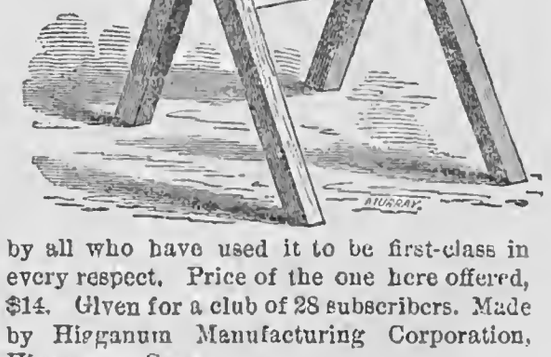
This is one of the best side-hill plows we know of, and will prove a serviceable gift to any one requiring a plow of this kind. It is made by the Higganum Manuf. Corporation, Higganum, Conn. The two-horse plow costs $15, and we give it for a club of 20 subscribers.

No. 22.—Novelty Printing Press.

For a small office, a job office, or a manufacturing establishment, this press is particularly adapted. A young man who is energetic enough to raise a club, can secure this premium which will prove of great value. It can be easily operated, and the profits accruing from job work will very soon pay for it. The regular retail price is $50. We give it for a club of 40 subscribers at $2 each.

No. 23.—Bradley's Self-Dumping Hay Rake.

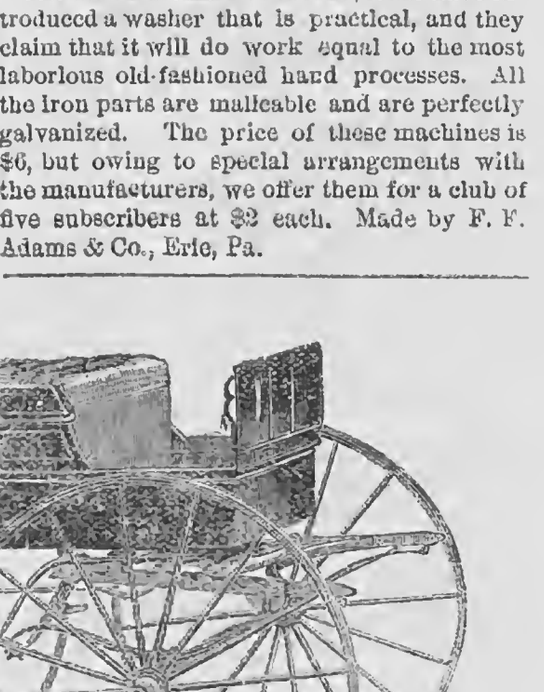
This rake made by Bradley & Co., Syracuse, N. Y., received a grand medal of honor at the



Centennial Exposition. It has many points of excellence, is made of the best material, and fully guaranteed. Price $38. Given for a club of 70 subscribers at $2.

No. 24.—Clark's Root Cutter, No. 2.

Among stock raisers, this is a very popular and valuable implement. It cuts all kinds of roots in shape for feeding, and is pronounced



by all who have used it to be first-class in every respect. Price of the one here offered, $14. Given for a club of 28 subscribers. Made by Higganum Manufacturing Corporation, Higganum, Conn.

No. 25.—The Keystone Washer.

The manufacturers of the Keystone have introduced a washer that is practical, and they claim that it will do work equal to the most laborious old-fashioned hand processes. All the iron parts are malleable and are perfectly galvanized. The price of these machines is $6, but owing to special arrangements with the manufacturers, we offer them for a club of five subscribers at $2 each. Made by F. F. Adams & Co., Erie, Pa.

No. 26. Improved Big Giant Feed Mill,

manufactured by J. A. Field, Son & Co., St. Louis, Mo. This mill is especially adapted for grinding all kinds of grain for home and farm use. It grinds corn and cob together or any

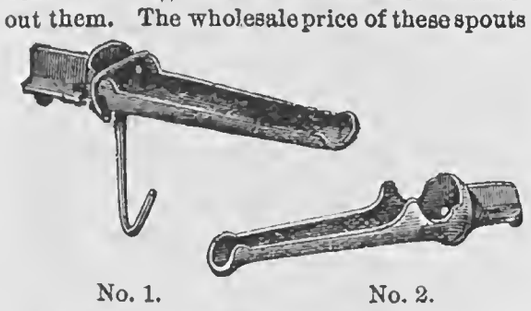
kind of feed coarse or fine. We can recommend this mill highly. No farmer who is engaged in stock raising to any extent should be without a mill of this kind. Price $60. Given for 90 subscribers, at $2 each.

No. 27.—The Planet, Jr., Garden Drill, No. 2.

This drill has a 13-inch wheel and a 7-inch roller. It has a self-cleaning opening plow adjustable in depth by a thumb-nut, and a marker for rows up to 20 inches. It has a capacity of 2½ quarts. The discharge openings all adjust to the same size at once, and admit of the most minute alteration, instead of restricting the operator to a series of holes, none of which may be the size wanted. The covering is done in the most perfect manner by the rims of the carrying wheels upon which the dirt is first thrown by the plow, and from which, as the wheels revolve, it is continually returned exactly on top of the seed with regularity and certainty. S. L. Allen & Co., manufacturers, Philadelphia, Pa. Price $12.00. Given for a club of 24 subscribers.

No. 28.—Post's Eureka Sap Spouts—made by C. C. Post, Burlington, Vt.

These sap spouts are surpassed by no others, and give the utmost satisfaction. They are made from the best quality of iron, and are galvanized. They do not rust or corrode, and will last for generations. They do not injure the tree, and are more quickly adjusted than any others. No sugar maker can afford to do without them. The wholesale price of these spouts



No. 1. No. 2.

is $4.50 per hundred (see cuts No. 1. and 2). It will be observed that No. 1. has a hook for the support of the buckets and No 2. is designed for buckets that have ears to them, which slip over the end of the spout, and are firmly held by the grooves, in the spout. We give 100 of either style of these spouts for a club of 14 subscribers at $2.00 each.

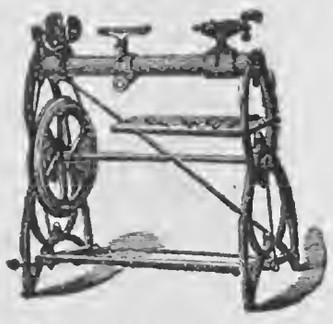
No. 29.—Little Detective Scale.

No. 30.—Union or Family Scale.

These scales are manufactured expressly for us by the Chicago Scale Co., Chicago, Ill. As a measure of economy nothing will pay better than a good, reliable scale. Every farmer should know the weight of his produce before he sells it, and also what he buys. By special arrangements with the above company we are enabled to make a very generous offer on these scales—an offer which will, we think, put them within the reach of every one. Price of No. 29 is $3. and we offer it for eight subscribers. Price of No. 30 is $14. and is given for a club of 20 subscribers.

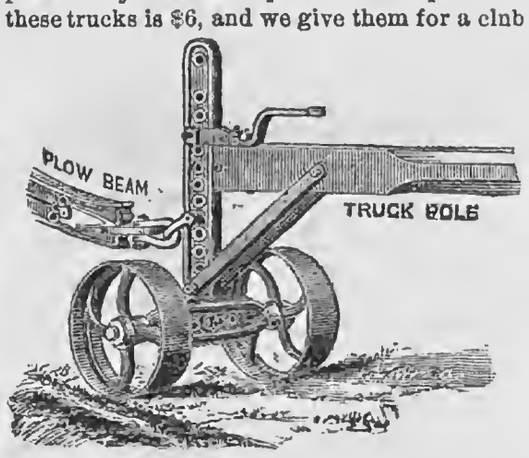
No. 31—Marsh Cylinder Foot Lathe.

This is the most perfect combined machine we have ever seen, and is made in the most finished and workmanlike manner. Its great merit lies in its capacity for doing so many different kinds of work. With this lathe a farmer is in a measure independent of the machinist, and the boys may acquire a familiarity with working in metals and wood, that will be of service to them in any station of life. Price, $52.50. Given for a club of 50 subscribers. Made by The Battle Creek Machine Co., Battle Creek, Mich.



No. 32—Harris's Farm Truck.

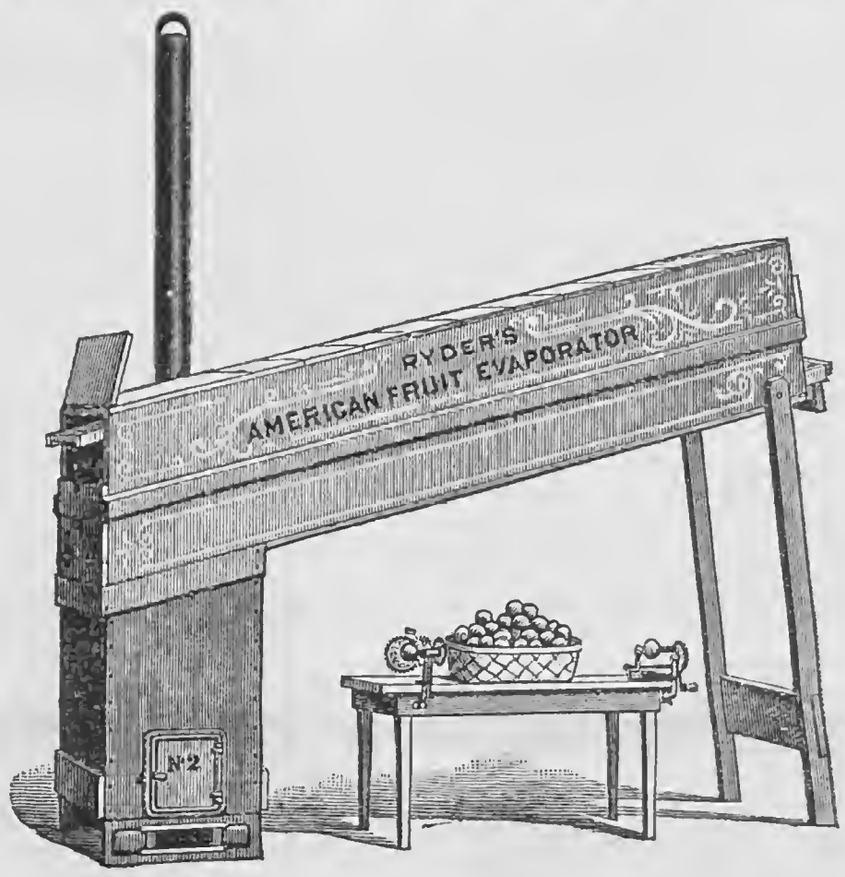
Every farmer who values economy of labor will appreciate the above premium. These trucks have been tested on our Experiment Farm, and for practical and convenient purposes they are unsurpassed. The price of these trucks is $6, and we give them for a club



of 12 subscribers, at $2 each. Made by Saxton & Amidon, Buffalo, N. Y.

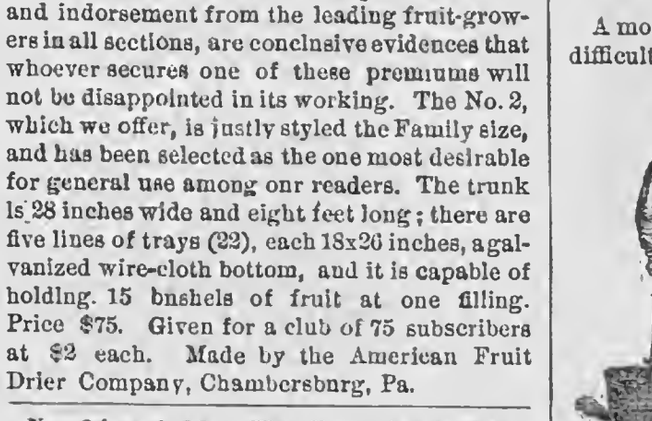
No. 33.—Ryder's American Fruit Drier, or Pneumatic Evaporator.

During the past year our readers from all sections of the country have besieged us with inquiries about Fruit Driers. So numerous have they become, and so popular is the idea of drying fruit by pneumatic processes, that we have decided to use them for one of our premiums. In selecting the above drier we have made choice of one which, from personal inspection, we know to be all that is claimed for it. Its triumphs and first premiums at agricultural societies, its competitive record and indorsement from the leading fruit-growers in all sections, are conclusive evidences that whoever secures one of these premiums will not be disappointed in its working. The No. 2, which we offer, is justly styled the Family size, and has been selected as the one most desirable for general use among our readers. The trunk is 28 inches wide and eight feet long; there are five lines of trays (22), each 18x26 inches, a galvanized wire-cloth bottom, and it is capable of holding. 15 bushels of fruit at one filling. Price $75. Given for a club of 75 subscribers at $2 each. Made by the American Fruit Drier Company, Chambersburg, Pa.



Nos. 34, and 35.—The Pennsylvania Lawn Mower, Manufactured by Lloyd, Supplee & Walton, Philadelphia, Pa.

We offer two sizes. No. 34 has a 14-inch cutter, and an eight-inch wheel. Easily operated by a lady, as the weight is only 36 pounds; Price $20, and we give it for a club of 48 subscribers, at $2. No. 35 has a 16-inch cutter, weighs 38 pounds. Price $22. Given for a club



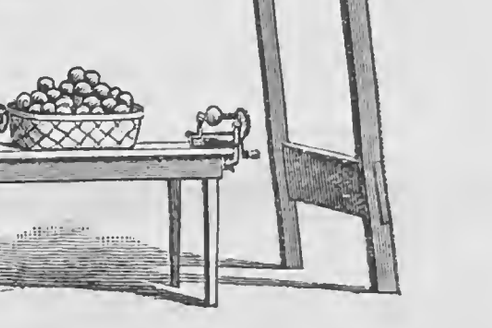
of 53 subscribers. These mowers run very easy, cut longer grass, have no springs to get out of order, and are very durable. Report of Pennsylvania State Agricultural Society says, "it will, we believe, do the work better with less labor than any other mower." The popularity of these machines, and the well-known reliability of the manufacturers, will, doubtless, be sufficient guarantees of their merits, and make them a very popular premium, and one our friends will be much pleased with.

No. 36.—The Kelsey Printing Press.

We know of nothing that will please the young people more than this premium, and we place it within the reach of every one. The bed-plate is 3x5 inches, admitting anything as small as one line of type or as large as a postal card. Metal "rules," inking roller, two boxes of ink, one of lye, etc., go with each press. Price $10. Given for a club of 6 subscribers at $2. Made by Kelsey & Co., Meriden, Conn.

No. 37.—Matthews' Seed Drill.

This is one of the best known garden drills. It will open a furrow, drop seed accurately the desired depth, cover it, lightly roll it, and while performing these operations mark the next row. It sows with an evenness and



rapidity impossible for the most skillful hands to do. It will sow all the varieties of beet, carrot, onion, turnip, parsnip, sage, spinach, sorghum, peas, beans, &c. The drill is complete in all its arrangements, and very durable. Twenty-eight subscribers, at $2.00 each, will obtain one of these drills. Made by Everett & Small, Boston, Mass.

No. 38.—The Aquapult.

A more useful machine than this it would be difficult to find. It can be used as a fire engine,

portable force pump, sprinkler, window washer, bug destroyer, etc. The method of using it is shown by the illustration. It will throw water forcibly against a 3nd-story window or on roofs that do not exceed that hight. It will pay for itself in one season, if used only for sprinkling the garden and lawn, and every one that has not one of these useful machines should set to work at once and secure enough subscribers to entitle him to one. Price $9. Given for a club of 10 subscribers at $3 each. Made by W. & B. Douglas, Middletown, Conn.

No. 39—A Set (2) of the Rural Telephones.

These telephones are made for us by Prof. W. R. Brooks, of Phelps, N. Y. They are considered reliable, durable and perfect instruments for conveying the human voice over lines varying from 50 to 5,000 feet. We give two sizes. A set (two telephones) of size A. will be given for a club of five subscribers. A set of size B. for a club of eight subscribers. Use size A. for short distances and size B. for long distances.

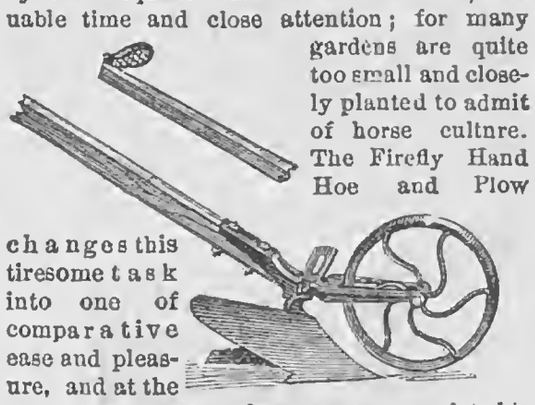
No. 40.—The Winger Oscillating Farm Mill.

This small grist mill is an attachment for windmills. Where one possesses a windmill or horse power this can be used to great advantage. The smaller ones can be run by hand and are extremely economical. It is

claimed to have improvements, such as having the grinding wheel in the center, making four instead of two grinding surfaces. The wheel and case are chilled cast-iron. It can be taken apart without trouble. Its price is $20, and it is made by the Stover Wind Engine Co., Freeport, Ill. Given for a club of 32 subscribers.

No. 41.—Allen's Firefly Hand Hoe.

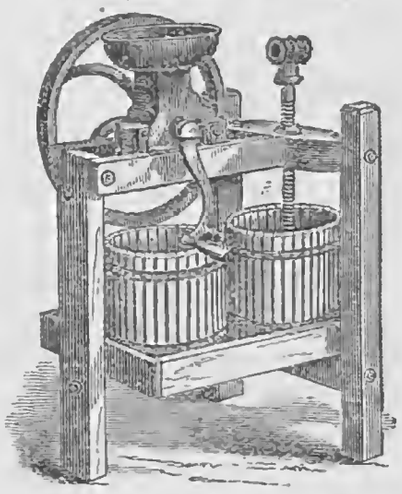
A garden that is well kept, is kept so only by the frequent bestowal of hard labor, valuable time and close attention; for many gardens are quite too small and closely planted to admit of horse culture. The Firefly Hand Hoe and Plow



changes this tiresome task into one of comparative ease and pleasure, and at the same time enables the user to complete his work far better and in one-sixth of the usual time. The furrows for beans, corn, peas and potatoes can be opened by it, and afterwards covered neatly. Price $4.00. Given for a club of seven. S. L. Allen & Co., Philadelphia, Pa.

No. 42.—Farmer's Favorite Cider Mill, No. 1.

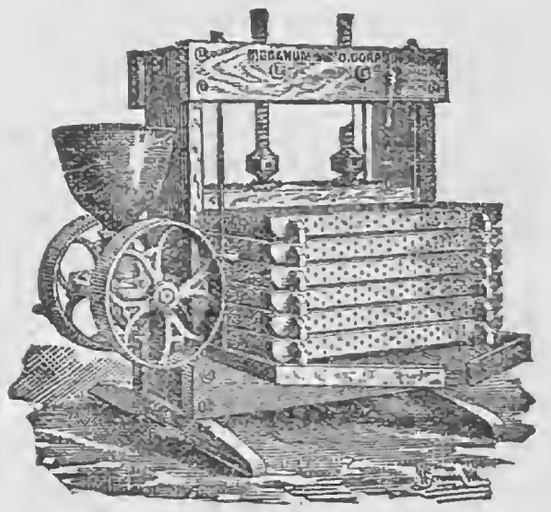
The cut represents the *family mill*, which has now been on the market for five years past, and is pronounced to be the best, simplest and most perfect mill built. The grinding apparatus is so made that it does not slice and cut the fruit, and leave it in hard lumps,



but thoroughly crushes and grates it, so that every cell is broken and a fine pomace produced. Can be taken apart in two minutes, and thoroughly cleaned and replaced without any trouble, and is capable of grinding ten bushels of apples per hour. Price $22. Given for a club of 44 subscribers. Manufactured by Higganum Manufacturing Corporation, Higganum, Conn.

No 43.—Farmer's Favorite Mill and Press Combined,

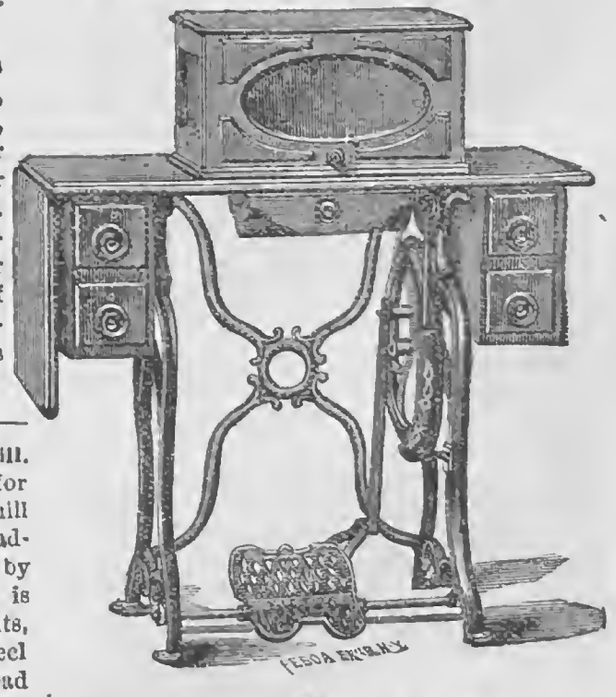
made by the same manufacturers, and designed to be run by hand or power, as per



above cut; will be given for a club of 125 subscribers. Price $75. Made by Higganum Manufacturing Corporation, Higganum, Conn.

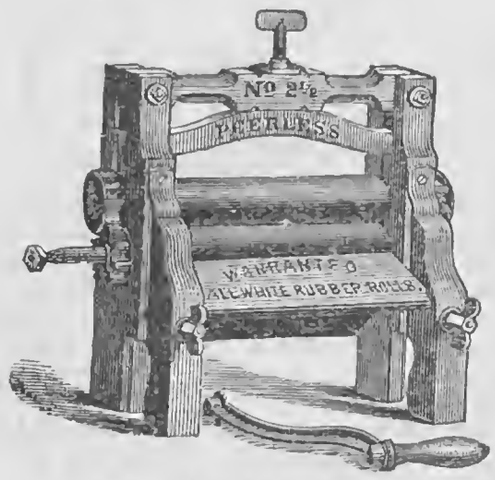
No. 44.—The Victor Sewing Machine.

The style here shown is the same machine



that once sold for $55. Having purchased a quantity of them, we purpose to put them at a price within the reach of every family who are in need of this valuable household

article. Ladies especially will be greatly interested in this extremely low offer, many of whom can secure enough subscribers among their immediate friends to secure a lock-stitch, shuttle sewing machine. We will send it to any person who will furnish us with 20 subscribers, at $2. The retail price now is $37.50. This is equivalent to our paying $1.87½ for each subscription, and can only be offered at this very low rate from the fact of our having purchased a quantity of them at one time. Made by the Victor Sewing Machine Co., Middletown, Conn.



No. 45.—The Peerless Clothes Wringer.

Who can afford to do without a clothes wringer, when one can be obtained so easily? Any competent person, male or female, can secure one of these labor-saving machines by one day's canvassing for the RURAL NEW-YORKER. We have selected size No. 2, believing it to be best adapted to general family use. Its finish is perfect; it has a strong frame, white rubber rolls, metal journals, patent crank and tub fastenings, and everything to make it a first-class wringer in every respect. It is made and sold by the Pecriess Wringer Co., of Cincinnati, and costs $8. We give it for a club of six subscribers, at $2 each.

A Family Premium,

No. 46.—Charter Oak Stove has an Oven 19 x 20 inches, with full set of trimmings as follows, 1 Wash Boiler, 1 Coffee Boiler, 1 Steamer and Cover, 1 Pot Cover, 1 Iron or Tin Tea Kettle, 1 set (4) Bake Pans, 1 Joint Pipe, 1 Pot, 1 Kettle, 2 Skillets or Spiders, 1 Iron Heater, 2 Cake Griddles. Packed and delivered free of charge on board any steamboat, or at any depot in St. Louis. The above stove can be used with either Hard or Soft Coal. When a stove is preferred to be used with wood only, a corresponding size will be sent trimmed as above. An illustrated circular giving full description of these celebrated stoves will be sent to any one who applies to the manufacturers Made by the Excelsior Man'f. Co., St. Louis, Mo. Price $35. Given for 44 subscribers.

No. 47.—Hand Drill, No. 4.

A drill stock eight inches in length, and weighing eight ounces. It is made of iron with rosewood handle, and brass chuck for holding the drill points. This chuck is made on a new plan and it centers and holds the drill perfectly. With each drill stock we send a box containing six superior drill points of various sizes. A more serviceable tool for the farm or workshop could not be given. Price of stock and drills 50 cents. We send it for a club of two subscribers at $2 each.

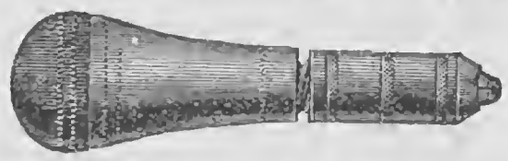
HAND DRILL. NEW ROGERS SAW.

No. 48.—The New Rogers Saw

This saw, with all the improvements that ingenuity can suggest, is without doubt one of the most complete and best saws made for the price asked. The entire framework is made of iron, painted and japanned black, and ornamented with red and gilt stripes. The arbors, etc., are made of steel, and are all carefully gauged and fitted to their bearings. The arms and pitmans are of the best selected *ash*. All parts made to interchange. In fact it is made throughout to *last* and to give entire satisfaction. We have used many of them for premiums, and they have given universal satisfaction. Price $4. Given for a club of 10 subscribers.

No. 49.—Patent Adjustable Tool Holder.

These tool holders have stood the test of many years, and are fully warranted. The handles are hollow with twenty cast-steel tools,



hard maple handle, with lignumvitæ leap, and adjustable steel chuck. Will hold anything from a cambric needle to 8-inch mill file. Price $1. Given for a club of 3 subscribers.

No. 50.—Family Grind-Stone.

So far as we know this is the first foot-power machine that is fully adapted to the wants of families for household work, or of mechanics for grinding small tools. The stone is of the best quality, and runs perfectly true. The emery wheel is the same size as the stone, and double-coated on the side and rim with best Wellington Mills emery, and can be taken off when not in use. For grinding carving-knives and all light tools and for polishing cutlery this machine is perfect. Price, including box, $4. Given for a club of eight subscribers. Premiums 65—71 are made and supplied to us by the Miller's Falls Co., 74 Chambers St., N. Y.

No. 51. Palace Organ.

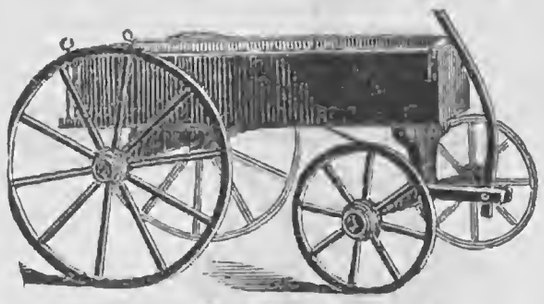
The Loring & Blake Organ Co., Worcester, Mass, supply us with this organ. In selecting a suitable instrument of this class to offer as a present, we were guided by the advice of musical friends, and the style we give is thought to be exactly suited to the requirements of the country home. The cut below shows the style of the case which is comparatively plain in appearance, which is a positive advantage

from a musical point of view, as the light, resonant case secures a peculiarly sympathetic quality of tone that is the perfection of accompaniment for solo singing. This organ is furnished with three sets of reeds—one of twenty-eight notes and two of thirty-three notes each. The power is sufficient to fill any ordinary room completely and it will lead a fair-sized chorus without difficulty. The five stops—diapason, melodia, vox celeste, tremelo, and forte, with the patent knee swell, produce a fine combination of musical effects. Price $180. Given for a club of 150 subscribers at $2.00 each.

No. 52—The Tally-Ho Perambulator with a Valise Top.

The above cut represents the style of carriage here offered. It is well made, handsomely finished, and durable in all its parts The attractive feature is the valise top which

is constructed in such a manner that it can be moved backward and forward, thereby shielding the child from the sun's rays without obstructing the air; or it may be opened and as if by magic, curtains are revealed ready to be drawn down for protection from cold or dampness. This is a vast improvement upon the old style of perambulators and should be received with exceeding joy. Ladies could not better employ their time than in soliciting the needed number of subscriptions to obtain it. Price $10. Given for a club of 24 subscribers.



No. 53.—Boys' Express Wagon.

This is constructed with iron axles and heavy welded tire wheels. It is 16x33 inch body, has good-sized wheels and the front ones turn under the box; is well made throughout which of course, combines strength. The possession of one of these satisfies many a boy's ambition. It is a toy which is both useful and amusing. Price $5. Given for a club of 12 subscribers.

No. 54.—Velocipede. This is suitable for boys from the ages of 6 to 9. Its front wheel is 22 inches and has an iron hub; the wheels are oval tired and the handles tipped. It is upholstered with a finely-stitched leather saddle, with wood parts painted and ornamented. Exert yourself to obtain the needed number of subscriptions and make some child happy in its possession. Price $6. Given for 14 subscribers.

No. 55.—Bicycle. This is an excellent gift to the young readers of the RURAL. Beauty and strength have both been considered and

combined in its construction. It has a 36-inch front wheel; is a suitable size for boys or young men from 13 to 18 years. What boy would not canvass the country for subscriptions when such a prize is awaiting the fruits of his labor? Price $15. Given for a club of 36 subscribers.

All these premiums from number 52—55 inclusive are from the well-known establishment of C. W. F. Dare, No. 47 Cortlandt St., New York. There have been no pains spared to make them perfect and they are fully warranted.

No. 56.—ONE DOZEN CELLULOID-HANDLE TABLE KNIVES. Price $10.25. For a Club of 18.

No. 57.—ONE DOZEN CELLULOID-HANDLE DESSERT KNIVES. Price $9.25. For a Club of 17.

No. 58.—ONE DOZEN HARD RUBBER-HANDLE TABLE KNIVES. Price $8.75. For a Club of 14.

No. 59.—ONE DOZEN HARD RUBBER HANDLE DESSERT KNIVES. Price $8.25. For a Club of 13.

No. 60.—ONE CARVER, FORK AND STEEL CELLULOID-HANDLES AND PATENT REST. For a Club of 11.

No. 61.—ONE CARVER, FORK AND STEEL, HARD RUBBER-HANDLES AND PATENT REST. For a Club of 8.

No. 62.—Child's Set in Case, consisting of knife, fork and spoon—all heavily plated and very handsome. Price $3. Given for a club of six.

No. 63.—Same as above on card instead of case, and with a lighter plating. Price $1.50. Will be given for a club of three subscribers.

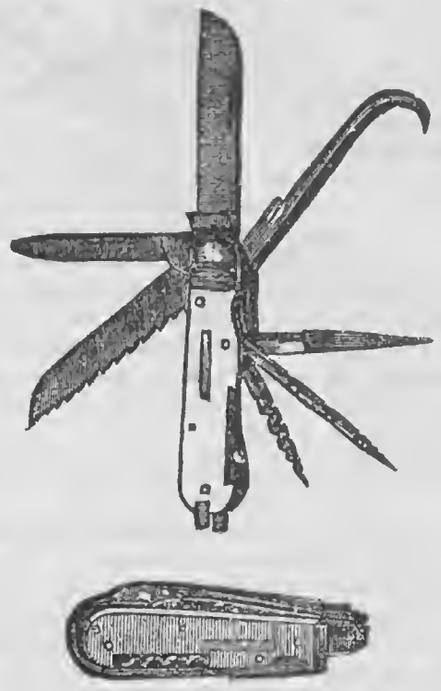
No. 64.—A very nice nut-pick. Price 75c. Given for two subscribers at $2 each.

All of this very excellent cutlery (including No. 65) has been selected for us by the Meriden Cutlery Co., and represents the cream of their manufacture in this particular class of goods. Their reputation is not confined to this country alone, and the articles are perfect in every respect. The Celluloid is a substance that resembles, and is an improvement upon ivory, as it does not turn yellow with age, and is nearly indestructible.

The Hard Rubber makes an excellent handle, as it is impervious to heat, and will bear the hardest usage, with the least appearance of wear.

No. 65.—Multum-in-Parvo Pocket-Knife.

Nothing in the way of knives combines as many conveniences as the one shown in the illustration. Open, it is a magazine of tools; shut, it is as compact and as neat in appearance as could be desired. As its name suggests, it is much in little. The engraving shows the parts of the knife, except the very effective screw-driver hidden by the opened large blade. The Saw is double-toothed, and will cut an inch board, saw off a good-sized stick, cut a notch, etc. The Hook is used to lift a stove-cover, pry open sundry things, clean a horse's



hoof, etc. The Punch makes holes in harness, wood, etc., which can be enlarged by its sharp corners. The Gimlet and Corkscrew are convenient, of course. The Tweezers and long Pointer, or Brad-awl, drawn from the end of the handle, often come into use. The back of the Hook makes a good Hammer for tacks, and small pounding. The inside of the Hook forms a small Nut-cracker. All inclosed in a compact white handle, the whole weighing only two ounces. Given for a club of 8.

No. 66.—One Dozen Silver-plated Medium Forks. [Price $10.] For a club of 16.

No. 67.—One Dozen Silver-Plated Table Spoons. [Price $10.] For a club of 16.

No. 68.—One Dozen Silver-Plated Tea Spoons. [Price $6.] For a club of 8.

No. 69.—Silver-Plated Fruit Knife. For a club of 5.

The forks and spoons offered above are especially commendable for beauty of design, (the style illustrated, named the "Niagara," is one of the most recent patterns), and the thorough and *honest* manner in which they are made. Electro-plating, like charity, can be made to cloak any amount of fraud, and it is only in the *reputation* of the manufacturer that the purchaser has any guarrantee that the article is as represented.

The process of electro-plating with silver is quite simple. The articles to be coated with the film are placed in a "bath," which is composed of double cynadide of silver and potassium, held in a wooden vat. The articles are hung by copper wires from brass rods, and then the connection is made with the battery, and after about an hour the process is completed. Almost any kind of metal may be thus coated; hence it may be seen that the worth of the goods depends entirely on the honesty of their maker. We have always been extremely careful to select our silver-ware premiums from those only whose reputation is unblemished, and we have had our reward in the satisfaction expressed by our friends.

No article of this character receives such constant hard usage as forks and spoons, therefore it is of the first importance that the metal *underneath* the silver coating should be thoroughly adapted to its use. These articles are from the well-known house of Hall, Elton & Co., Wallingford, Conn., whose forty years of experience are a substantial guarrantee of manufacturing the quality of the premiums above offered.

No. 70.—Silver-Plated Service of six pieces, comprising Tea, Coffee and Hot-Water Urns, Cream Pitcher, Sugar and Slop Bowls. Price $48. For a club of 48.

No. 71.—Tete-a-Tete Service of four pieces. Price $23. For a club of 23.

No. 72.—Ice-Pitcher Price $14. For a club of 13.

No. 73.—Cake Basket. Price $9. For a club of 5.

No. 74.—Pickle Castor. Price $5. For a club of 5.

No. 75.—Butter Dish. Price $6. For a club of 6.

No. 76.—A Set (2) of Flower Vases. Price $8. For a club of 8.

No. 77—Drinking Cup. Price $4. For a club of 5.

No. 78.—A half-dozen Napkin Rings. Price $4. For a club of 5.

This silver plated ware is also from the factories of Hall, Elton & Co. [See Nos. 66 to 78.] The designs are unique and strikingly handsome — the tete-a-tete set notably so. The pickle castor contains two fine cut-glass cruets (large) and a pickle fork. The stand is very ornate. The flower vases are painted on a tinted porcelain surface. The subjects are artistically treated and the effect is imposing. In short, the entire selection is one of the finest we have ever offered as premiums, and the articles are given for very small clubs in proportion to the value of the premiums. As serviceable presents nothing can be nicer than this ware.

No. 79.—Gentleman's Stem-Winding Gold Hunting case Watch.

No. 80—Same watch as above, with key winding attachment.

No. 81.—Lady's Gold Hunting-Case, Stem-Winder.

No. 82.—Same as above, with key winding attachment

These watches are of the celebrated Borel & Courvoisier make and are supplied direct to us by their agents in New York, Messrs. Quinche and Krugler. We cannot speak too highly of these watches, as they are among the best imported. We have used them for years as premiums and have received many congratulatory letters concerning them. They are full-jeweled, highly finished, and are inclosed in splendidly engraved gold hunting-cases. They were awarded the highest honors at the Centennial for extreme accuracy and perfect workmanship.

No. 79 costs in New York $150 and we give it for 150 subscribers.

No. 80 costs $100, and we give it for 100 subscribers.

No. 81. costs $90, and is given for a club of 90 subscribers.

No. 82 cost $75, and is given for a club of 75.

No. 83.—Silver Hunting-Case Watches.

The works of these watches are made expressly for us by the Hampden Watch Co. of Springfield, Mass., whose reputation for

making accurate time-keepers is thoroughly established. The works are set in coin silver cases, of our own selection. Price $23, given for 25 subscribers at $2 each.

No. 84.—The Monitor Clock.

At last we have secured the *gem* of all clocks. There is but one that is good enough to be related to it, and we have captured that also. [See No. 85 "The Traveler."] Our illustration is about a quarter of the size of the clock. The Monitor is an accurate time-piece, and an alarm and a daily calendar in addition. The *white* dial is 3¾ in. in diameter; the clock is wound, set and regulated at the back, and the admirable "movement" is inclosed in a seamless copper case, that is stamped out and heavily nickel-plated. The elegance of the design speaks for itself. A club of 7 secures the "Monitor."

No. 85.—The Traveler.

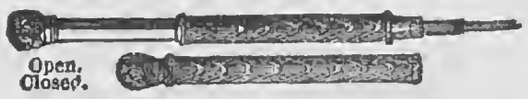
This is a new and elegantly designed clock, with nickel front and back, and the sides of glass, which shows the inside workings of the clock. It has an alarm, and is nicely fitted in a paste-board box. It can be carried in a satchel, when traveling, with no danger of disarrangement. It is also a very nice clock for the house. We present it for a club of 10 subscribers.

The above premiums, Nos. 84 and 85, are made and supplied to us by the Waterbury Clock Company, New York, and the RURAL is the sole paper that can use them as premiums.

No. 86.—Revolving Magic Pencil.

Price $1.50, and given for a club of three subscribers.

No. 87.—Telescopic Pencil.

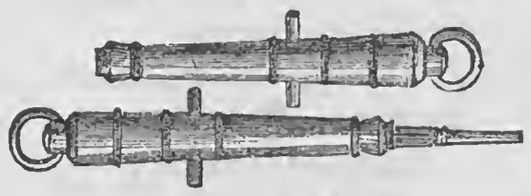


Heavy Rolled plate. Price $5.50. Given for 10 subscribers.

No. 88.—Magic Charm, with Pencil.

Price $1.25. Given for a club of three subscribers.

No. 89.—Cannon Charm for Watch-chains.



Contains Pencil. Price $1.25. A club of three subscribers will obtain one.

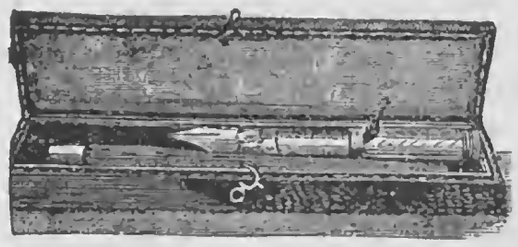
No. 90.—Telescopic Pen and Pencil.

Ebony and gold. Very fine. Price $2 50. Given for a club of five subscribers.

No. 91.—Gold Plate Magic Screw and Pencil.

A very handsome and useful charm. Price $1,25. Given for a club of three subscribers.

No. 92.—Slide Desk, Gold Pen, Ebony and Gold Holder,



With pen to suit the receiver. Price $2.50. Given for a club of five subscribers.

Nos. 86—92 are supplied to us by Messrs. Ludden & Dow, 193 Broadway, New York.

Albums.

For a holiday gift, or for one's own home, nothing is more desirable than a nice album. In making our selection, we have arranged with Messrs. Koch, Sons & Co., No. 156 William St., New York, to furnish us with these goods. This is an old and well established house whose immense variety has enabled us to get handsome and yet low-priced goods, from the very latest patterns and designs; and any one herein offered cannot fail to please. We offer five varieties.

No. 93 is one of the handsomest albums made. Calf-bound with an elegant design of Forget-me-not, on cover; embroidered satin, *scented*, round wire clasp; holds 20 cabinets, and 80 cards, size 8½x10¾. Price $20. Given for a club of 28 subscribers at $2 each.

No. 94 is also bound in calf, with a design of roses on outside, embroidered in satin, *scented*, round wire clasp, and holds 20 cabs. and 40 cards, size 7x9. Price $12. Given for a club of 18 subscribers at $2 each.

No. 95 Turkey Morocco, embossed gilt or silver, round wire clasp, holds 96 cards, two patterns, size 6½x8¾. Price $8. Given for a club of 11 subscribers at $2 each.

No. 96. Imperial ebony, Japanese design, fancy border, round wire clasp, 48 pictures. Size 5¼x6¼. Price $5.00. Given for a club of eight subscribers at $2 each.

No. 100. No. 99. No. 97.

No. 97.—Gent's Double Curb Chain.

Rolled plate; solid gold tips. Price $8. Given for a club of 16 subscribers.

No. 98.—Same as 97,

only lighter in weight. Price $6.50. Given for a club of 12 subscribers.

No. 99.—Lady's Gold Guard.

Rolled plate front, slide and tip. Price $10. Given for a club of 22 subscribers.

No. 100.—Lady's Guard.

Same as above, only heavier. Price $16. Given for a club of 34 subscribers.

No. 101—Is an Elegant Cameo Ring,

suitable for lady or gentleman. Price $5. Given for a club of 10 subscribers, at $3 each.

No. 102—Cameo and Pearl Ring

Latest design, very handsome. Price $6, given for a club of 12 subscribers.

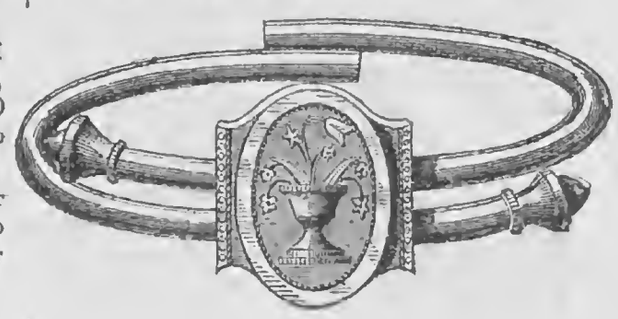
No. 103.—Gent's Intaglio Seal Ring,

an entirely new and beautiful design. Price $12. Given for 24 subscribers.

No. 104.—Lady's Ring.

Two full pearls and ruby. Price $15. Given for a club of 30 subscribers.

No. 105—A Pair of Bangle Adjustable Bracelets.



New and novel. Price $15. Given for a club of 30 subscribers.

No. 106.—Enameled Bracelets,

Price $8. Given for a club of 16 subscribers.

In the selection of this class of goods we have been particularly careful, and have only chosen those articles that are new and useful. For a holiday present nothing is more beautiful than *good* jewelry, and our friends will find nothing here offered that is not true to the description given, and hence need have no hesitancy in making their selections. The stock is from Henry C. Haskell, 13 John Street, New York.

When ordering rings, send a ring of wire of the size required, or a piece of cardboard with a hole cut in it the size of finger, will do. The cuts show the styles, and the prices here given are the retail prices in New York, and Nos. 101—104 are sent free of postage.

No. 107.—Webster's Unabridged Dictionary,

1,928 pages; 3,000 engravings. It also contains a supplement of over 4,600 new words and meanings, and a new Biographical Dictionary of over 9,700 names. Published by G. and C. Merriam, Springfield, Mass. Price $12. We present this magnificent book for a club of 32 subscribers.

No. 108. To those who would prefer a smaller book, we will give the National Pictorial. Octavo. By the same publishers, price $5, for a club of 14 subscribers at $2.

☞SPECIAL NOTICE.☜

WE present below a choice selection of books from the Publishing House of Lee & Shepard, Boston, Mass. Selections of merit from the best Authors on Poetry and Fiction, and the latest publications from miscellaneous writers. Count each subscriber as equal to 50 cents. For example: if you have a club of 20 subscribers, counting 50 cents for each subscriber, it will entitle you to $10 worth of books at the prices named. Postage is extra and must accompany each order.

No. 109. Shakespeare's Works, complete in one volume. Price $1.50, and 14 cents extra for postage.

No. 110. DICKENS'S COMPLETE WORKS.—Household edition, in a new style, 15 vols. Cloth. Price $1 per volume. [Postage 13 cents per vol. extra].

No. 111. CRUDENS' COMPLETE CONCORDANCE OF THE HOLY SCRIPTURES.—Edited by Jno. Eadie, D. D., LL.D. 8vo. Price $1.50. [Send 25 cents for postage.] This is a work adapted to the family Scriptural Reference.

No. 112. HOYLE'S GAMES.—Contain the methods of playing the latest and most fashionable games. Improved Edition. Price $1.00. [8 cents extra postage.]

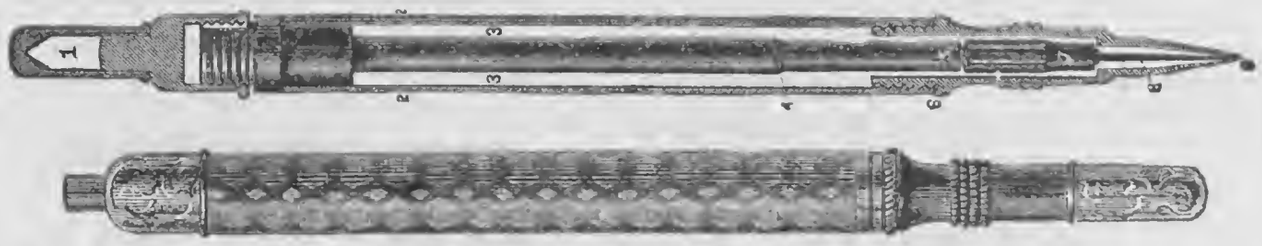
No. 113. KERR (ORPHEUS C.)—Versatilities, Poems, Patriotic, Sentimental and Humorous. 16mo. Price $1.50. Excellent for recitations. [Send 8 cents for postage.]

No. 114. POPULAR RED LINE POETS.—Standard Works. Printed with *Red Line* border. Handsomely bound in cloth, with illustrations by John Gilbert, Birket Foster, E. M. Corbould, J. Wolf and others. Per vol. $1.50.

These are the best boys' books published. Mr. Towle is famous for his treatment of these subjects. They will be found intensely interesting. [Send 9 cents postage for each volume.]

No. 115. YOUNG AMERICA ABROAD SERIES.—A Library of Travel and Adventure in Foreign Lands. 16mo. Illustrated by Nast, Stevens, Perkins and others. Per volume $1.50.

This is one of the best series for boys and girls, combining instruction and amusement in the happiest manner. [Remit 9 cents postage for each volume.] In addition, we will supply other books from Lee & Shepard's list. Apply for a list from which you may select and we will endeavor to fill the order on your application.



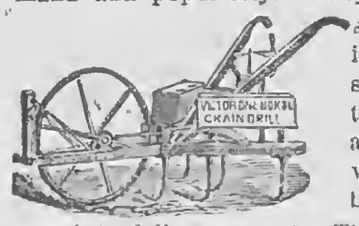
No. 116.—The Mackinnon (Reservoir) Pen.

D. Mackinnon & Co., 200 Broadway, New York, makers. For a pen always ready for use this has no equal. It will write 75 pages of foolscap with one filling and does away with the use of ink-bottles, and the annoyance of dipping the pen in ink, as is the case with an ordinary gold or steel pen. The point is made of iridium, and is guaranteed by the manufacturers to last three years. It may be carried in the pocket without any danger of breaking, as it is furnished in a gutta-percha case and gold-mounted chased tops. Price $5.00. We will present it for a club of six subscribers.

SPECIAL PREMIUM NO. 117.

Victor Five-hoed, One-Horse Drill. Made by Ewald Over, Indianapolis, Ind.

These drills are rapidly increasing in demand and popularity. They are used for



sowing wheat into and between standing corn in the Fall, as well as for sowing wheat, rye, oats, barley, rice, peas, etc., into fallow ground. They are strong, simple in construction, of light draught, and can be expanded and contracted for five different widths, varying from 6½ to 8½ inches from center to center of tooth. It has a splendid Force Feed, and sows more than half as much as a two-horse drill. Price $25. Given for a club of 68 subscribers.

THE

Rural New-Yorker's

REMARKABLE

CLUBBING COMBINATIONS

For 1880-81

Read Them.

To Him that Enjoys Good Reading.

Greeting and Congenial Salutations from the Detroit Free Press.

From the unlimited words of praise that have been bestowed upon it, the conclusion is fixed that

The Detroit Free Press

Is the Most Popular Journal in Existence. Not that it has the greatest circulation—though for that matter few papers have a more extended one—but that the most profound affection for it exists among those who read and know its merits.

Certain it is that no Journal contains so many attractive and original features.

Enjoyable in the highest degree, its tone is the purest, its literary standard the most excellent.

It combines to a surprising extent in its well-filled pages the grace, learning, wit, humor, versatility and genius of the American people.

Unique among newspapers, sprightly and readable in every portion—it is edited with so much tact, intelligence and care, that readers of every class find it above all others the one that satisfies!

Varied are its departments and its contents—the whole a most judicious combination. If one may liken intellectual to material things its field of

Story, Poetry, Correspondence, Anecdote, Wit, Humor, Sentiment, History, Belles Lettres.

knowledge in all its illimitable extent—may be compared to a well-ordered banquet. And around this superb feast in all its completeness bounteously laid with contributions from every clime, sits the blessed spirit of fraternity and good fellowship!

And then "The Household," the bright, sympathetic and kindly "Household!" No description should be offered of "The Household;" it is a feature original and unsurpassed, and none can fail to appreciate it.

The Weekly Free Press and "The Household" together are furnished at $2 a year.

We should be pleased to have all present subscribers renew, and would esteem it as an exceeding favor to have their influence in procuring us new subscribers from among their friends. Address

A WESTERN NEWSPAPER

OF THE FIRST CLASS.

THE

GLOBE-DEMOCRAT

ST. LOUIS,

acknowledged to be the leading newspaper west of the Mississippi River, and equal to any of the great dailies of the Middle and Northwestern States. It has a large and general circulation throughout the West, South and Southwest, its daily edition selling rapidly in all the cities and towns in the sections named by newsdealers. DAILY, $12 per annum, post-paid.

THE WEEKLY GLOBE-DEMOCRAT has an immense circulation among the farmers, fruit-growers, stock-raisers, dealers in horses, cattle, hogs, etc., etc. In fact, its columns of well-selected matter are indispensable to all the industries of all the great and growing interests of the great central and western districts of the United States. It is sought after by the emigrants pouring across the Mississippi River as a guide to them of the promised land they are seeking. Its columns are constantly devoted to well-written letters and articles, truthfully pointing out favored localities for settlements and giving truthful descriptions of the States and Territories west of the Great River. It has an extensive circulation in many of the Northern and Eastern States, principally among persons contemplating emigration to the West, who subscribe for the GLOBE-DEMOCRAT prior to their starting to read up all about the country they think of going to. The GLOBE-DEMOCRAT publishes more news calculated to interest the farmer, mechanic, fruit-grower, stock-raiser, stock-dealer, and in fact, the general reader, than almost any newspaper you can pick up. It is the great newspaper of the West, and has had that reputation ever since the war. It is a sound, aggressive and consistent Republican paper in politics.

Literary Miscellany.

TO THE FAIR.

ANNIE L. JACK.

WHY, where are you going to now,
With William, and Robert, and Jim,
With wife and baby all dressed in their best
And old Dobbin in holiday trim?

You never need ask, neighbor Plod,
You surely must be well aware
That this is the farmer's gala day,
We are off to the county fair.

To the fair! Well, some folks can play
While others are forced to work;
I have some late oats to harvest yet
And cannot afford to shirk.

True, your life *is* hard, neighbor Plod,
Since the boys have all gone away;
Had Tom stayed at home when the oats were sown,
They'd have *been in* the barn to-day.

'Tis a pity for boys and girls
When the city's alluring din,
Can charm them away from the dear old home
For the gold they are hoping to win.

There's health, peace, and wealth, on the farm,
And with ours no life can compare;
But young folks and old need holiday whiles
So you see we are off—to the fair.

INMATES OF LESTER HALL.

CHAPTER I.

"BARTON, have you seen Miss Cecil?"

"Yes ma'am."

"Where is she?"

"Somewhere between this and the village, ma'am. She came into the stable half an hour ago to have the mare saddled, and off she went. Took the fence like a bird, Miss Mattie!" the speaker went on, excitedly. "My word, but she is one to ride, is Miss Cecil!"

And the old servant returned to his gardening with a shake of his head, muttering to himself as he trimmed the bed of geraniums on which he was employed, the gleam of excitement dying out of his kindly old eyes.

"Is she alone, Barton, or is my brother with her?" said Miss Lester, shading her eyes from the sunshine, as she stood on the broad stone steps leading up to the heavily-studded hall-door of Lester Hall, a mansion which at one time had been one of the finest, but which now was fast falling into ruin for want of means to repair the inroads of time.

"Miss Cecil is alone, ma'am," answered Barton, raising his head again and touching his old straw hat respectfully. He had been in the family since his childhood, had known the last head in his days of prosperity and reckless prodigality, and he had not merely a proper but an exaggerated idea of what was due to them. "The young master has gone away over the meadows afoot."

FIG. 297.

Miss Lester's beautiful face clouded slightly as she turned into the house again, leaving the bright sunshine and sweet fresh air, and going into the shade and gloom of the grand old entrance-hall, which was the favorite sitting-room of the present representative of the Lester family—a family which had passed its zenith of prosperty over a century ago, and had been going steadily down hill ever since, until "ruined" was the only term which could correctly be applied to it.

Lester Hall was now half in ruins, a mass of crumbling stone, ivy-covered and moss-grown, with quaint round towers dating back to the Saxon period of our history, and oriel windows and quaint peaks of the Elizabethan style of architecture. Birds had built their nests in the chimneys; ivy and holly were mingling in the cleft of the walls; over the great hall-door the family coat-of-arms and motto, carved in stone, were still legible through the leaves of the Virginia-creeper which clustered over it in the greatest profusion. The terraces were moss-grown and uneven, the lawns rough and unecared for.

"One pair of hands could not do everything," poor Barton said ruefully, sometimes, when he surveyed the neglected flower-gardens and parterres.

Still, notwithstanding all its dilapidation, there was a grandeur, a nobility, a picturesque solemnity about Lester Hall, which would have been irresistible to the antiquary or the poet.

Within, the same still calm was distinctly felt. It seemed to a few who entered that lofty, vaulted hall, with its black oak carvings and stained windows, the "dim, religious light," as if no mean thought could assail one within its walls—as if those who lived there must be pure and lofty and stainless. And yet, alas! the annals of the Lesters proved to the contrary, especially the last three or four of the race, who had been reckless and dissipated, wasting their revenues in riotous living, and leaving the estate more and more impoverished at each decease.

It had been thus in a very great degree with the late Reginald Lester, who had tried every imaginable device for spending the few thousands left him by his father. He had gambled, betted and kept race-horses, and married a woman without a shilling, which last was, perhaps, the only worthy action of his whole career, for Martha Daton was good and beautiful; and although she died three or four years before her husband, she had managed to inculcate into her

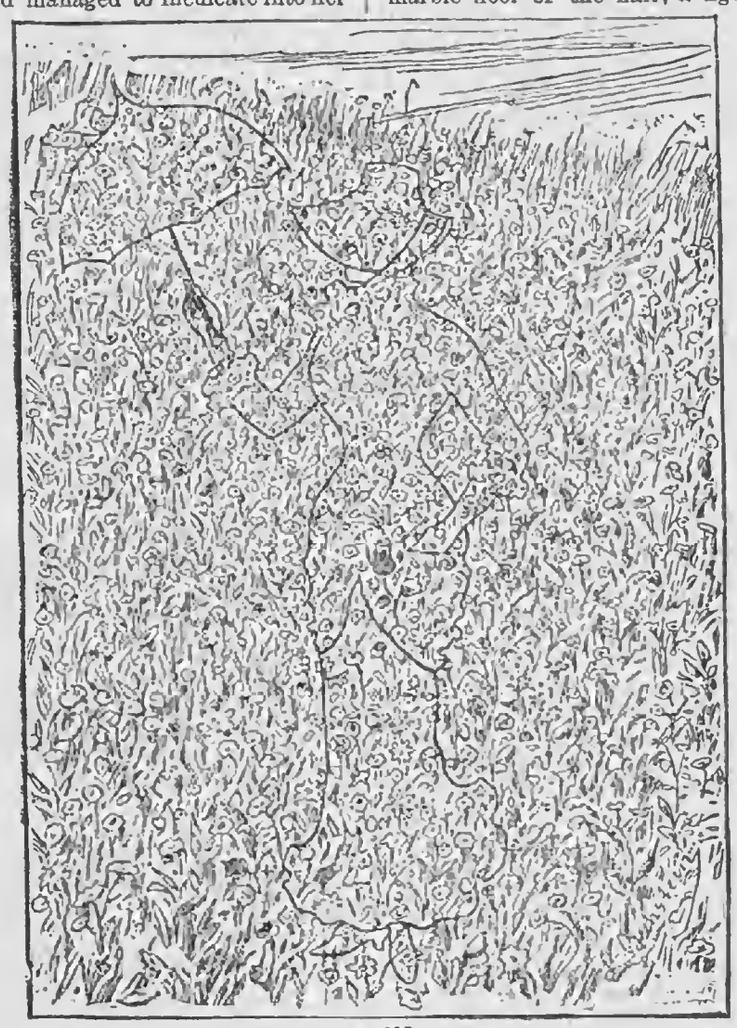

FIG. 298.

children, more especially into the two little girls, whose education was her sole charge, high and noble principles for their future conduct, principles of unswerving truth and persistence in the path of duty, which had been quite omitted by her nobly-born predecessors.

Reginald Lester's death left his children—one boy, Reginald, or Rex, as he was generally called, and two girls, Martha and Cecil—not only fatherless, but well-nigh penniless; for three hundred a-year will not go far in supporting an old family name. But they had no rent to pay, and the household had dwindled down to old Barton and his daughter Fanny, who were steadfast in their attachment to the family, and clung to their diminished fortunes.

The young people lived quietly and within their means, for Martha Lester was at the head of the finances, and she had inherited from her mother a wholesome horror of difficulties, while all that it was possible to dispose of, or sell, or mortgage had been sacrificed already, so that, when the position was faced at Reginald Lester's death, his children knew that it behoved them to be careful.

Unfortunately, Rex Lester had been brought up to no profession, and had not sufficient energy to strike out a path for himself, so that he had nothing to do but idle about the estate, doing a little farming, perhaps, now and then, and keeping the larder well supplied with game during the shooting season.

It was anything but an unhappy life, that led by these young people, although, as I have said, a quiet one. Rex had his gun and his horse; Mattie had her housekeeping and her music. She was an admirable musician and possessed a superb soprano voice; while Cecil had no greater ambition than to sit her horse as well as Rex did, and to be as happy as the day was long. She was the youngest, and at the time my story opens was just fifteen; Mattie was three years older, and Rex was approaching his twenty-first birthday.

A very beautiful but rather delicate-looking girl was Mattie Lester; and as she re-entered the solemn shadowy hall, and passed behind the carved screen which partitioned off a portion of its vast space into a sitting-room, she looked a "fitting divinity for such a temple."

She was about the medium hight, slim and straight, with a wonderful mass of pale golden hair twisted in heavy coils round her head; her features were perfectly regular—her large blue eyes, full of tenderness and sweetness, matching the sweet, tender mouth, about which there was something pathetic and sad, caused in all probability by the loneliness and seclusion of the life she had led.

Her dress, simple in the extreme—almost poor, perhaps—was dainty, and neat, and tasteful, and suited her to perfection; and the soft folds of pale blue linen swept after her with as much grace and dignity as satin or velvet would have done on a less graceful person.

When she entered the sitting-room, Mattie sighed a little, and stood for a moment resting her hand upon the table, lost in thought: then shaking off whatever painful feeling oppressed her, she sat down, drew a large work-basket towards her, and began the homely and prosaic occupation of darning stockings. But however homely, however prosaic her occupation may have been, she made a pretty picture as she sat there, and one which would have delighted an artist.

The heavily-carved oaken chair made a fitting background for her delicate loveliness; the graceful head with its crown of golden braids bent over her work, the slender white hands, the small feet crossed on the stool before her, the large wicker-basket full of needlework. You and I have seen many similar pictures of "interiors" gentle reader, but we never saw a fairer one than the one I have attempted to describe.

Half an hour slipped by without Mattie Lester's solitude being disturbed; the bright slender needle slid steadily through the well-worn socks and stockings, pair after pair was placed on the table, and the pile in the basket was perceptibly decreasing, and an hour had gone by, when there came the sound of a light, quick footstep on the marble floor of the hall; a figure bright with youth and happiness appeared at the door of the carved screen, and Mattie lifted her face with a smile to greet her sister.

"Well, Cecil, and where have you been?" she said, "Over hedges and ditches again as usual?"

"Not exactly. I have been into the village, Mattie."

There was not the slightest resemblance between the two sisters, although, even at fifteen, Cecil's beauty bid fair to equal her sister's. There was nothing pathetic—nothing Madonna-like in the young girl; she seemed full of life, and health, and animation. Her complexion was rich and glowing; her eyes, large, brilliant, and in color of a dark hazel, were shaded by long dark lashes, many shades darker than her chestnut hair; her mouth was beautifully shaped, but the lips had a proud expression, set and resolute. She wore a riding habit of coarse dark blue serge, and a riding-cap to match of home manufacture sat lightly on her clustering hair; and as she came within the screen, she was tapping the skirt of her riding-habit lightly with the slender whip she held.—[To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

MY LADY AND I.

WHAT has my lady that I have not?
Wealth and station and power,
A mansion that over-shadows my cot
As a great tree shadows a flower.

Splendid coaches and high-bred steeds,
Statues and paintings rare;
Whatever she wishes, or craves or needs,
She has but to speak—it is there.

Busts and vases from foreign lands,
All that is bought with gold,
Comes at the wave of my lady's hands,
Like a touch of the lamp of old.

Royal jewels and webs of lace,
Like cunningest works of frost,
She pleases her fancy and suits her taste,
With never a thought of cost.

But what have I that she has not?
Oh! what she cannot buy—
Love to brighten my lowly lot,
Love, and a love-lit eye.

Some one who comes when the night falls down,
And brings back glee and mirth,
Who shuts in the home, and shuts out the town,
And sits with me by the hearth.

Some one who lightens the labor load,
Who makes misfortune vain,
And the loveliest baby that ever crowed
And tapped on the window-pane.

Ah! my lady of royal mien,
You may ride in your carriage fine,
But I am prouder, for I am queen,
Crowned by a love divine.

EXPLANATORY NOTE.

In this, our special number, we have been obliged to encroach upon the room usually devoted to the Literary and Woman's departments to satisfy the demand for space for other pressing matter. Fashions, &c., excluded. R. C.

DESCRIPTION OF CUTS.

FIG. 298.—SHADOW LADY.

The prevailing style of dress for ladies, presents them as floriated pictures from "the crown of their heads to the soles of their feet" almost, literally speaking. The flowers scarcely rival them in picturesqueness. When a lady is walking through a field filled with blossoms it is with difficulty that the eye is able to make the distinction. Where is her shadow in the picture?

FIG. 300.—WATCH STAND EMBROIDERY.

FIG. 301.—DETAIL OF WATCH STAND.

This trifle for a bazar is made ornamental by the addition of embroidery. The stand is of black wood and the embroidery is worked on black velvet in three shades of gold silk. The above detail gives a clear idea of the needle-work portion of its construction.

FIG. 299.—DOILY FOR CAKE OR BREAD-BASKETS.

The doily is of art canvas, and measures ten inches square; it is divided into four squares by an insertion of drawn threads. The squares are ornamented with a design worked in cross-stitch, with marking filoselle of one or two colors. The doily is edged with torchon lace.

FIG. 297.—FICHU.

The fichu here represented is of pale mauve foulard, dotted with violet and edged with lace. It is not necessary to follow the above color and material; any soft silk or lace entire may be used in the making of this popular adornment.

A FINE CHILD.

How He Has Been Reared.

I DINED not long ago with a physician's family and as I was an unexpected guest, the dinner was what was regularly served on Tuesdays, boiled corn beef and cabbage, and potatoes, with relishes, tea and dessert. The dinner was served at half past six o'clock and the four children around the dinner table were between the ages of three and ten years. They dined on precisely what their elders did and there was no protest from anybody against their eating whatever they wished. After their dinner was well swallowed they were put one by one into a bath, rinsed off, rubbed off and put to bed. What their dreams were, or how many times they rolled over and cried and moaned during the night that followed is not a matter of record. Perhaps they slept like so many "tops" and were none the worse for their fare. Indeed, unless they were children of such extraordinary stomach power, we should require a census for the decrease of the population for where one child is reared from birth in an intelligent manner, there are fifty that are not. If parents would only act as intelligently as they know, there would be less cause for complaint.

It is questionable if any woman, unless she has been especially educated for the work, is fit in judgment and discretion to be the best sort of a mother before she is twenty-eight or thirty years

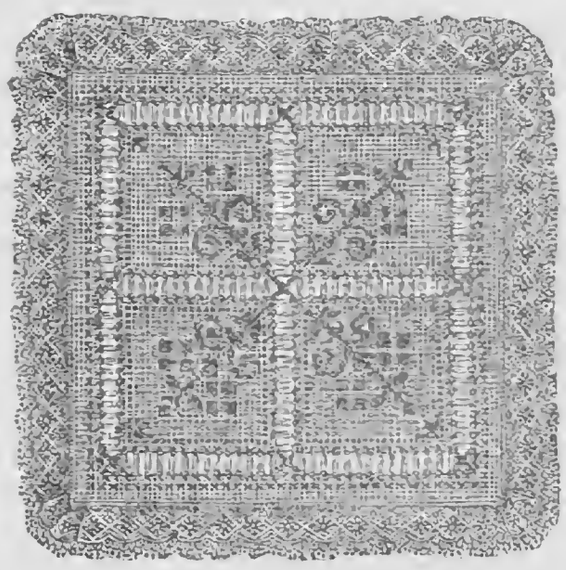

FIG. 299.

of age. Intelligence, and the courage of one's opinions are worth more than experience in the "long run" and "experience" is often well mixed with silly notions and harmful potions as well. The healthiest and happiest child I know, as well as being an extremely beautiful one, is at the time of this writing a little more than three years of age, and as his training has been of an unusual character, I think it worth while to tell the story of the little fellow's three years of life. To begin with, the mother is delicate, the father by no means robust. To them, the birth of a child meant a very serious and earnest matter, and how to give it the best possible hold upon life was made a matter of supreme importance, and, to use an old aphorism, the child "was sent to school before it was born." Regular habits, a select but nutritious diet, and a great deal of out-of-door work dowered the boy with a splendid body, a great bright-eyed, rosy child, who has yet to learn the meaning of suffering.

I have heard the mother say in the matter of dress, that she asked nobody's advice or direction, and wholly followed the guidance of her own judgment. "I tried to put myself in the little fellow's place" and think what would be pleasant or burdensome to me if I were small and helpless." So for the first five or six months (the child was born in the spring time) he wore frocks that merely covered his feet, and his body was never on any occasion burdened with long or cumbersome skirts. He never has had "company" frocks nor a "sash." His clothes, of good material, have ever been of the simplest description, comfort and cleanliness being the two things considered. He wore soft-soled shoes, made by his mother until he was a year old. Since then, his shoes have been generally made to order, and of course without heels. He began to walk when ten months old, and has always been distinguished for his sure footedness, using his feet with great freedom and surety. Before he was a week old, he began to drink from a cup. When he was four months old, his mother began to give

him cow's milk to drink, diluting it with water to about one-third. The quantity of milk was gradually increased until he was six months old when he drank cow's milk undiluted and at eight months he drank no other. He never knew what it was to be "weaned," and he never took his milk from a bottle, his mother regarding a "bottle" as an abomination and entailing a great deal of work. In matter of diet this little fellow's *chief* food has always been milk. In addition to this he has eaten plentifully of fruit—not a day having passed since he had four teeth, that he has not had it in some shape, fresh or cooked. Vegetables of every description that he has liked, simply cooked, he has been allowed to eat freely. Oat-meal mush with milk or cream and a dish of fruit usually constitutes his breakfast. For supper he has bread and milk. If he is constipated, he eats a dish of whole wheat, that has been boiled until soft, which speedily corrects the difficulty. He has a bath every morning, and he has his teeth brushed. He wears shaker flannel chemises the year round of a light quality in the summer time. He seldom wears a hat at any season, rarely a wrap of any description even in winter time, except in riding, and is remarkably free from colds. The absence of hat and coat from his toilette is one of his "freaks"—he detests both.

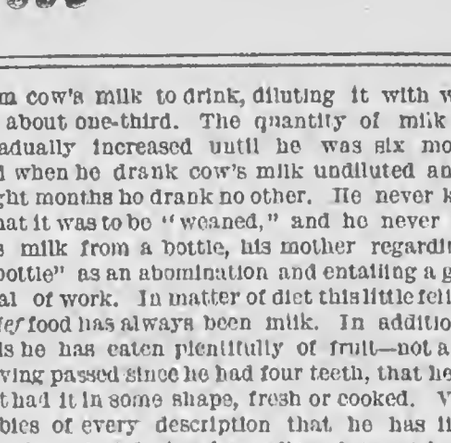

FIG. 800.

Now for the negative part of his diet. He has not been allowed to eat meat, eggs, cake or pastry, fine crackers, raisins, cheese, candy, the skins or seeds of fruit, hot bread, or to "taste" of tea or coffee. Each and all of these articles are absolutely forbidden. He is allowed a small quantity of sugar on berries and oat meal, and he has occasionally, within the last year, eaten of butter. He prefers cream to butter and is allowed all he wants of this as also of good soups. He is taught that he can have meat when he gets his "meat teeth."

When in New York a short time ago, I was telling Dr. James R. Leaming, a very distinguished physician of that city, the method adopted in the training of this child, and he said, "All right, and my advice to his mother is that she withhold meat from his diet until he cuts his meat teeth, which will not be until he is about eight years old." Dr. Leaming then told me in what a high ratio the death rate has been reduced in a Children's Hospital of which he had charge, since meat has been crossed off the list of food for the little ones.

Among other things that the child has *not* had, have been "pokes" and "joltings" from the relations and other people. His mother never allowed him to be tickled and tossed, "boozy-boozled" or kissed on the mouth. "I should not like such things," she argued, and she would not have her child imposed upon. But in his playing he has the greatest freedom. He is well shod for all sorts of weather, has abundant sleep, makes mud pies and molds various things from mud to his heart's content. He constructs most of his own playthings, and learns by heart all the pictures in "Wide Awake" and "St Nicholas." When either of his parents go from home, he expects but one thing upon their return, and that is a kiss, which he counts upon with great glee.

FIG. 801.

Now for the results of this sort of training. The boy has never had a sick day, and with the exception of a cold, never a dull or unwell day. No sleepless nights, no trouble with teething, no fretting, no colic, no headaches, no worms, or troubles of any sort. Never did a child so grow and thrive: his hair full of sunshine, his face a garden of lilies and roses, his eyes bright as stars, his body the perfection of symmetry and strength, his countenance the picture of happiness. It would be difficult to find a match for him outside of England, where the physical development of children is the finest in the world. As might naturally be expected, the mental development of the boy keeps pace with the physical—a masterful little fellow, the leader in play, the captain of mischievous expeditions, very discreet in judgment, strong-willed and persevering, and the most delightful little companion imaginable; when he goes to bed laughing and chattering, nobody feels "relieved," unless it be a "relief" to miss the best, brightest and most radiant thing in the household.

Now, why cannot every child be like unto this one? especially every country child, and it is a wrong to children, that they should struggle up to man and womanhood in a city. It does not seem as if parents realize the immense advantage it is to a human being to have a perfectly healthy body. Money and finery of apparel are not of the least consequence in comparison with it. No man or woman needs to be rich, or learned to rear a child in the way the little hero of this sketch has been reared. I never see a child eating candy and nuts, cakes and confections; undergoing undue excitement, at night; fretful, cross and unhappy, without a feeling of pity at its misfortune. I feel at once that its mother lacks the very first element of fitness to be a mother—conscientious sense of her duty, or a lack of firmness to do it.

Health, happiness and usefulness are largely synonymous—remember that.

MARY WAGER-FISHER.

HOME USE OF FAIRS.

VELENA.

It is a well established fact that whatever has a refining tendency is well worthy of consideration; and also that whatever tends to developing our practical natures is equally worthy of consideration.

Men, women and children grow weary of anything monotonous unless interspersed with something quite different, something interesting, pleasing or profitable.

Work of one kind is more distasteful than work of several kinds. A girl washing dishes soon grows to disliking it, but vary her work and she will do double the amount with better grace and better health. Teach her how to handle a needle deftly in doing fancy work nicely, and the chances are she will do the mending of her every-day clothing well. Make it a point never to allow anything to be done carelessly and then left; if it is only half done have it done over again immediately and well done.

Some persons may scruple against permitting young girls to idle away their time doing fancy work, but, if the girl will have to earn her own living as she grows older, there is no way in which she can make a better one than by doing "art embroidery," providing she does it well enough. If poorly done, there would be no sale and consequently no living.

Crocheting brings a good price, too.

If she is embroidering for home use, it has its beneficial results. A neat piece of work is a credit to any room and creditable to anybody.

Odds and ends of bright colors appliqued on a solid ground cost but little and made in a bracket lamb equin, are an adornment to any room.

I have been where a whole household was pleased and proud of "our girl's work," and I am sure the girl grew to be a better woman through that just pride imbued by her family.

There may be those who have a natural taste for doing such things, but with this taste there wants to go some knowledge; there must be some insight of what is being done by others and the manner in which it is done; and to those residing on farms distant from cities the *Fair* is the great school for them. There is exhibited a variety of work, done in various ways and with varied material, for a great many uses.

Not a hurried glance but a *good look* has many times enabled me to make both useful and ornamental articles, and they in their turn have suggested others of taste and value. These also have been duly taken to the Fair the next year, and the probabilities are that some one else has copied them, while the premium awarded more than paid me for the trouble taken to make the exhibit.

It being quite the thing now to *knit* edgings of different widths in white and color for trimmings, we shall look to see new patterns at our Fair, we hope also to see some of the new "ribbon work" there.

If we all take an interest in our Fair and each one contributes something, it will be surprising to find what an array one small town can make. What a good feeling is engendered looking over the various products raised by our neighbors, or the articles made by our neighbors' wives. Do we not feel as though our associations were better and our advantages greater; in fact, do we not know they are in a *thriving town?*

What better place is there to display the worth of the land, the dairy and the household than at a Fair? Do not the horses, the cattle, the grains and the fruits tell all about the man? While the butter, the canned fruit, the bread, the cake, the knitting, the sewing and the crocheting, the penciling and painting, tell equally well about the woman?

Nothing is really lost, if industry reigns, it speaks for itself, if idleness is prevalent, it makes its presence known.

Any one may well be proud of a *good* Fair. To make it such, the subject needs a good deal of agitation; neighbor must talk with neighbor, and each and every one do all in their power toward contributing to its usefulness. Strive to raise a general interest in it throughout the neighborhood, for it is the great advertiser of your own, your neighbor's and your town's value.

Do not let it run to "racing" wholly, but make it a place of learning, a place of sociality and enjoyment, a place that will have a good effect "all the year." And, further, make it a point to go to the Fair and have all the family go. Then do not hurry from one object to another, but what you do see, look at until you have it fixed in memory, then take another article or object in the same way. Different ones of the same family may have different objects of interest and each, having carefully noted certain things, can talk them over intelligently at home.

Old people naturally see things quite differently from young eyes, and it is often well for the two to look at the same object together. Points will be noticed and comparisons made that often tend to developing new ideas—ideas of practical value in coming days and such as can easily be carried out to considerable advantage.

A DARNING BASKET.

MATERIALS, a discarded peach basket, a black or old gold-colored skirt braid 1¼ yards black and old gold cretonne, one quarter of a yard of pale-blue Silesia.

The basket I covered was a peach basket with wide splints, sloping abruptly from the top to a narrow bottom. They can be bought now for five cents.

Measure on the outside from the top to the center of the bottom, and around the top fold the cretonne and bind the fold with the braid. Mark the side of the cretonne that is to go inside the basket into as many spaces as there are members in the family whose hose need weekly embroidering, and stitch the blue Silesia upon it in pockets, making a small box-plait at the bottom for the fullness. Embroider the initial of the owner on each pocket and bind with black braid.

The pockets are set two inches from the top of the basket. Sew the cretonne together; run a shir in both the lining and the outside cover; slip it over the basket, draw it tightly and tie it. If the crotonne is genuine it will wash without fading. The cover can be taken off very easily.

O. W. DAY.

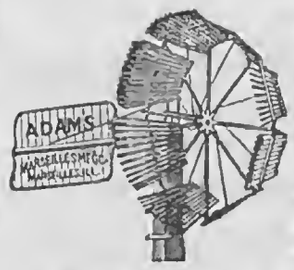
ENTERPRISE
WIND MILL,
For railroad and city water works, IRRIGATING AND FARMING PURPOSES. Solid wheels, multiplying ball governor, perfectly self-regulating. Every one of our mills is fully warranted. Send for illustrated circular to

SANDWICH ENTERPRISE CO.,
Sandwich, Ill.

IMPROVED CALIFORNIA
WIND MILL.

Simple, Strong, Durable. Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers, CLARK & CO., SOMANAUK, ILL.

I. X. L. WIND MILL.
For Simplicity, Durability and Power *this mill has no equal.* It runs equally well in light or heavy winds. Ice and sleet do not effect it. Works well under all circumstances; never gets out of order. We warrant all our mills. Circulars and descriptive catalogues sent free on application to the Phelps & Bigelow Wind Mill Co., Kalamazoo, Mich.



Adams Wind Mill
Works in a lighter breeze than any other. Governs itself perfectly. Its operation can not be interfered with by ice or sleet storms. Well made, Strong, Durable. Illustrated circulars of all our goods sent free. Address MARSEILLES M'F'G. CO., Marseilles, La Salle Co., Ill. Send for Catalogue "C."

CHALLENGE WIND MILLS
Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merits. Mills sent on 30 days' trial. Best Feed Mills, Corn Sheilers, &c., &c. Catalogue free.

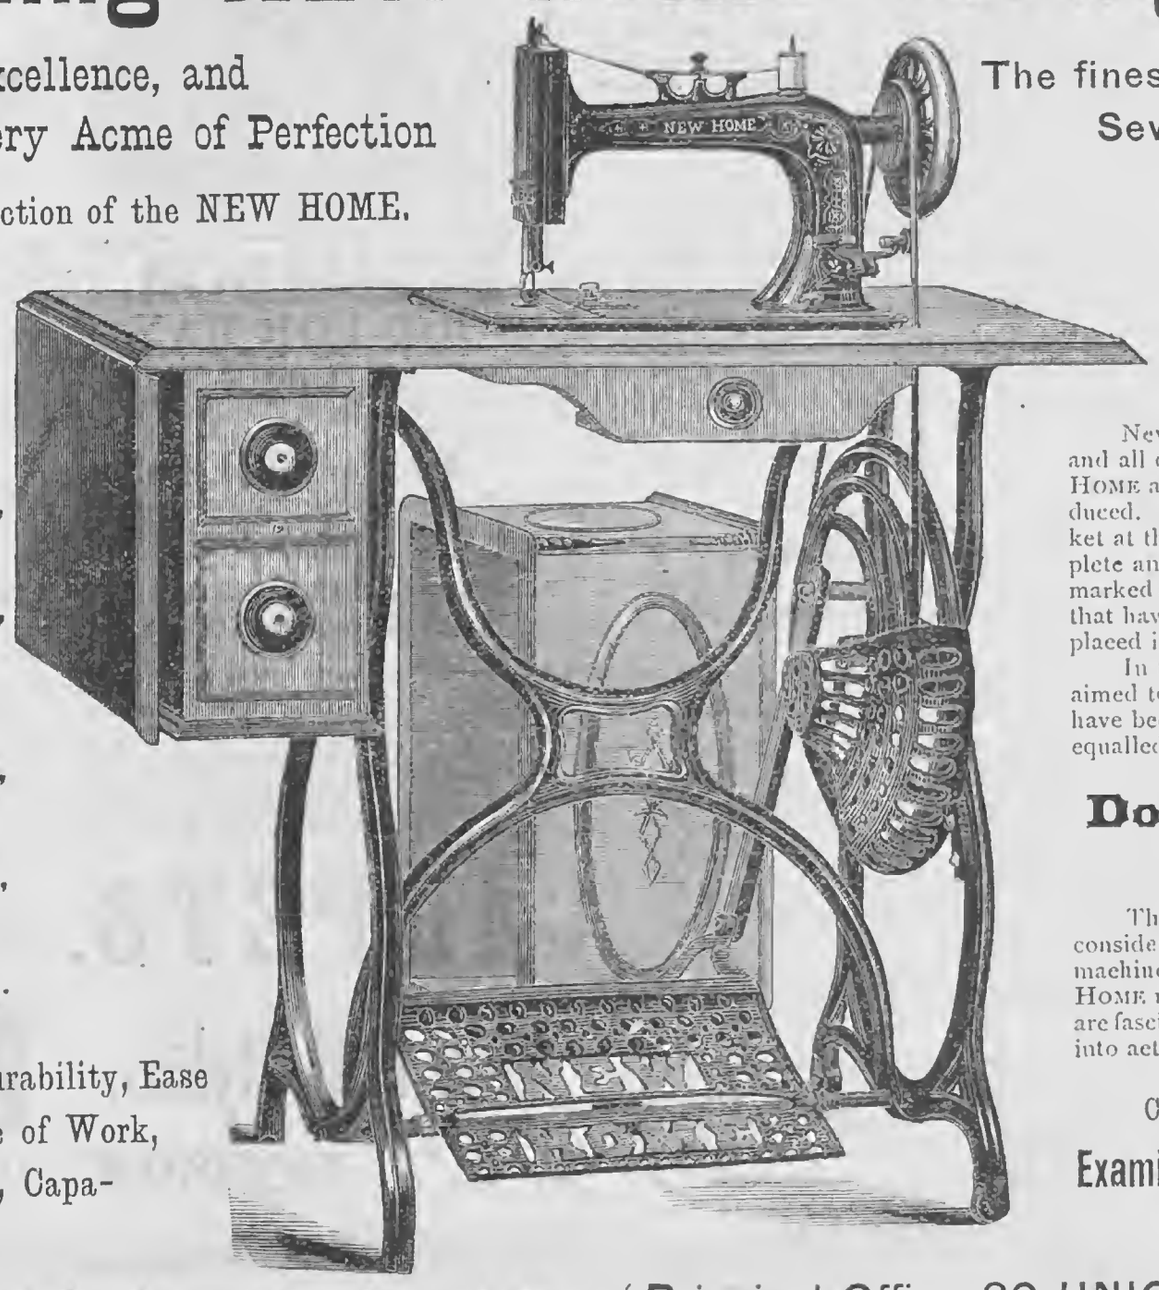
THE LEADING MACHINE OF THE DAY.

THE

Light-Running NEW HOME Sewing Machine.

The Highest Degree of Excellence, and
The Very Acme of Perfection

Have been reached in the production of the NEW HOME.



The finest and most perfect piece of Sewing Mechanism ever invented.

IT COMBINES THE GOOD POINTS OF ALL OTHER MACHINES WITH NONE OF THEIR DEFECTS.

Points of Superiority.

Self-Setting Needle,
Automatic Tension,
Self-Acting Take-Up,
Large Space Under Arm,
Loose Balance Wheel,
Scale for Regulating Stitch,
Large Bobbin,
nical Bearings,
Powerful Feed,
Elegant Ornamentation,
Working Parts Case-Hardened,
Casters in Stand.

New and valuable improvements have been added, and all complications avoided, thus placing the NEW HOME at the head of all Sewing Machines hitherto produced. There are many machines of merit in the market at the present time, but none can be found so complete and perfect in every detail. None possess the marked advantages, superior worth or stalwart excellence that have rendered the NEW HOME so famous, and placed it far in *advance of all its competitors*.

In the construction of the NEW HOME, we have aimed to reduce friction to the minimum. Our efforts have been successful, and the result is a machine unequalled for *lightness of running*, and which

Does not Fatigue the Operator.

This is a very important point for the purchaser to consider, as it is a well-known fact that heavy running machines are extremely injurious to health. The NEW HOME requires so little effort to operate, and its results are fascinating to such a degree, that labor is transformed into actual pleasure by its use.

Noted for Extreme Simplicity, Durability, Ease of Management, Wide Range of Work, First-Class Workmanship, Capacity and Speed.

Comparison with other Machines Invited.

Examine it Before Purchasing any Other.

Descriptive Circulars free on application.

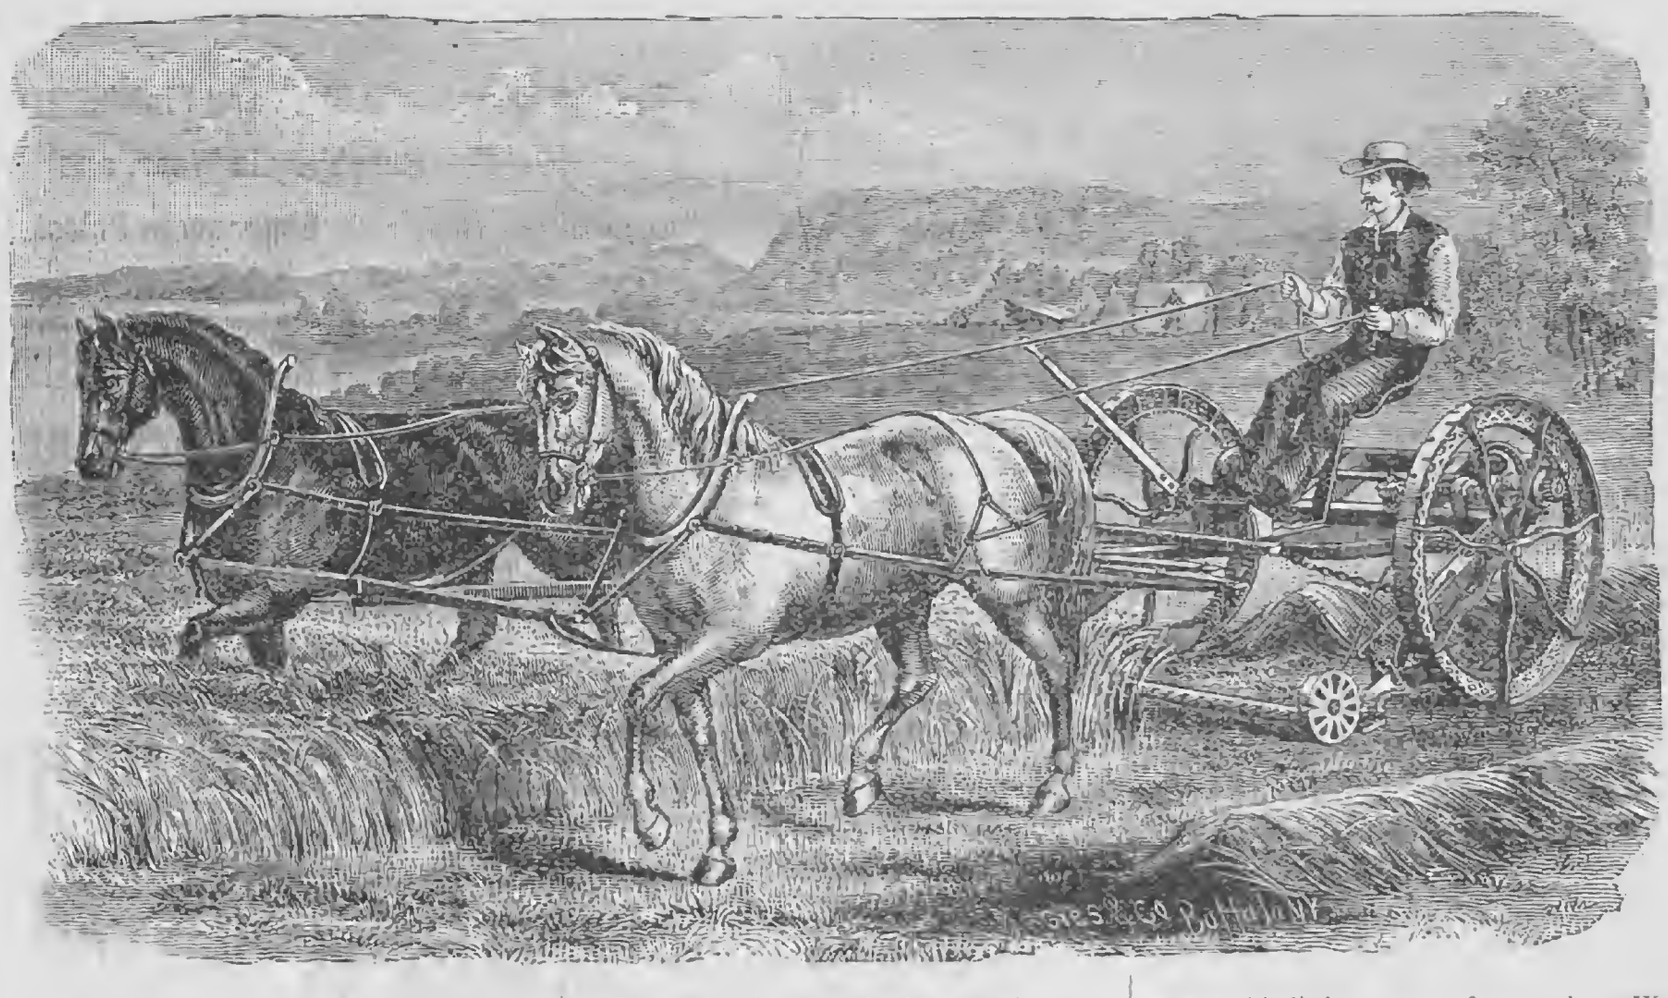
WILBER'S
DIRECT DRAFT

Eureka Mower.

Six Feet Cut.



The Best Mower in the World.

The most remarkable occurrence that has ever taken place in this vicinity, and no doubt in the State, was the cutting of 13 acres of grass on Monday last, by W. F. Ely, of Columbia, from 7 o'clock a. m. to 12:20 p. m. of the same day, and at 6 p. m. the hay was in the barn. The grass was cut with an Eureka Mower, which leaves the grass standing, and with his carrier it was taken to the barn. We think that this feat is worthy of publishing.

From the Morris County Chronicle of July 2, published at Morristown, N. J.

"In reply to your inquiry as to the Eureka I have this to say: after trying what I believe to be the best self-raking reaper (the Johnston Harvester) I found my 6 feet Eureka Mower very much superior, in that it left the Barley spread over the ground perfectly loose, so that the sun and air could act upon it. Neither the horse's hoofs nor the wheels of the machine packing it to the ground, permitting it to dry in a few hours, besides cutting it much cleaner than any appliance that I have ever tried."

GEO. W. HOFFMAN.

From the Husbandman, Elmira, N. Y., March 10, 1880.

The Eureka was the lightest draft of all that were tried.

JOHN COLEMAN,
Chn. of Judges on Group XXIII, Centennial Com.

I never want to take a side-cut machine into my orchard again. I have not found the place where I do not like the Eureka better than any side-cut machine I ever saw. It gives the most absolute satisfaction.

W. I. CHAMBERLAIN,
Hudson, Ohio.

It is certainly the king of mowers and I would not exchange for any side-cut machine in the world, and *I have used the best of them.*

GEO. K. SMITH,
Monroe, N. Y.

I opposed the Eureka as long as it was honest to do so. Now I would rather pay a reasonable price for the Eureka Mower than use any side-cut machine furnished me for nothing.

E. C. SPENCER,
Wysox, Pa.

It cuts a wider swath, draws easier, and leaves the grass in better condition to cure and rake than any side-cut machine I ever saw.

T. R. NOONAN,
Addison, Vt.

We have used on our farm Ball-Ohio, Buckeye, Champion, Climax, Clipper and Hubbard Mowers, and have used the Eureka *ten years*, and say the Eureka is the best mower.

E. W. CHAMBERLAIN,
Sullivan, Ashland County, Ohio.

After using the Ketchum, the Wood, and the Buckeye, I have settled down on the Eureka Mower as superior to any side-cut machine I ever used or saw in use.

HARRIS LEWIS,
President New York State Dairymen's Association.

We have used the Eureka Mower to cut about 150 acres yearly during the past *eight years*, with little expense for repairs. We consider it in all respects the best mower in use.

J. O. WALKER, G. M. ADAMS,
Ferrisburg, Vt.

We have owned the Eureka Mower six years, and have used it in all kinds of grass. We have never yet found a place where it did not do good work, nor have we ever had a mower that would equal it.

D. E. FENN & SONS,
Talmadge, Ohio.

I have used a mowing machine for twenty years and consider the *Eureka* the best.

SAM'L. C. COLT,
Hartford, Conn.

I have used a five feet cutter-bar Eureka Mower the past five years, and like it so well that I have purchased a six feet cutter-bar, believing that a six feet machine will work easier for driver and horses than any four feet side-d raft mower now made.

I. GIBNEY, Tarrytown, N. Y.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

A SUGGESTION.

To those of our housekeeping friends who attend the fairs and are interested in the prize bread, butter, canned fruits and the like there exhibited, we would suggest that they find out from exhibitors, if possible, the various methods employed by them, which lead to such happy results. It is to be regretted that all who exhibit such articles are not required to furnish minute particulars as to how they are made or prepared, so that all might use such information for their future benefit.

EXHIBITION WEEK.

ANNIE L. JACK.

I HOPE the mothers and fathers of our RURAL young people are prepared to take their children to the fair. It is a part of education that should not be neglected, and opens their eyes to comparisons, while exciting a spirit of emulation. "We have as good as that at home," I heard a young lad say one fair day when examining the fruit, and the next year his name was on the list of prize-winners. So it is in many things, and I have often observed that the children seemed brighter and better for their journey, besides feeling that they were of some importance in the world when they are allowed the trip with older people who may hitherto have enjoyed the privilege. Let the boys have some poultry or animal to show; the girls, some flower or fruit they can watch the season through, and then exhibit as the result of their care. Even if they do not win a prize (and *all* cannot), the trial will not be lost, but incite them to further attempts. If one shows a talent for housekeeping, let her exhibit canned fruit or a loaf of bread of her own making; and if the boys have any mechanical skill or genius in any direction, let it be encouraged and made the most of. The contact with others, the varied display, the diversity of arrangement and method of exhibiting will not be lost to their young, observing eyes; and if father and mother instruct them in the survey they will be amply repaid by the keen, eager scrutiny that will be given. By all means take the children to the fair.

The "Fair" Lunch Basket.

We thought it better to provide a lunch, as the hotels were likely to be crowded, and the "gudeman" and the boys thoroughly appreciated the idea. So a pan of rolls was made with one pint of milk, two eggs, three tablespoonfuls of yeast, two of butter, a little salt, and flour enough to make a soft dough. The milk was warmed and the eggs and salt added, the former, of course, well beaten, and the butter rubbed into the flour as for paste. Three or four hours in warm weather are long enough for it to rise, and when made into small rolls they were tempting enough with good butter. Bnt between some of the cut rolls we put slices of cold chicken, and in others, for variety, grated cheese, rubbed in with hard-boiled eggs seasoned with pepper and salt and spread on the bread. This is a change from simple bread and cheese, and is sure to be appreciated. A few early apples, a flask of tea, and a piece each of good home-made gingerbread gave our fair-goers a feeling of independence, and insured wholesome food, to which they added, by purchase, some milk, and came home satisfied with the contents of their "fair" lnnch basket.

OUR OVER-WORKED HOUSEWIVES.

MAY MAPLE.

THE Spring work is done, the harvest is past. The hurry and worry of months are over, and the over-weary wives and danghters sit down "of an afternoon" with a sigh of relief and a glad thought that at last there is a little time for rest. The generality of farmers' wives should have less cooking, less dishwashing and fewer beds to make than did the matrons of 25 years ago. Mowing machines, horse rakes, and reapers make short work of disposing of hay and grain, and, of course, fewer men are required to do the same amount of work. Then, why should farmers' wives have reason for so much complaint about the kitchen work, during the Summer months. Let me give a few of the reasons:

In not a few localities we find a strife among the housewives, as to who shall carry off the palm for the best cookery. And so, day after day, we find the farmer's table overloaded with cakes, pies and puddings in endless variety, that, judging from RURAL recipes alone, require hours of hard labor to manufacture.

Our farmers' wives are growing more and more ambitious; they are anxious to emulate their city sisters in dress, house furnishing, and general surroundings. To do this is often out of the question when the woman's purse is to be supplied from the surplus fund, raised from the farm. So they take upon their shoulders various other so-called duties, and to their already multifarious cares, they add the business of poultry raising, and in the Spring make calculations on raising from 50 to 200 chickens, and a drove of turkeys, geese and ducks for the holiday market. With the proceeds they hope to buy new silk gowns, cloaks, hats, boots and gloves *ad infinitum*.

The Summer is past and what reward have ye? Because one or two strong, energetic women in your vicinity can succeed in carrying on all their household affairs and raise famous vegetables and poultry, besides canning fruit by the hundreds of gallons, and thus fill their purses with shining coin, is it necessary for all the rest to follow in the same path? It is certainly this over-ambitiousness that is wearing out so many of our country women, and entailing so much misery and invalidism upon our farmers' wives.

Plain dress and plain fare do not satisfy us as they did our mothers and grandmothers. If they did, we should have no call to pity the farmers' wives of the present day who are blest with so many labor-saving machines, indoors and out.

NOTES IN THE KITCHEN.

MARY WAGER-FISHER.

IN canning fruit, a tin funnel with a mouth that fits in that of the jar, is a great convenience and prevents the fruit from being spilled.

Tart, juicy Fall apples make good jelly. I find it advantageous to boil the juice of fruit in jelly making to quite a consistency before adding the sugar. Lay over the top of all jellies a round of white paper dipped in brandy. If mold appears, it takes its seat on the top of the paper.

To have good dried sweet corn, cut the corn from the freshly husked cob, scraping it well, so that the milk of the kernels is secured. Put the corn into earthen or tin dishes, and set in a hot oven—hot enough to scald the milk in the corn. Then dry it as quickly as possible without burning. Finish off by heating it hot; then put it in strong paper bags, tie, label and put away in the preserve closet. When you wish to cook it, put a cupful to soak in sweet milk for two or three hours before cooking. The principal thing in drying corn successfully is to have the milk in it heated so thoroughly, and the drying done so expeditiously, that it does not become soured in the process. It can readily be dried within a day or two.

COOKING TAPIOCA.

ELINOR BROOKS.

A DESSERT which never fails of meeting general approval in our family is

TAPIOCA CREAM.

One pint of rich milk, two eggs, two tablespoonfuls of sugar, lemon extract one teaspoon scant full. Soak two tablespoonfuls of tapioca over-night in water enough to cover. (It is better soaked over-night, but I have often used it after soaking only two or three hours, keeping it slightly warm.) Scald the milk by setting it into boiling water; then put in the tapioca and let it boil a few minutes, or until it rises to the top in little grains; then add the yelks of the eggs and sugar beaten together. Beat the whites to a stiff froth and lay on the top; let it scald through; then with only one or two whisks with a spoon stir together very slightly; pour out into molds and set away in a cool place—on ice if you have it. To be eaten cold without sauce. To satisfy the demands on it I usually have to double or treble this recipe.

I have tried using rice in this way, but the grains are so much heavier that it is not so nice.

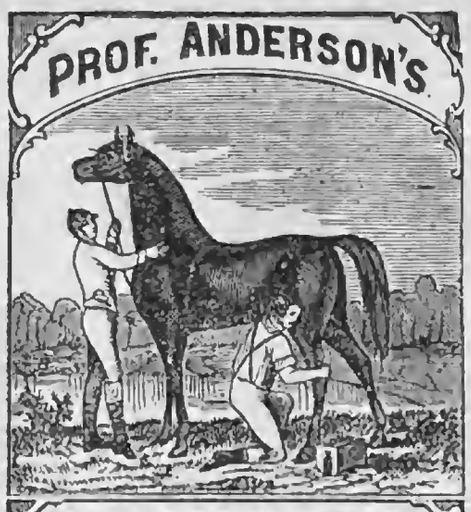
TAPIOCA PUDDING.

Dissolve one teacupful of tapioca at night in one quart of water; next morning pare and core six tart apples; stew them until tender in an earthen pudding dish; add sugar and lemon to the tapioca; pour it over the apples and bake until the whole becomes a jelly. To be eaten cold with cream and sugar.

A Word to Our Readers.

When you read of a remedy that will cure all diseases, beware of it; but when you read of a pure vegetable compound which claims to cure only certain parts of the body, and furnishes high proof that it does this, you can safely try it and with the assurance that it will help you. This is just what Warner's Safe Kidney and Liver Cure does. It cures all troubles of the lower portion of the body and none others. It will not help the tooth-ache, ear-ache or consumption, but it will put your body in a vigorous and healthy state where you can enjoy life and appreciate its good things. Try it.

GOOD FOR MAN AND BEAST.



DERMADOR.

GOOD FOR MAN.

Inflammation of all kinds. Diphtheria, Wounds, Bruises, Burns, Sprains, Rheumatism, Sore Throat, Swelling of the Glands, Inflammation of the Eyes, Broken Breast, Frost Bites, Chilblains, Piles, Bee Stings and all sores.

GOOD FOR BEAST.

Fresh Wounds, Galls, Sprains, Bruises, Cracked Heel, Ring Bone, Poll Evil, Wind Galls, Spavins, Sweeney, Founder, Lameness, Sand Cracks, Scratches or Grease, Mange, Horse Distempers, etc., etc.

Cures Garget, Sore Teats and Bags and all Sores and Swellings in Cows & Oxen.

For more extended remarks and for a large number of testimonials voluntarily sent to us by the persons whose signatures are attached, we refer you to our Circular Pamphlet around each bottle.

We would say to Livery Stable Keepers, make it a point never to be without this great remedy. It is a cheap, efficient and SURE medicine. With this "Dermador," there is no such word as "FAIL." It never blisters, but cools. Price 25 and 50 cents. Sold by all druggists. D. RANSOM, SON & CO., Buffalo, N. Y.

POULTRY, GAME, BUTTER and PRODUCE

No. 279 Washington St., N. Y.

Ref., *Irving National Bank*, New York City.

Cornell University

AT ITHACA, N. Y.

Was founded partly on Land-Script donated by Congress, and is bound to teach, besides other things, all the branches relating to

AGRICULTURE & MECHANIC ARTS.

In the full course in AGRICULTURE, there is no charge for tuition. The students in that course are bound to pursue certain studies, viz:

Mathematics, English Composition, German, Free-Hand Drawing, Chemistry, Geology, Botany, Horticulture, Entomology, Veterinary Surgery, and Physics,

besides working in the fields and attending

LECTURES ON AGRICULTURE.

They may also study anything else for which they have time. There are

TWELVE COURSES OF STUDY

in different branches, which lead to degrees, viz:

AGRICULTURE, ARCHITECTURE, ARTS, CHEMISTRY AND PHYSICS, CIVIL ENGINEERING, LITERATURE, MATHEMATICS, MECHANIC ARTS, NATURAL HISTORY, PHILOSOPHY SCIENCE, SCIENCE AND LETTERS.

Students not seeking degrees may select their own studies, and special students may devote themselves to one or more.

Students may enter at any time. For full information apply to the Treasurer.

VASSAR COLLEGE,

POUGHKEEPSIE, N. Y.,

For the Liberal Education of Women.

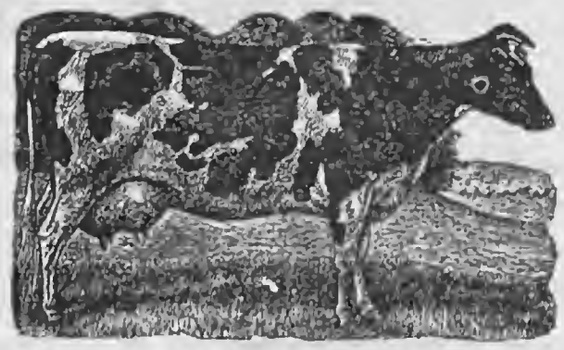
Examinations for entrance Sept. 15. Catalogues sent on application to W. L. DEAN, Registrar.

TENTS

CHAS. M. GIBBS & CO.,

44 Railroad Street, Syracuse, N. Y., U. S. A.

Manufacturers of Awnings, Tents, flags, Hay Caps, &c., &c. We also keep in stock a large assortment of Tents of all sizes, from 9x12 to 80x120, that we rent on reasonable terms for fairs and exhibitions of all kinds. Also, Cots and Flags to rent. For circulars and further particulars, address as above.



[Netherland Queen]

Two year-old; record, 13,574 lbs. 3 oz.

LAKESIDE STOCK FARM.

Holstein Cattle,
Clydesdale Horses,
Hambletonian Horses.

Largest importers and breeders of Holstein cattle in America. Also, large importers and breeders of Clydesdales and breeders of Hambletonian horses. Send for catalogue.

SMITHS & POWELL,

Syracuse, N. Y., U. S. A.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore necked horses or mules that has ever been produced, and has been greatly improved since Jan. 1, 1880. The new pad of proper sizes, with iron loops in top, can be buckled close at the top if desired. Being of smooth metal they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and Harness Makers generally. Ask your Harness Maker for them. Manufactured by

ZINC COLLAR PAD CO.,

Buchanan, Mich. U. S. A.

Cotton Seed Meal.

Shipments made to all sections of the country. Send address for circulars and Price-Lists. The trade supplied by the car-load at the lowest market rates.

90 Broad St. New York,

WHITE LEGHORNS.

A few choice birds to spare from prize-winning strains for $3 to $10 per trio. Also one pair fine Rouen Ducks. Price $5.

W. C. BACON, Potsdam, St. Lawrence Co., N. Y.

BRIC-A-BRAC.

I THANK the Lord that there is one thing in this world that money kant buy, and that iz the wag uv a dog's tail.—Josh Billings.

A CYNICAL exchange remarks that "lies go by telegraph, while the truth comes in by mail three hours late."

"ALCOHOL will clean silver." Yes, alcohol well stuck to, will clean all the silver you have—out of your pocket.

A CORRESPONDENT wishes to know if the "Lay on MacDuff" was one of Shakspeare's earlier poems.

"BEAUTIFUL lives have grown up from the darkest places, as pure white lilies full of fragrance have blossomed on slimy, stagnant waters."

NEVER tell a girl you love her
'Till you think her pa is willin';
Never tell a man he's honest,
When you think he is a villain;
Never think you are so funny
That your wit will live forever;
Never use that old expression,
Weak and weary: "Hardly ever."
—Oliver Wendell Holmes.

No, Cleopatra's needle was not imported for any of the sewing schools of New York. It was simply sent with an eye to holding the thread of a story.

THE flowing reporter who wrote, with reference to a well known belle: "Her dainty feet were incased in shoes that might be taken for fairy boots," tied his wardrobe up in a handkerchief and left for parts unknown when it appeared the next morning: "Her dirty feet were incased in shoes that might be taken for ferry-boats."

2 lovers sat beneath the shade,
And 1 un2 the other said:
"How 14 8 that you be?
Have smiled upon this suit of mine;
If 5 a heart, it palps for you—
Thy voice is mus melody—
'Tis 7 to be thy loved 1, 2—
Say, 0y nymph, wilt marry me?"
Then lisped she soft: "Why 13ly!"

"Yes," observed a friend the other evening, "she certainly is very highly cultivated, she is very stylish, plays well, sings well, talks well, dances well, and rides well, and succeeds admirably in private theatricals. In fact," he added, "she is just one of the kind of girls you'd like one of your friends to marry." "Then you wouldn't care to marry her?" "By no means, my dear fellow. What I am looking for is a real nice girl."

TRANSPOSITION.

Be pleased my worthy friend, to name
A word of letters five,
Without the aid of which, I guess,
We none of us should thrive;
Transpose the same, and then you'll see
I'm black, and brown, and gray,
And I am brushed and duly cut
By thousands every day.

IF a man have love in his heart, he may talk in broken language, but it will be eloquence to those who listen.

If a man is determined to do the best he can, whether he drives a cart, conducts a business of a million dollars, or preaches the gospel, he cannot fail.

Frivolity under whatever form it appears, takes from attention its strength, from thought its originality, from feeling its earnestness.

I'VE searched my Worcester through and through,
I've hunted in my Webster, too,
Apart and both together;
Yet I can't find why men should speak
Of broiling days, which last a week,
As a long spell of weather.

Those books, as far as I can see,
In spelling weather do agree
Quite well with one another;
And though I've sought, and am not blind,
The only spells that I can find
Are whether, wether, weather.

HANNEMANN, the founder of the homœopathic school, was one day consulted by a wealthy English lord. The doctor listened patiently to the statement which the patient made to him. He took a small phial, opened it, and held it under his lordship's nose. "Smell! Well, you are cured." The lord asked in surprise, "How much do I owe you?" "A thousand francs," was the reply. The lord immediately pulled out a banknote, and held it under the doctor's nose. "Smell! Well, you are paid."

THE FRIVOLOUS GIRL.

HER eyes were bright and merry,
She danced in the mazy whirl;
She took the world in its sunshine,
For she was a frivolous girl.

She dressed like a royal princess,
She wore her hair in a curl;
The gossips said: "What a pity
That she's such a frivolous girl."
—Steubenville Herald.

TWENTY YEARS LATER.

She's a wife, mother, a woman,
Grand, noble, and pure as a pearl,
While the gossips say, "Would you think it,
Of only a frivolous girl."

A MAN lost a bag of potatoes off his wagon as he came into the city one morning, and as he did not become aware of his loss till he reached the market, he felt that it was useless to search for it. He felt the loss very keenly till suddenly realizing that there was a bright side to it. Then his face put on a smile, and he chuckled: "Come to think of it, it was one of those two-bushel bags which didn't have but a bushel and a half in, and the finder will get swindled out of half a bushel at least!"

A WISE LANDLORD.

ONE night, a judge, a military officer, and a minister, all applied for lodging at an inn where there was but one spare bed, and the landlord was called upon to decide which had the best claim of the three.

"I have laid fifteen years in the garrison at B.," said the officer.

"I have sat as judge twenty years in R.," said the judge.

"With your leave, gentlemen, I have stood in the ministry twenty-five years at N.," said the minister.

"That settles the dispute," said the landlord. "You, Mr. Captain have *lain* fifteen years—you, Mr. Judge, have *sat* twenty years—but the aged pastor has *stood* five and twenty years, so he certainly has the best right to the bed."—Charleston Mercury.

A CHILD'S IDEA OF THE SEA.

A Family going north from Raleigh recently, took the boat at Norfolk after dark. Next morning the little girl awoke and scrambled up to the window and looking out on the broad Atlantic exclaimed, "Oh mamma, do get up here and see, the front yard is full of water."—Raleigh (N. C.) News.

For close confinement, want of air, sedentary habits and brain and nerve-tire, trust in Hop Bitters.

Reliable SEEDS

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Queries about Cheese.

H. C. H., Rockville, Conn., asks, 1, what it would cost to start an ordinary cheese factory; 2, about how much do cheese manufacturers pay for milk in different localities, and, 3, how much cheese can be made from one gallon of milk.

ANSWER BY PROFESSOR L. B. ARNOLD.

1. The cost of cheese factories varies widely according to cost of material used for building and the elaborateness of finish and size of factory. A structure large enough for the milk of 500 cows costs, as they are generally built, about $2,000. To build a manufacturing room and curing house in separate buildings, as they should be, will, at the average prices of material and labor in the country, cost about $3,500. They are sometimes built for less, and then again they sometimes cost $5,000. 2, The price cheese manufacturers pay for milk is generally regulated by the price of cheese. Milk is almost always bought by the pound at factories, and as 10 pounds of milk, on an average, make one pound of cheese, the price paid for 10 pounds of milk is that of a pound of cheese, less the cost of making and marketing, which is generally reckoned at two cents a pound 3. The weight of a wine gallon of milk (231 cubic inches) having, at 60°, a specific gravity of 1032, is 8 6 pounds. The amount of cheese which a gallon may be expected to average may be estimated from the above data.

W. H, Watkins, N. Y., asks, what State in the South is best adapted to sheep husbandry, and what part of that State.

ANS.—East Tennessee and Georgia offer great opportunities for keeping sheep. Nashville is the point in Tennessee by which the Cumberland table-land, the region referred to, may be reached. In Georgia the piney woods region not far from Atlanta is a favorable locality. A person looking for a location should visit the places mentioned and correspond with J. B. Killibrew, Commissioner of Agriculture, Nashville, Tenn., or Dr. Janes, Commissioner of Agriculture, Atlanta, Georgia. Lands in these places can be procured cheaper than in the West.

C. C. Damascus, Pa, asks how many different patent beehives are there.

ANS.—There have been numerous patents granted on hives—probably over 300—since the patent of Mr. Langstroth on the movable frame expired. Patented features in beehives have been looked lightly upon by the practical apiarists, hence all that is of any practical value in the hive line at the present time is free property for any one to use.

N. B. Many questions and answers are unavoidably held over.

[Cincinnati Irish Citizen.]

Mr. Thomas Lewis, 62 Butler Street, informs us that for seven years he was afflicted with that dreadful malady, Sciatica, and being induced to try St Jacobs Oil, found almost immediate relief therefrom, and is now perfectly cured.

$250.00 CHALLENGE $250.00
We offer above to any color that will excel
Mrs. B. Smith's Butter Color.
What we claim for our BUTTER COLOR is: 1, it has no taste or smell, and is as harmless as water. 2, it is liquid, is easy to handle, and is mixed in the cream before churning. 3, produces a color resembling golden June grass butter. 4, it is the only article that will color the butter and not the buttermilk. 5, it gathers all the butter materials, and increases the weight more than enough to pay for the color used. 6, the color of the butter *never* changes. In short, it is decidedly the best article for the purpose ever offered for sale. For sale by your druggist or country store. Manufactured and for sale by

The knives are of saw-blade steel. Are also made for brace. State which is wanted. Sent by mail prepaid to any address, on receipt of 50 cents. Liberal discount to agents.
WILLARD BROS. & BARTLEY, Cleveland, Ohio.

HOME NEWS.

The custom-house at Nashville, Tenn., though ready to receive the roof, has had no wood whatever used in its construction .. ....The extremely low water in the lake at Geneva, N.Y., has brought to light two mineral springs containing sulphur and iron. One of the springs is very cold, and the water is excellent for drinking.....Judge Burton, of Iowa, granted an injunction against the Missouri, Iowa and Nebraska Railroad Company issuing any more bonds for the extension of their road. This will block the extension of the line until January 1, 1881, as in any event the injunction cannot be removed before that time..... Mrs. Laura de Force Gordon, the first woman lawyer who ever addressed a jury in California, defended, a week ago, a man charged with killing another man. Mrs. Gordon appeared in a black silk dress, and her only ornament was a rose at her throat. Her appearance caused a sensation which she endeavored to ignore, and she was several times applauded, to the disgust of the court. Her client was acquitted on a technical point..... A boy appeared on the street at Shreveport, La., the other day having a basket which contained over two dozen alligator eggs, which he found in a nest on Cross lake, and which he was retailing at ten cents each. Several of the eggs were broken, when it was discovered they all contained embryo alligators, which led some of the purchasers to bury their eggs in mud and sand, as it is the fashion of that animal, with the hope of hatching out a brood of alligators.

A party of thirty-five men from South Boston have settled in Wheeler county, Nebraska, and named their village Boston. They have purchased 7,000 acres of good timber and village land, and are reported to be well established. Their wives and families will join them this Fall..... Women are rapidly taking high places in the practice of medicine. Dr. Alice Bennett is in full charge of the women's department in the Eastern Pennsylvania hospital; Dr. Mary Cleaves is superintendent of the women's department of the Harrisburg asylum; Dr. Jennie McCowan is assistant physician in the Mount Pleasant (Iowa) hospital; Dr. Julia Carey, assistant physician of the Danvers (Massachusetts) hospital; Dr Eliza Phelps is at the new Iowa asylum; Dr. Helen Bissell, at Kalamazoo, Mich.; and Dr. Emma Randall, at Pontiac, Mich.....There is an immense spring on the West Dolores, about six miles from Rico, Col., just across from the head of Horse Gulch, and near the base of Calico Peak, that has an ebb and flow that is quite singular. The basin is about twenty-five feet in diameter, and in the morning is always full of water, but in the evening it is perfectly dry and empty. The water is cold and apparently of good quality, and the basin gradually fills to overflowing when it as slowly recedes, effervescing violently all the time. The discovery was made by a prospector who passed it in the morning when full (the basin was full, we mean), and on returning at night it was empty. He watched it with the result mentioned above.....Captain Eads has been making a tour of inspection through the valley of the Upper Sacramento and its tributaries so as to be able to give the authorities of Sacramento the benefit of his advice on the subject of flood-water *debris* and levees.

It is evident that a large portion of our city people suffer from diseases of the liver, bowels, or kidneys. Kidney-Wort is nature's remedy for them all.

Those that have used Kidney-Wort agree that it is the best remedy known for the kidneys and liver.

Read of, procure and use Hop Bitters, and you will be strong, healthy and happy.

Health, hope and happiness are restored by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all those diseases from which women suffer so much. Send to Mrs. Lydia E. Pinkham, No. 233 Wetern Avenue, Lynn, Mass., for pamphlets. For sale by all druggists.

Burnett's Flavoring Extracts.—There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach. BURNETT'S EXTRACTS are prepared from fruits of the best quality, and are highly concentrated. The "Fifth Avenue," "Continental," "Grand Pacific," and other leading Hotels use and endorse BURNETT'S EXTRACTS.

UNIMPEACHABLE TESTIMONY.

In Which Three-fifths of the People are Interested.

Genuineness, Reliability, Responsibility.

No Matter What Other Plan has Failed, This has Stood the Test of Time.

For Dr. Sykes has a Record of Ten Years, and that Record Stands Unparalleled.

Read What the People Say of

"DR. SYKES' SURE CURE FOR CATARRH."

C. P. TEMPLE, Coulterville, Pa., June 7, 1877, says: "I have used four packages of your remedy, and believe it is the only medicine in the market that is just what it is recommended to be—'A Sure Cure.'"

W. VILDA, Wilbur, Saline Co., Neb., April 9, '77, says: "'Your 'Sure Cure' is all you claim for it."

E. A. CHILDS, Wrightstown, Wis., Dec. 23, 1879, says: "I thank the Lord I saw your advertisement. I was badly off with Catarrh, that had been dropping down on my lungs about a year. Your 'Sure Cure' arrested its course in about three days; it has far exceeded my expectation. I recommend it to all who are suffering with Catarrh or Lung Complaints. You can use this as a testimonial, for I can say your 'Sure Cure' is rightly named, if a person only follows the directions.

MR. A. BURTON, 230 West Huron St., Chicago, May 17, '77, reported the cure of his son, a young man, by six bottles; he bought six for himself and I received information by one of his neighbors, who also became a patient, that they had cured the father also.

W. G. JEAN, Portland, Oregon, Feb. 10, 1879, reports a complete cure for Catarrh of twelve years, and says: "There is nothing on this coast the equal of your Catarrh Remedy. Before I used your 'Sure Cure' my nerves were so shattered I could not write any." His letter now shows a bold, even, steady hand.

THOS. HOME, Richmond, Utah Ter., Jan. 22, 1880, says: "My brother who was cured by your 'Sure Cure' sends his best regards, and is thankful that such a man as you lives upon earth. He says he thinks that such men are inspired by the Almighty as instruments in His hands in doing good to suffering humanity."

ALPHEUS ENGEL, Metamora, Ill.: "The three bottles of your 'Sure Cure' have done me more good than all the doctors and other medicine I ever tried, and I feel like a new man. I have a brother that used one bottle, and it helped him so much that he thinks he is cured."

MRS. E. C. BRAINERD, Spring Green, Wis., "I have used the bottle of 'Sure Cure,' and am thankful to report favorably. My lungs feel stronger and do not pain me so much. The discharges from my head are not so bad, and my limbs are not so badly swollen. I was so weak I could hardly get about, but am getting stronger every day, and I have great faith, with God's blessing, in a cure. I like your Insufflator very much."

MRS. M. A. BAIRD, Junction, Va., after using but one Package of "Sure Cure" and ordering more, Oct., 25, 1879, says: "The 'Package' I have used did me a great amount of good. My head felt very badly from such a roaring that I could scarcely hear any ordinary conversation, but it is now so much better that I seldom need ask to be told again."

REV. R. S. MARTIN, Crown Point, formerly of Hebron, Ind., Feb. 6th, '80, says: "Your 'Sure Cure' is the best remedy I have ever found for Catarrh, and quite a number of persons have used it with success on my recommendation."

REV. A. W. JEWETT of Joliet, Ill., Jan. 24, 1880, made the following verbal report: "Although I now find that I have used it very imperfectly, I never tried anything before that did anywhere near the good your 'Sure Cure' has done."

L. E. MITCHELL, Juniata, Adams Co., Neb., Feb. 24, 1880.—"I write to thank you for the wonderful cure you have wrought on my wife by your unequaled medicines. The case was so severe that I am not capable to describe it, and we cannot find words to express our gratitude, for we know you have saved her from a terrible death that must have come soon, if we had not providentially heard of you. In July, 1878 her throat and mouth were attacked with a terrible sore, and a large bone came out and left a hole as large as a silver dollar in the roof of her mouth, through into her nose; it then ate very fast clear up through her nose—or so nearly through the doctor lanced it, and more than once, but could not afterwards heal it. Her pain and sufferings were awful—no sleep or rest; nothing but misery and the sore fast spreading. We employed doctor after doctor, but none of them could give but temporary relief, and some of them seemed to make it eat away faster by the burning medicines they used. They called it a cancer, and, finally, after it had eaten more than half of her nose off, the doctor who had attended her for about a year called a council of physicians, and they decided it to be a cancer, and said the treatment she was taking was all right, and that all had been done that could be done. They said the eating could not be stopped, and it would certainly kill her in less than three months, and there was no cure for her; so we accepted it as the will of God that she must die.

Her desire to see her father, brother, and other relations in Jackson, Mich., before she died, was so great that I bid her 'good-by' never expecting to see her again, and she sat out on her sad journey. Before reaching Chicago a kind-hearted minister, the Rev. M. L. Vorheis, of Burlington, Iowa, on the same train, learned the particulars of her case, and insisted upon it that Dr. Sykes, of Chicago, could cure her, and that she must stop and see you; he also told her of a wonderful cure wrought by you on a Mrs. Henry Avery, of Burlington, Iowa, of a cancer in the throat. As it was too late in the evening on her arrival to see you and she had not time in the morning before the first train, she hurried on and then wrote you from Jackson. Your answer was prompt, but not at all encouraging; but after reading some of your cures of what you call 'Cancerous Catarrh,' she and her brother started at once to see you. I wish you would describe how she was when you first saw her. But I want to tell the world that in a little over ten weeks from the time my wife left home I went to meet her at the depot, and she had changed so much in her looks, that I passed right by her, and did not recognise her till I heard her happy voice. Her nose was all healed up, and she looked so well and happy, and she weighed 25 pounds heavier than when she left home. All our neighbors looked upon her wonderful cure as a miracle; she is now a stout and healthy woman, and is doing the work of our large family, a well and happy woman. We cannot express our feelings towards Dr. Sykes as we would like: we are overjoyed, and can only say, "God bless you, Dr. Sykes."

I saw Mrs. (Nancy) Mitchell on the 9th of October, 1879; her brother, A. S. Wing, of Jackson, Mich., was with her, and can vouch for the description I will here endeavor to give. First, when the cloths were removed from her face, she was an awful sight to behold. Her nose was entirely eaten off from the ridge in line with the eyebrows down on the right side to the eye, and to the cheek in a circular form, coming out within half an inch of the end of the nose; the flesh and bones were all gone on that side; and were eaten down fully one-third of her nose on the other side. Her cheeks and eyes were badly swollen and inflamed, lancinating pains all through the sore, and severe pains all through the head. The nostrils were equally as raw as the external sore, and the quantity of matter discharged was estimated at about half a teacupful daily, the cavity was open clear through into her mouth. She had but little appetite, and said she had not had a good night's sleep in over a year. I saw her every day for two weeks, treated the sore with a mucilaginous preparation, then with what I call a cancer powder, used an ointment, the 'Sure Cure' and 'Specific Blood Medicine.' During these two weeks Mrs. Mitchell boarded with Mrs. L. Andrews, at 221 West Lake Street, and she can also vouch for the case and cure. I never saw a sore heal so rapidly as this, or a patient gain faster; in two weeks she returned again to her father and brother in Michigan, taking medicines with her, where she stayed eight weeks, the nose healing up sound within that time. She returned to Chicago Saturday, December 20, put a notice in Sunday's Tribune and Times of the 21st, announcing her cure and asking interested people to call and see her at my office from 2 till 4 p. m., Monday, (and about thirty called), and she started for her Nebraska home next day, saying she was the happiest woman on earth.

The Rev. W. J. Chaplin, of Dowagiac, Mich., happened to ride in the seat with her to Chicago, and gives me the privilege of referring to him in proof of the cure. Prof. Henry Olin, of Bennett Medical College, office corner of Madison and State Streets, saw her that Monday morning, and speaks of the cure as one of the greatest he ever saw. I have Mrs. Mitchell's photo in my office, taken on that Monday after her cure, and notwithstanding she is badly scarred, the deformity was not so great as a person would naturally suppose. Let me also add that previous to coming to me her treatment had all been of the cauterizing type, carbolic acid being about the mildest of any, and she was using this daily until the blood would gush from the gaping sore. Nearly all of this kind of cases I get have also been treated by this barbarous mode. Will not my fellow physicians learn a lesson from these cases and let their patients live?

The above are but samples of what the remedies have accomplished. Price of the "Sure Cure" and "Insufflator," all complete, is only **$1.50**. Book of full information, ten cents, well worth a dollar. Name the Rural New-Yorker in writing, and address

DR. C. R. SYKES,

169 Madison St., Chicago, Ill.

Rupture

DR. J. A. SHERMAN—AND THE ONLY DR. SHERMAN known to the public for the past 35 years or more for his successful method of treating Rupture without the annoyance and injury trusses inflict, may now be consulted weekly at the New York and Boston offices. Dr. Sherman is the discoverer of the only known cure for Rupture by local external treatment.

No man is safe who has a Rupture, no matter how insignificant he may consider it, for every man who has died from it, once flattered himself that it was but a trifling ailment; and every man who now suffers from it and the injury of trusses, to such an extent that life has no enjoyments, once regarded it as unworthy special attention. It is not a stand-still affliction; it is steadily progressive, even unto death, and he is wise who takes the necessary steps to be relieved of it before the day of suffering and gloom comes upon him.

Patients from abroad can receive treatment and leave for home same day. During treatment any kind of active exercise or labor can be performed without interfering with the treatment, and with safety from the dangers of strangulated Rupture. **HIS BOOK ON RUPTURE** gives the most reliable proofs from distinguished professional gentlemen, clergymen, and merchants of his successful practice and popularity therefrom throughout this country and the West Indies. The afflicted should read it and inform themselves.

It is illustrated with photographic likenesses of extremely bad cases before and after cure, and mailed to those who send ten cents. In consequence of the great demand for Dr. Sherman's personal services, he will, till further notice, divide his time between New York and Boston offices as follows: Saturday, Monday and Tuesday he may be consulted at his New-York office, and Wednesday, Thursday and Friday at his Boston office each week. Remember, in writing or calling, the address is

DR. J. A. SHERMAN,

251 Broadway, New York, and 43 Milk St., Boston, Mass.

KIDNEY-WORT

The Only Medicine

That Acts at the Same Time on

The Liver, the Bowels and the Kidneys.

These great organs are the natural cleansers of the system. If they work well, health will be perfect; if they become clogged, dreadful diseases are sure to follow with

TERRIBLE SUFFERING.

Biliousness, Headache, Dyspepsia, Jaundice, Constipation and Piles, or Kidney Complaints, Gravel, Diabetes, or Rheumatic Pains and Aches,

are developed because the blood is poisoned with the humors that should have been expelled naturally.

KIDNEY-WORT

will restore the healthy action and all these destroying evils will be banished; neglect them and you will live but to suffer.

Thousands have been cured. Try it and you will add one more to the number. Take it and health will once more gladden your heart.

Why Suffer longer from the torment of an Aching back? Why bear such distress from Constipation and Piles?

KIDNEY-WORT will cure you. Try a package at once and be satisfied.

It is a dry vegetable compound and

One Package makes six quarts of Medicine.

Your Druggist has it, or will get it for you. Insist upon having it. Price, $1.00.

Farmers' Report on Clover Hullers

LAGRANGE, Lagrange Co., Ind., May 27, 1880.

Report of a Joint Committee appointed by the Agricultural Societies of St. Joseph County, Michigan, and LaGrange County, Indiana, to test the relative merits of the VICTOR CLOVER HULLER, OF HAGERSTOWN, MARYLAND, and of the BIRDSALL MONITOR, JUNIOR, CLOVER HULLER, OF SOUTH BEND, INDIANA:

WHEREAS, at the St. Joseph County, Michigan, Fair, held at Centreville, on the 21st day of May, 1880, an agreement was entered into by the representatives of the different machines to have a trial of their merits at the LaGrange County Fair, on Thursday, May 27, a Joint Committee was formed, consisting of five from each of the two counties, and held such trial this day.

The Committee, in pursuance of the agreement, secured two two-horse loads of clover, which had been stacked two winters, and brought them on the grounds, and determined that each machine should thresh one load, and then each RE-THRESH the straw which had been run through the other machine according to agreement.

At the conclusion of the trial the Committee repaired to Agricultural Hall, and, after due deliberation, unanimously decided in favor of the **Victor for rapidity and excellence of work in all respects.**

The Birdsell, from 1,339 pounds straw, threshed 37 pounds seed mixed with a larger quantity of chaff; the Victor, from 1,310 pounds straw, threshed 48¾ pounds seed mixed with a less quantity of chaff. The time occupied in threshing by the Victor was eight minutes less than that occupied by the Birdsell. From the straw of the Victor the Birdsell machine re-threshed two pounds seed; from the straw of the Birdsell the Victor re-threshed eight pounds of seed. The time occupied by the Victor in this re-threshing was seven minutes less than that occupied by the Birdsell.

These machines were both run by a Russell engine, from Massilon, Ohio, in charge of John F. Fallon; used essentially the same amount of power.

Signed by Committee,
E. SIXBY, Chairman, Lagrange, Ind.

BRIEFLETS.

Of the early grapes, Moore's Early, Talman or Early Champion, Hartford Prolific, Telegraph or Christine, and Ives, J. T. Lovett writes us that he regards Moore's Early as the best for market, and Telegraph as the best table grape for home use. Moore's Early is the earliest of all by a few days, very like Concord in every respect—fully equaling it in size of bunch and berry, fine appearance and quality. It cracks also about as badly. Telegraph is still better in quality, but has a skin so thin that it will not bear shipment so well and is a few days later than Moore's Early. . . . . We wish it were the law that every railroad company in the country were compelled to lay a double track. Most of the collisions which occur are caused by the misunderstanding and confusion which are almost unavoidable where single tracks alone exist and a heavy business is carried on. . . . . We were speaking some time ago of a cucumber grown by Mr. Stewart 30 inches in length. A cucumber was exhibited at a recent English show measuring 39 inches in length and 12½ in circumference, weighing 10½ pounds.

"WHAT will cure or relieve catarrh?" is a question which has been frequently asked us, and which we have answered to the best of our knowledge in these pages. In this connection we desire to call particular attention to the advertisement, in this issue, of Dr. Sykes's Sure Cure for Catarrh. Besides the numerous indorsements of its merits specified in the advertisement, we have it from thoroughly trustworthy private sources that it is working some wonderful cures of this disagreeable, persistent and dangerous ailment; so that we strongly advise all whose happiness is marred by it, to give this cure a trial.

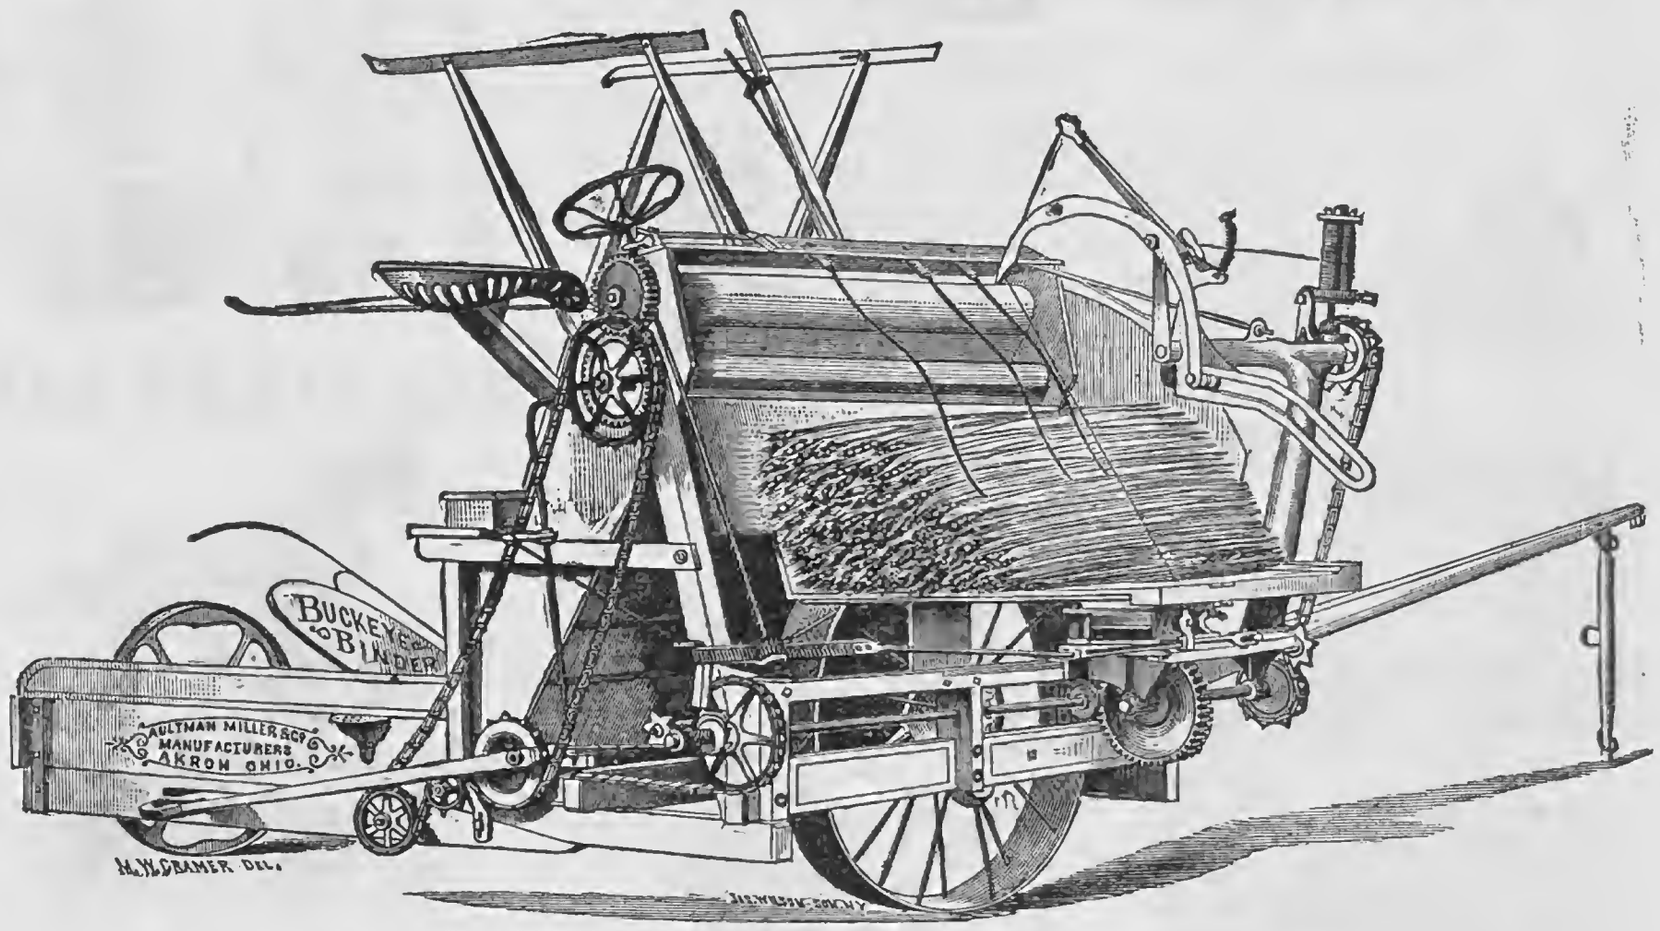
Buckeye Self-Binding Harvester.



THE BUCKEYE BINDER WAS AWARDED THE FIRST PRIZE GRAND GOLD MEDAL, AT BUCHAREST, ROUMANIA, JULY 19th, 1880.

THE FIRST PRIZE AND GRAND GOLD MEDAL Offered by the Agricultural Society of France, awarded to the Buckeye at Society's Field Trial at Rambouillet, near Paris, June 22, 1879.

THE FIRST PRIZE AND GRAND GOLD MEDAL Offered by the Agricultural Society of Spain, awarded to the Buckeye, at the Society's Field Trial at Madrid, Spain, 8th to 13th of July, 1879.

FIRST PRIZE AND DIPLOMA OF HONOR, Awarded to the Buckeye at Sable d'Olonne, France, July 13th, 1879.

FIRST PRIZE AND SILVER MEDAL, Awarded to the Buckeye at Laincourt, France, July 20th, 1879.

The McCormick Binder was a competitor in all the above-named Trials, and the Osborne and Wood Binders at most of them.

The BUCKEYE is, so far as we know, the only Binder which has the simple crank movement for the needle, allowing a stationary arm of cast-iron, tubular in form, to be brought close to the work to be done, giving a perfectly rigid support to the needle itself, and securing for it greater steadiness of motion than is possible in any other form.

The driver, without leaving his seat, can instantly move the binding apparatus forward or back, to suit long or short straw. Bundles are delivered regularly at intervals of nine or eleven feet, or the size of the gavel may be regulated as desired by the driver, by means of a foot lever, and large or small bundles are bound without any change of the adjustment.

When properly adjusted, the Buckeye will bind its bundles as tight as can be desired, the limit being not the capacity of the machine, but the strength of the wire.

The objections to wire as a material for binding are without any foundation in fact. All wire bands can be removed from the straw by means of the shears we furnish with the Buckeye. Even if they do get into the threshing machine, they do not injure it, nor is there any danger of injury to cattle. Neither do millers and wheat buyers pay less for wheat bound with wire, as every particle of wire can be removed through the use of magnets. These points have been thoroughly discussed, and not one of the objections against the use of wire has yet been sustained.

All our Reaping Machines, Table-Rakes, Droppers, Harvesters and Self-Binders, are provided with reels of the most approved pattern, which can be adjusted to the desired height by the driver while the machine is in motion. The operation of the adjustable reel on the Binder will be found extremely satisfactory in the field, as a wide range of movement up and down and forward and back has been provided.

WE ALSO BUILD THE CELEBRATED

BUCKEYE MOWER, BUCKEYE DROPPER AND BUCKEYE TABLE-RAKE.

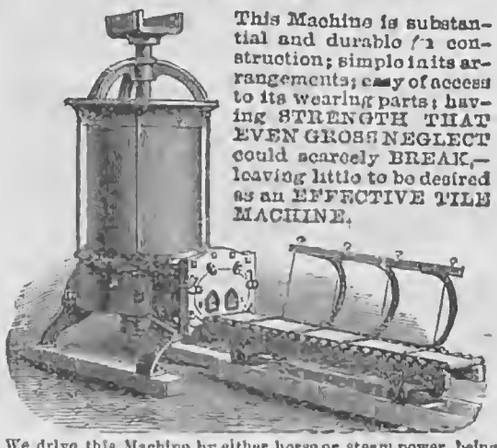
BRIEFLETS.

A question which might be profitably discussed by our farmers' clubs and societies is: "How to elevate the character of our agricultural fairs so as to attract the young—so as to instruct both the old and the young in all that pertains to the farm, garden and orchard."..... The first thought of secretaries and directors is "How to make them pay?" Gambling, side-shows, and all sorts of clap-traps disguised under specious names which attract the thoughtless, are therefore tolerated—even encouraged.....But the impolicy of this course is rapidly becoming apparent. Respectable families hesitate either to permit their sons and daughters to attend the fair or to go themselves. .....The aim of the agricultural fair *must be* changed. Exhibitions of the highest merit must be striven for The general plan and scope of our Centennial Exhibition must be imitated, and again, as in times of old, the intelligent farmer and citizen will lend his full countenance and support.....As Mr. James Vick well expresses it: "It is well to improve our fowls and sheep and horses, and plows and harrows and wagons, but there is no improvement so much needed, none so important to the welfare and glory of our country, as the improvement of boys and girls and men and women. And, no matter what a society may do for the improvement of animals and implements and grain, if it depraves the people it is a curse and not a blessing."....As we understand it, the prime object of fairs is to teach those who visit them. We do not understand that the prime object of fairs is to advertise exhibitors. There is evidently a misunderstanding between the two classes. .....It is a point often disputed whether the tops of asparagus should be cut before or not until after the seed has ripened. Mr. J. T. Lovett writes us that it is positively to the detriment of asparagus to cut down the tops before they have performed their entire mission and thoroughly ripened, and this he has learned by experience.... Mr. A. B. Allen thinks our cut of Vidocq one of the best and most perfect specimens of a true Percheron ever engraved.....It will be observed that some parts of the Rural Farm on our first page are marked M., M., M. Mr. Mead, who kindly favors us in this number with the impressions of his visit to the farm itself, asked if those letters in the engraving stood for mosquitoes?..... In consideration of the universal need of general-utility horses, is it too much to ask our agricultural societies to offer higher prizes for them and lower prizes for the race-horse, with which, as such, the farmer has little or nothing to do?.....Alexander Hyde says that the isolated life which the farmer leads tends to make him a man of one idea, and it will do him good if, after he has given one day to the exhibition of stock and crops at the fair, he gives another to the exhibit which the men and women make of themselves.....There is no way by which we can so well forget ourselves and the little botherations incident to life, as by mingling with others and seeing and hearing their trials.....As our own pumpkins seem the largest till we see some larger, so our cares and vexations are wont to loom up in a magnified form till we learn how much larger afflictions others are suffering..... Intelligent observation at the fairs will induce all enterprising farmers to endeavor to work out improvements upon their own farms.....Authorities at fairs have no business to hold such positions unless in the face of much provocation to become peevish, they can command a polite manner and take pains to answer explicitly a thousand trivial questions put to them by visitors.

Oh, why will you let that invalid friend suffer, that Hop Bitters will so certainly cure.

Eureka Drain Tile Machine



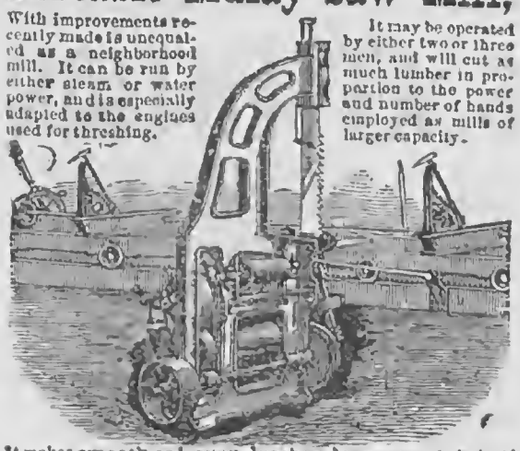
This Machine is substantial and durable in construction; simple in its arrangements; easy of access to its wearing parts; having STRENGTH THAT EVEN GROSS NEGLECT could scarcely BREAK,—leaving little to be desired as an EFFECTIVE TILE MACHINE.

We drive this Machine by either horse or steam power, being well suited to either. Our Tile dies range in size from 3 to 9 ins. in diameter; and in shape we vary them to suit the taste of customers. As a Brick Machine it is also a complete success. It is fully warranted as a Tile or Brick Machine. Send for circular.
CHANDLER & TAYLOR, Indianapolis, Ind.

Portable Mulay Saw Mill,

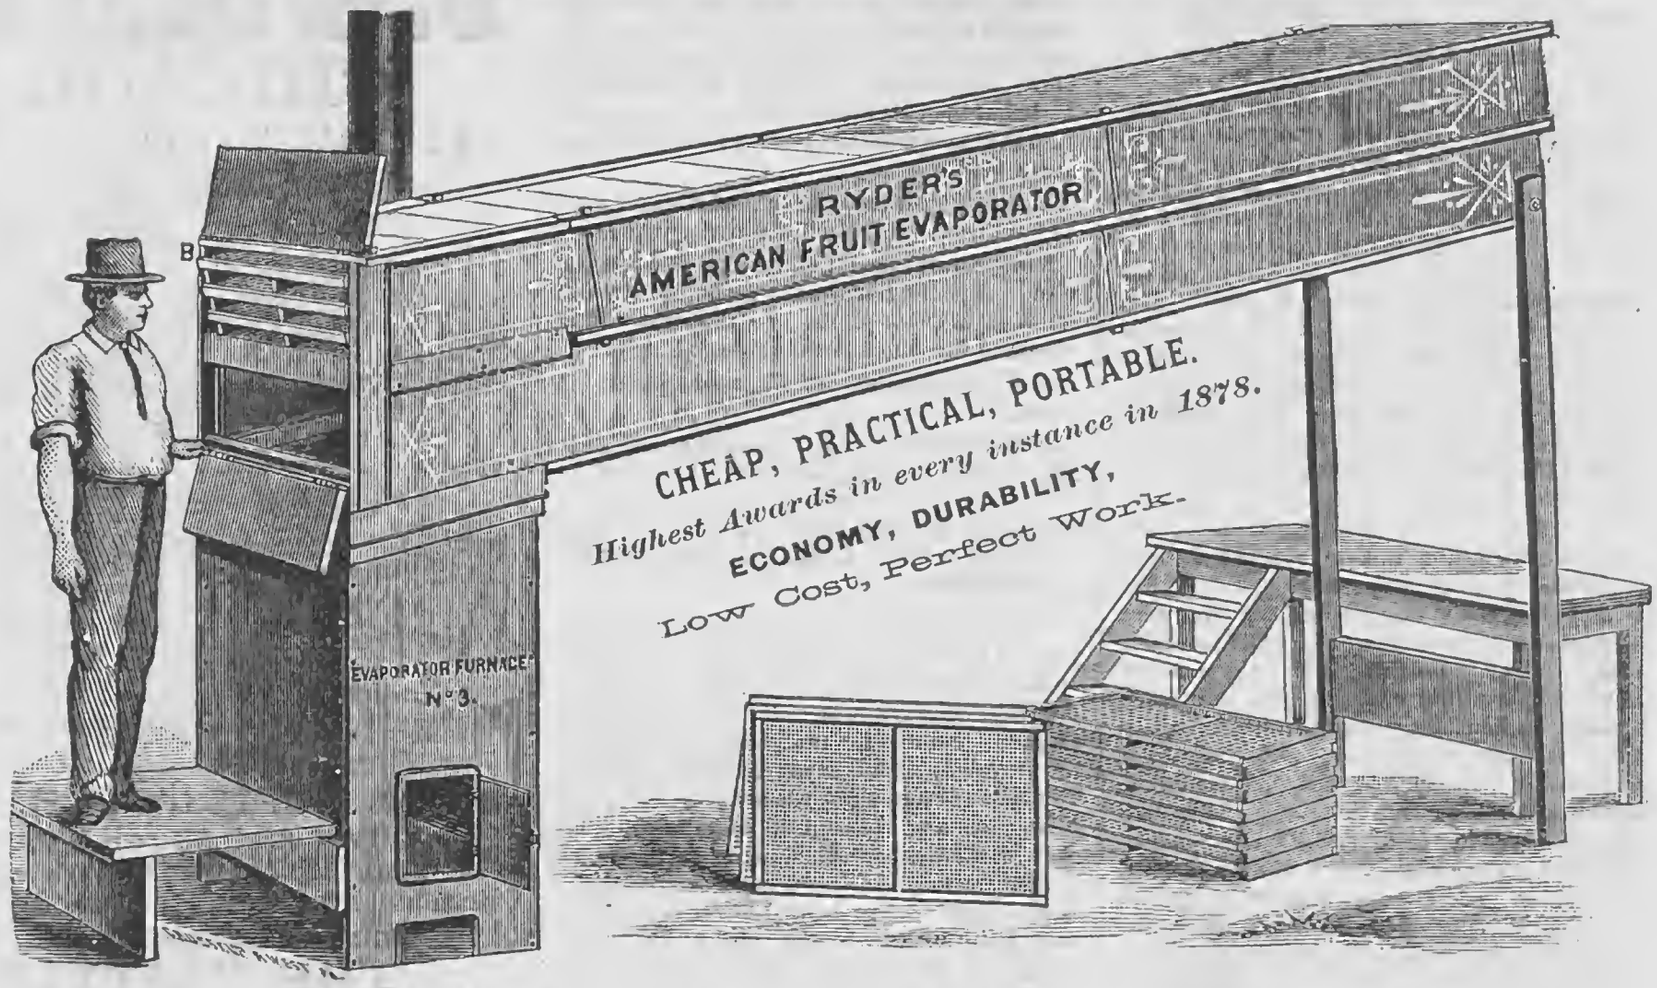
With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power, and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stub shot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

The American Fruit Drier.



CORRECT PRINCIPLES, CORRECTLY APPLIED.

Its product in color, flavor and selling qualities unexcelled. Original and radically new in fruit evaporation.

Some of the merits of the AMERICAN, and advantages secured by its patrons:

1st. We enumerate among other claims of the American Evaporator, certain advantages secured by purchasers, in addition to its acknowleged structural superiority. They have in our Fruit-Selling Department a comprehensive co-operative agency with mutual interests, in the sale of their product. Thorough uniformity of quality, value, package, trade mark and label, secured by our confidential circular to purchasers, and carefully selected selling agents.

2d. That all our Evaporated Fruit is made by our patrons, and in securing best possible prices for them, we best advertise our evaporator, maintain the established reputation and price of its product, at small cost. We do not desire to make any considerable profit on your labor.

3d. It is the only original Inclined-Flue Evaporator, thoroughly protected by letters patent, and the only one which can guarantee protection and safety in its use against costly litigation, royalties and damages. See notice in catalogue of our claims.

4th. With it the individual farmer and orchardist can cheaply convert his surplus fruit into evaporated stock, equal in appearance and market value to that produced by the most thoroughly equipped and expensive commercial evaporator.

5th. No farm implement will pay its cost so quickly, or so many times in a season; always ready, the daily wasting fruit suggesting its use and reminding us "It is not what we make, but what we save that accumulates wealth."

6th. Owing to the universal practice of sun and oven drying of fruit, the market for that kind is overstocked and it does not pay, while choice evaporated fruits always command good prices.

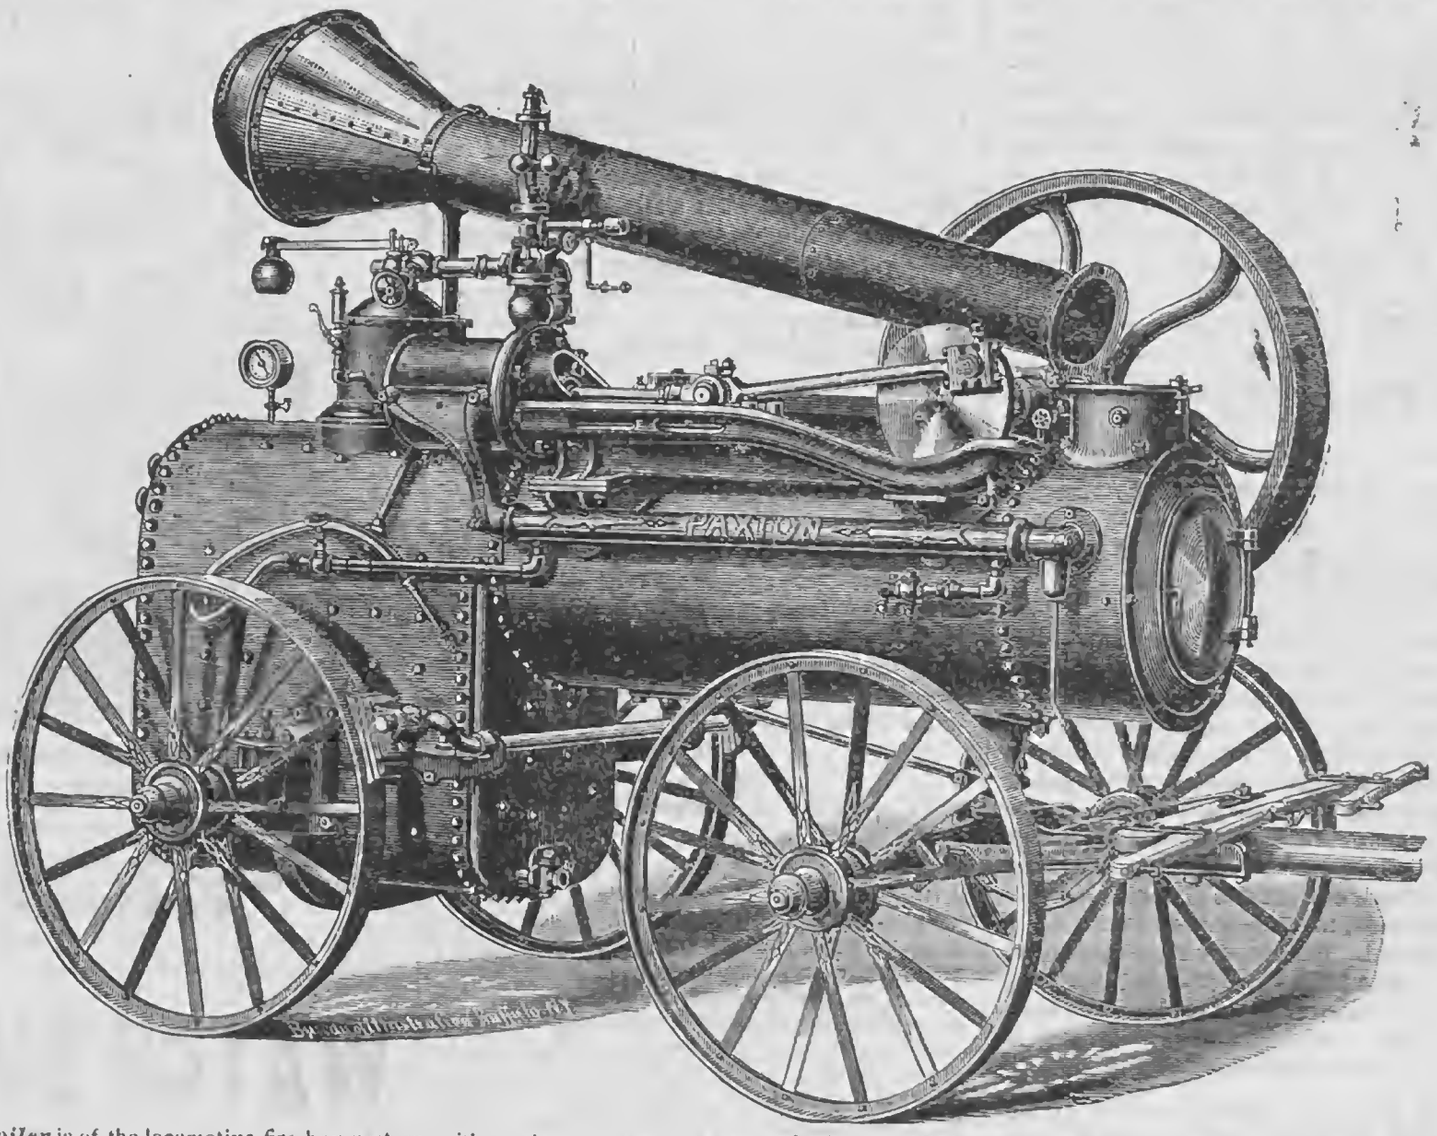
7th. Strong currents of Dry Hot Air, automatically created, pass so rapidly through the *Inclined Flues*, precluding the possibility of discoloration, and account for the fancy work it does.

8th. Each tray (or group) first receives the direct and greatest heat. 2d. Each subsequent tray (or group) takes its place, and puts former one out of danger. 3d. It is almost impossible to burn the fruit in continuous working.

9th. Its evaporating capacity per tray surface and for its cost is unequaled. 2d. It will produce a handsomer, brighter-colored and a more valuable product than any other portable evaporator. Illustrated Catalogue free.

AMERICAN DRIER CO., Chambersburg, Pa., U.S.A.

PAXTON PORTABLE ENGINE



The Boiler is of the locomotive-fire-box pattern, with continuous water space around ash pan. We invert the back head of fire box and dispense with the cast-iron back, making that part of boiler available heating surface, and suffer less radiation of heat, an advantage in point of economy as well as to the engineer. The boiler is made of best American plate, well braced and of ample capacity.

The Engine is attached to one side of boiler, with fly-wheel opposite, which makes centre of gravity in a line central with boiler, also reducing hight of machine, making it less top-heavy and bringing it within reach of the operator.

The Connecting Rod is of finished steel with brass boxes of the finest metal that can be produced. ***The Cylinder*** is steam jacketed.

The Crank Shaft is made of steel, also all connecting pins are made of steel, hardened and ground on centres by a special machine. Piston rod and valve rod are also made of steel.

The Pump is attached to boiler on opposite side of engine, and is operated by a separate eccentric, and has a hand attachment to fill boiler by hand when not fired up. The boiler and engine ride on springs forward and back, relieving it from injurious strains in transportation. ***The Wheels*** are of iron and imperishable. With a superior ***spark arrester*** in connection with water space around fire box, we obviate every possibility for the escape of fire—fire doors, ash pit, and smoke box doors are perfectly tight. We also place a ***fusible safety plug*** in crown sheet of fire box. In fact it has been our design to secure the desired result in the most direct and simple manner that an extended experience could suggest as being consistent with economy of fuel and stability of parts, sparing no efforts to make it complete in all its appointments, at the same time avoiding all complex "novelties," (so-called improvements,) features which are not essential to its economic action, but liable to wear and derangement—the great source of annoyance to the inexperienced engineer. ***For Circulars address***

FOUNDRY AND MACHINERY DEPARTMENT,
HARRISBURG CAR MANUFACTURING CO., Harrisburg, Pa., U.S.A.

☞Also manufacturers of the celebrated ***Paxton Drill,*** with or without broadcast shovels, ***Phosphate Corn Planters,*** Streiwig's patent, etc., etc.

Miscellaneous.

BRIEFLETS.

O. JUDD "has been appointed an Indian commissioner." This was a surprise to "O. J." He accepts it, however, believing that it presents a much wider and more congenial field of usefulness than he has heretofore occupied. . . . . "'Tis the last rose of Summer," is what the sun said when he got up on the thirty-first of August.—Boston Courier. . . . . After suitable soil, we do not believe there is anything that better insures the health of fruit trees; that more effectually prevents blight, borers, yellows, etc., than washing them twice or thrice from April till October with a mixture of lime, potash, hellebore, aloes, salt, carbolic acid, etc. Lime and any one or all of the others may be used. . . . . Mr. Page of London thinks that Cos Lettuce is the only kind fit to be eaten. . . . . Extremes Meet.—A young girl and her lover were accustomed to meet on an unfrequented half-mile, circular race-course. When questioned as to the reason for choosing this particular locality, she blushingly replied, "Oh, sometimes we are interrupted; and then John walks off in one direction and I in the other, and meet on the opposite side. . . . . There are many reasons why it is well to raise peaches from pits. The seedlings will usually bear in three years. There is a very good chance of the seedlings coming true to seed. They are very easily raised. As soon as the pits are saved, they should be buried. Then in the Spring plant the pits where the trees are to grow and fruit. . . . . Because General Hancock doesn't sit on a dry-goods box in front of corner groceries and tell the neighbors how to save the nation, some country editors speak of him contemptuously as "no statesman."—Cincinnati Saturday Night. . . . . Clara Louise Kellogg has declared for Hancock.

"When music, heavenly maid, was young,
Ere yet in early Greece she sung."

Oh, Clara Louise! Oh! Where are now the hopes we cherished? Thou has learned to love another. Ah, false one, vote for Garfield and Arthur.—N. Y. Commercial Advertiser. . .

Mr. A. B. Crandell remarks: The sentiment against horse-racing at agricultural fairs is gaining strength year after year, as the immediate harm and evil tendencies of the system are more clearly seen. It is a rare instance now to find any farmers' journal defending it, but nearly all unite in saying that unless these exhibitions can be maintained without help of the fast element, 'and all that that implies,' they had better be abandoned." . . . . . Readers, begin thus early to form your plans for another year. Study how you may improve your crops by a change of seed—by selecting new kinds, or varieties different from those you have been sowing. Pray do not jump at the conclusion that your kind of corn or wheat or oats is the best that can be obtained. We have often thought so and found ourselves, by experiments, vastly mistaken. Prepare for future work, and to make that work more profitable to you and to your family with the same expenditure of time and labor.

ANSWERS TO CORRESPONDENTS.

Oak Tan Bark Ashes as a Fertilizer.

J. W. H., Williamsport, Pa., asks whether the ashes of oak tan bark would be a good fertilizer to drill in with wheat; and, if so, what quantity can be used per acre.

ANS.—The potash contained in fresh unleached ashes is caustic and there is no more destructive substance to tender vegetables, or, in fact, to any organic matter, such as a young sprout from a seed, than caustic potash. Although the strength of the potash in this respect depends upon its freshness, yet unleached ashes are at any time dangerous to use near the seed. It would therefore be safe to spread the ashes, any quantity up to 50 bushels per acre, broadcast, and then drill the seed, or, if sown broadcast, to harrow both in together. This would mix the ashes with the soil so as to render them innoxious. The only safe fertilizers to be drilled with the seed are fine bone dust and the best grades of superphosphate that are free from free sulphuric acid.

E. I. H. Easter Pa., referring to the RURAL experiments with seeds, asks which are the best and most productive varieties of wheat, corn and potatoes. He has just thrashed wheat that yielded 40¼ bushels per acre.

ANS.—We should like to know the variety of wheat which yielded you 40¼ bushels per acre. The results of our wheat experiments are in part described in this week's RURAL. Fultz and Clawson are generally recognized as our most productive kinds. We shall this Fall sow over 100 kinds on trial, while we shall depend chiefly on Fultz and Shumaker, for our main crop. The results of our experiments are given in full in these columns from time to time. We shall report our potato tests in a few weeks. Blount's corn promises the best yield we have ever had. In fact, it *seems* to be the greatest yield we have any knowledge of under ordinary cultivation. This also we shall report as soon as the yield can be measured. Chester Co., Mammoth has also done well; but the ears are so heavy and carried so high that many stalks break in two under their heavy load.

T. T. S., Tylersville, Conn., asks where seed of the Eucalyptus globulus can be obtained.

ANS.—Thorburn & Co., of this city sell the seeds. But the Eucalyptus globulus will not stand 25 deg. above zero, so that they could not stand the climate of the above latitude.

S. K., Coopertown, N. Y., sends plant for name.

ANS.—This is Plantago lanceolata—the English Plantain or Rib-grass.

CHANGE IN FEEDING SWINE AT THE WEST—HOG CHOLERA AND OTHER DISEASES.

IT has been too much the practice heretofore at the West to keep swine in large numbers in small, filthy, muddy fields or yards, destitute of pure water and fed exclusively on corn. No wonder that hog cholera should be prevalent under such circumstances, and thousands die annually in consequence of them. Now, we are rejoiced to observe a great change is rapidly taking place in the treatment of swine. They are given ample grass pastures and clover fields for range in Summer, and partially fed on wheat bran, middlings, or oatmeal well thinned with pure water and slightly salted, together with a small quantity of flaxseed or oil-meal, and an occasional dose of sulphur. By this method swine grow rapidly, are kept generally healthy, and are well prepared, when cool weather begins, to be fattened on corn for the Winter market. Earlier maturity and a greater growth and weight of flesh are obtained by this changed method of feeding and ample range, and the pork and bacon are found of a superior quality.

We have no doubt that trichina, measles, quinsy, lung fever, and all other diseases to which swine are now subject, may be generally avoided by a judicious method of feeding the pig from its birth till fully fattened for slaughter. A. B. A.

TERMS NOT UNDERSTOOD.

A farmer friend writes us: "The great objection that farmers have to agricultural papers is that they use terms they cannot understand."—Rural Brevities.

The farmer is right. It is a great fault in agricultural writers who have received a liberal education constantly to use technical terms without explanation. This has been one of my greatest troubles as an agricultural editor. I have often solicited a contribution from some able writer on a special subject and received a paper well adapted for reading before a scientific society, but which might as well have been written in Greek, so far as the farmers with a common school or even an English high school education are concerned. This blunder was the rock upon which the otherwise admirable Scientific Farmer split and sank. In preparing such contributions for the printer I have made it a duty to place after each "hard word," its meaning in parenthesis. I have always done this in my own writing when compelled to use a technical term, and have frequently been thanked for it by my readers. I suggest it to other writers as calculated to make their writing more useful and popular and for its educative effect. A reader even of very limited educational training who sees the meaning thus following the "hard word," soon associates the two together in his mind, and is so far led out of darkness into the light.

FREE TO ALL!

Wishing to introduce our great Literary and Family Journal, **The Fireside at Home** (a mammoth 8-page, 40-column *Illustrated* paper, size of *N. Y. Ledger*, devoted to Literature, Useful Knowledge, Amusement, and everything to delight and instruct the whole family) into thousands of new homes where it is not already taken, we will send it **Free for Three Months** to all who send **Ten Cents** (in silver or postage stamps) to pay postage and help pay the cost of this advertisement. The regular price is $1.00 per year, but we are willing to give the paper away for three months and lose its cost in order to introduce it to new readers. By taking advantage of this offer you will secure all the brilliant holiday issues and enlarged numbers soon to be published, and an amount of valuable and attractive reading matter for the approaching **Long Winter Evenings**, which could be secured in no other way for four times the amount. **Send at once**, and if you can conscientiously say, after your subscription has expired, that you have not received double the value of the ten cents—yes, and more—we will make you a present of a $1.00 bill. Address:

J. M. LUPTON, Publisher, 27 Park Place, New York.

WATCH BUYERS, ATTENTION

The celebrated Borel and Courvoisier Watches were awarded the first prize in London in '62, grand prize at Paris in '67, first prize at Centennial in Philadelphia, and lastly gold medal at Paris in '78. These watches have stood the test for the past 20 years, and pronounced by best judges equal to any made. They all have Nickel Movements, Tempered and Hardened Breguet Hair Springs. Is chronised for railroad use in Key and Stem Winders, with all modern improvements in the art of watch making. Large numbers are in use on the principal railroads in the country. As a guarantee that they are what we claim for them, we refer by permission to the dealers named below who have sold them for years:

Sabbath Reading.

A SABBATH HYMN.

SWEET day of rest! the very sound is healing—
A hush amid the conflict and the strife;
The calm of heaven is softly round us stealing,
We hear the whispers of a holier life.

Earth's misty veil that hangs so closely round us
Is gently lifted this one day in seven;
And pressing cares which in their net have bound us
Retire, and leave us transient gleams of heaven.

This day on which the Saviour rose to glory
Has left a shining radiance on its track;
Again we hear with joy "the old, old story;"
Our childhood's faith on wings of light comes back.

Oh, wherefore, wherefore should we lose the blessing,
When morn restores the round of earthly care?
Happy the souls who all in Christ possessing,
Breathe, e'en below, heaven's pure celestial air.

And we, amidst the daily path of duty,
May keep the oil still burning in our breast;
So shall the toilsome path grow bright with beauty,
And every day shall be a day of rest.—M. E. B.

POWER OF PRAYER.

God wants us to be so like himself that he never gives us a power for ourselves without granting us likewise the capability to use it for others. How different had been our case, had he made us each an isolated being, independent of all others. Priests are we unto our God. The Son of Man is the Great High Priest, the World's Intercessor. But under him is every redeemed child of man exalted to the holy office of intercessor. This world is indeed a world of woe and sin, but have we ever tried to imagine what it would be without the prayers that day and night rise from it to God's Throne? On the Sunday sometimes we realize the blessedness of the great assemblies gathered together all over the earth, pouring out like praises and like prayers. Were our inner eye clear, not on Sundays only but every day we should see bands of holy men and women united in secret supplication for the world perishing around them. Then should we understand how weakness is made strong, how cold lips are touched as with a coal from God's altar, and speak words of life. We know sorrowful hearts, can we comfort them? We know anxious, burdened lives, can we help them? "No," we are ready to say:

But, blessed be God, the help we cannot bring we can gain. Why should love's pleading be so powerful in the Saviour's ear, do we ask? Because he is himself the pleader, because with each hour of his eternal life is linked his own intercession. Reverently yet confidently may we feel it.

THE poet Longfellow tells of "Sandalphon, the angel of prayer," how

He gathers the prayers as he stands,
And they change into flowers in his hands,
Into garlands of purple and red,
And through the great city immortal
Is wafted the fragrance they shed."

The picture is but a reflection of John's vision at Patmos where the angel offers to the Lamb on the golden altar the vials odorous with "the prayers of the saints." Are we praying "evening, morning, and at noon," praying "seven times a day;" or, indeed, "without ceasing?" Then are we swelling the volume of that perfume which Jesus daily delights to receive.—Church Union.

I CANNOT but believe that there is what I can best term emotional recognition, on the part of the Eternal Father, of good or evil in his children; that, if there be joy in heaven over the penitent sinner, He, chief of all, feels that joy that you or I give to or withhold from the Supreme Being conscious satisfaction and gladness by our purity and sanctity of spirit and conduct, or by false, impure and unworthy lives. Oh, did we thus feel our son ship and bear about in our hearts our birth bonds, could there be more potent motive in the pursuit of good and avoidance of evil?—*Andrew J. Peabody.*

THERE is a way of doing good in the world, on a small scale, which is scarcely appreciated. A man who educates one child faithfully may effect a work of greater benevolence than one who has won the name of a philanthropist. The love concentrated on a family may produce greater fruits than that which embraces the world. Its action is more intense and invisible, but its results may go abroad and leaven the whole mass of a community.

GOD'S agency does not exclude nor supersede our instrumentality. He gives the increase, but Paul must plant and Apollo water. He furnishes the wind, but we are to spread the sails. He gives, but we gather. Prayers and diligence, dependence and activity, harmonize in the Scripture, and are only inconsistent in the crudeness of ignorant and foolish men.—*Wm. Jay.*

GRATITUDE.—God has given us a great many blessings—more than we can count. Yet how natural it is for us to think of those things we have not, rather than of those things we have. This is wrong. We wish we were rich; we wish we were even as well off as somebody else; we wish, and wish, and wish, if not in words at least in thought, unmindful that this is deep ingratitude to God.

BE KIND TO ALL.—Speak kindly to all—to menials and dependents. Never slight or neglect the humblest individual. Remember he is of as much importance to himself as you are to yourself, or as is the greatest man in the world. You have no right to hurt the feelings of any person.

NEW MUSIC BOOKS

The Anthem Harp.

($1.25.) By DR. W. O. PERKINS.

A new book intended as a successor for "Perkins' Anthem Book," published some years since and which was a decided success. The new book contains music perfectly within the reach of common choirs, and is destined to have a great sale.

DITSON & CO. also call attention to their three books for SINGING CLASSES; recently published, already very popular, and worthy of universal adoption.

The Temple.

($1.00.) By DR. W. O. PERKINS.

The Voice of Worship.

($1.00.) By L. O. EMERSON.

Johnson's Method for Singing Classes.

(60 cents.) By A. N. JOHNSON.

The Temple contains an excellent Singing School Course, and a large number of Glees, Songs, Sacred Tunes and Anthems for practice and for use in classes. L. O. Emerson's **Voice of Worship** has exactly the same end in view as the other, but has a different method, and entirely different music. **Johnson's Method** is for those who wish a low-priced book; is admirably simple and clear, has plenty of music, and has a thorough course in Note Reading.

☞ *Any book mailed for retail price.*

A Charming Story Paper

FREE FOR 3 MONTHS!

Every one has heard of **The Cricket on the Hearth,** the largest, brightest, and prettiest $1 publication in America. It is a 16-page, 64-column Illustrated Literary and Family paper (size of *Harper's Weekly*), and is filled with bright and sparkling Serial and Short Stories, Sketches, Poems, Puzzles, etc.—in fact everything to delight and amuse the whole *family circle.* We want 50,000 new readers for our paper for the balance of this year, and in order to obtain them, and introduce it into every home in the Union where it is not already a regular visitor, we are now making the following *extraordinary offer: On and after the appearance of this advertisement, we will send* THE CRICKET ON THE HEARTH **free for three months** *to every reader of this paper who will send us his or her name and address, plainly written, together with* Three 3-cent postage stamps *to pay the actual cost of postage on the paper for that length of time, entering your name upon our subscription books, and addressing a wrapper for each issue as it appears.* Remember, we charge you nothing for the paper—we make it an *absolute free gift for three months* to every one who will write to us for it. Send us five subscribers upon these terms, and we will give you an extra copy, *postage free,* for your trouble. Your subscription will commence with October and extend to the end of 1880. In the first issue that you will receive, we commence the publication of a charming new Serial Story, by a popular author, in the perusal of which we guarantee a rare treat. This *great offer* is made to obtain thousands of new subscribers for the balance of this year, and under no circumstances could it be done, were we not sure of securing as subscribers for future years those to whom we now offer our paper *free. Write at once.* Do not miss this chance, it may not be repeated. As to reliability, we refer to any publisher in New York. Address,
MOORE & WILSON, Publishers, 245 Broadway, New York.

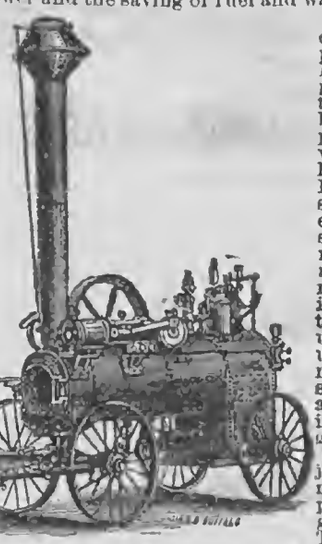
MORE POWER
From Less Fuel and Water,

than any Portable engine built using Ball governor and usual slide valve.

BIRDSALL ENGINE

Possesses more points of excellence than any other now offered. It certainly stands unrivalled in effective power and the saving of fuel and water.



Its saving qualities are super-excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves reputation, saves jobs, saves money, and preserves the good-will of all. Trial given in all cases before requiring payment. For special circulars address

AGRICULTURAL NEWS.

The farm fences of the United States are estimated to cost $1,350,000,000, and require $250,000,000 to keep them in order. Besides the direct cost of fences, the land which they occupy and render worthless is an important consideration..... Private telegrams on Sept. 1 reported the Liverpool provision market higher; tierce beef $2 50 advance in ten days.....Chicago telegraphs that hogs are "grassy," and not yielding the usual percentage of lard.....Fresh beef exports in July were liberal, reaching 7,935,000 pounds, against 3,759,000 in 1879.....Wheat exports for the month of July were 17,575,000 bushels, or 5,000,000 more than in the same month last year. Flour exports were 617,864 barrels, a gain of 238,966 over same time last year.....Corn exports in July were 13,657,000 bushels, or 6,600,000 more than in the same month in 1879.....The largest cotton seed oil mill in the United States is being erected in Little Rock, Ark. The building is 300 feet by 80. The machinery will be run by a 350 horse power Allis-Corliss engine. There will be twelve stands of presses, with four presses in each stand, having a capacity of using 300 tons of cotton seed per day. The works will employ, when completed, 650 men in the various departments..... The South has heavier crops than it can handle and is laying its hands upon all the surplus labor it can scare up. The lower Mississippi valley, where the exodus has depleted the plantation cabins, is particularly straightened. Several hundred laborers are on their way from southern Europe and, as an agent has failed to get many to return from Kansas, quite a number have been secured from about Louisville. This has scared the republicans, who see in it a democratic plot to draw negro voters out of southern Indiana ..... The draining has recently been taken up with great industry by the Western States, its benefits to agriculture having been established. The drains are laid at an average depth of 33 inches, and the cost of digging is about 15 to 20 cents per yard, equal to $25 to $30 per acre, according to width of drains apart, but the increased yield of the crops sometimes reaches 100 per cent. In Ohio, Indiana, Michigan, Illinois, Wisconsin and Iowa, there are now 1140 tile factories, instead of 400 in 1870, and last year these turned out 175,000,000 tiles, equal to 65,000 miles of drain, at a cost $2,812,500..... Florida fruit-growers are beginning to cultivate the lemon with care, and with such good results that it is believed the State will soon furnish almost as many lemons to the trade as she now does oranges.

News from Jefferson, Texas, dated April 26, says: The cotton crop of Texas looks as though it would be cut short by bowl worms, that have appeared in vast numbers. The northern counties have been seriously injured by them, and the counties of east Texas generally have suffered severely. There were heavy rains in July, and the weed is large. There will be a heavy top crop. With a late frost and a long, dry Fall there will be far more cotton raised than anticipated.....The barley crop of Canada is estimated at from 9,000,000 to 10,000,000 bushels, which, after allowing about 2,000,000 bushels for home requirements, will leave a surplus of 7,000,000 to 8,000,000 bushels. .....At a meeting of the Executive Committee appointed by the trustees of the Pennsylvania State College, held August 28, Willis P. Hazard, Esq., of West Chester, Pa., was elected a member of the Advisory Committee of the Eastern Experimental Farm. His special duty will be to devise some means by which said farm shall be stocked with such breeds of cows, etc., as in his judgment will give valuable information to the farmers of Eastern Pennsylvania ..... The company in Florida that has been experimenting with palmetto for making paper has met with such gratifying success that it will erect about twenty paper-mills in the State, where palmetto trees grow in abundance and where the transportation facilities are good.....The Montreal Journal of Commerce reports that over one-half the cheese factories in Canada have contracted for the season's make at about 12½c.; sales have been made there during the week at from 11½c. to 12½c., according to quality, and for prime quality 13c. are asked in some quarters.....Official statistics telegraphed hither on Sept. 2, just published show that in the first six months of the present year only 1,736 oxen, 1,859 sheep and 625 pigs were imported from the United States by France.....

HOME NEWS.

The Chicago, Burlington and Quincy Railroad has completed its steel railroad bridge over the Missouri river below Plattsmouth, Neb., the object being to have a crossing independent of the toll bridge at Omaha..... There is something marvelous in the reduction of the public debt since the war. Over $800,000,000 has been paid off in the last fifteen years, or an average of over $50,000,000 a year, including five years of almost unprecedented business depression.....Professor Spencer F. Baird of the Smithsonian Institute in Washington has labored there for thirty years. His chief work has been in classifying fish and birds. He is fifty-seven years old. He employs two or three stenographers for his correspondence. On his journeys he walks, refusing the aid of a horse. He never goes to a theatre or concert or even to a lecture, because he wishes to go to bed early.....A Mississippi writer says that when a capitalist or banker can make two per cent. a month on money loaned to a planter he will not invest it in cotton mills.

FOREIGN.

Russia has never taken a reliable census, but a St. Petersburg paper has figured out government statistics to show a population of 64,681,000 in European Russia, with an excess of 781,000 births over the number of deaths.....Affairs between Russia and China are not so threatening as a week ago, and it is now believed that diplomacy will suffice in place of the war that has seemed so imminent. .....It is thought at Constantinople that the sultan would yield at once if he thought force was likely to be used by the European Powers, but the conviction is gaining ground that a harmless naval demonstration will be all that is attempted. The Turkish treasury is also a little fuller now, the sheep tax having turned in considerable for the past three months, and now the tithes are relied upon. It is thought that the porte will settle the Montenegrin difficulty, but will not yield on the Greek frontier ..... Empress Eugenie leaves England this Fall to reside permanently at her chateau in Switzerland. She will remove the remains of her husband and son to the oratory of the chateau. She is reported to possess an income of over $200,000, of which she does not spend a sixth.

Exhaustion from Brain Work.

Few of our business or professional men reach the age of forty-five without brain and nervous exhaustion—often to an extent that forces them to relax effort, or abandon work for a time, if not altogether. An occasional use of that vitalizing agent, now so widely known as "Compound Oxygen," would give nature power to restore these wasted forces in a large number of cases. Rev. D. D. Reed, of South Amboy, who was greatly run down by over-work, and consequent waste of nervous energy, after being restored to health through the use of this agent, gives it this voluntary and strong endorsement: "After a most thorough and continued trial of its worth as a remedial and restorative agent, I pronounce its value to be above that of gold and silver. I *freely and voluntarily* commend it to all brain workers as THE BEST thing they can use to secure a restoration of exhausted energies." DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa., send their Treatise on "Compound Oxygen" *free* to all who write for it. It contains a record of many remarkable cures.

VICTOR THREE AND FIVE HOED ONE HORSE DRILLS.

MANUFACTURED BY

EWALD OVER,

Indianapolis, Ind., U. S. A.

The demand for the VICTOR ONE HORSE DRILL is increasing at a wonderful rate. They are used for sowing *Wheat* into and between *Standing Corn* in the fall, as well as for sowing *Wheat, Rye, Oats, Barley, Rice, Peas, etc.*, into *fallow ground*. Next season (1881) they will be provided with a *Fertilizer Attachment*, and no farmer can afford to be without one. Send for Circulars.

THE VICTOR
THREE HOED DRILL

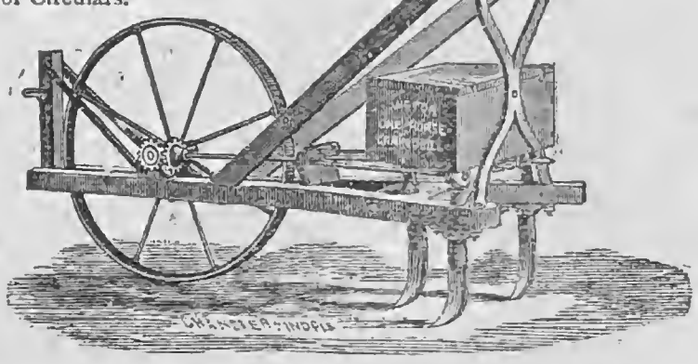
is used for the same purpose as the five hoed, but is better adapted for

Hilly and Rough Ground.

It weighs only 85 pounds, the teeth are 7½ inches from center to center. By removing the front tooth you have a

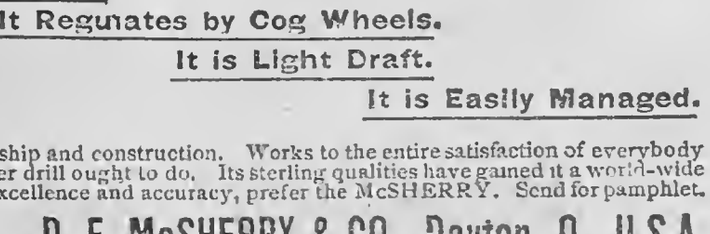
TWO HOED DRILL.

Both THREE and FIVE HOED DRILLS can readily be packed for export.



THE VICTOR
FIVE HOED DRILL,

the lightest one horse drill of the kind in the world, weighing only 125 pounds. It is strong, simple in construction, of light draft. It can be expanded and contracted for five different widths, varying from 8½ to 6¾ inches from center to center of tooth. It has a splendid FORCE FEED, and sows more than half as much as a TWO HORSE drill. For sowing *Rice* the intermediate teeth are removed, making it a three hoed drill sowing Rice in drills 13½ to 17 inches apart.



McSHERRY GRAIN DRILL.

UNQUESTIONABLY THE BEST.

Sows Fertilizers Splendidly.
It Is Very Accurate.
It Regulates by Cog Wheels.
It is Light Draft.
It is Easily Managed.

It is strictly first-class in workmanship and construction. Works to the entire satisfaction of everybody who knows what a grain and fertilizer drill ought to do. Its sterling qualities have gained it a world-wide reputation, and all who appreciate excellence and accuracy, prefer the McSHERRY. Send for pamphlet.

PENNSYLVANIA LAWN MOWER.

Surpassing all Others and Pronounced the Best.

1880

It is the lightest, runs more easily, cuts longer grass, is more durable, requires less repairs, cuts grass more smoothly, is less liable to obstruction, and is of more handsome appearance than any other Mower upon the market. Pennsylvania State Agricultural Society says: "It will, we believe, wear longer, do the work better with less labor, than any other Mower. One of the peculiarities is that it cuts higher grass than any other Mower."

It is pronounced by competent judges the best Lawn Mower the world ever produced.

Every Mower warranted. Address

223 Church St., Phila, Pa.

News of the Week.

HOME NEWS.

An extensive suit at law, involving $10,000,000 is undergoing litigation, at San Francisco. Squire P. Dewey has filed a voluminous complaint in the superior court against the millionaires John W. Mackay, James G. Fair, James C. Flood and James W. Coleman, executors of William C. O'Brien, the Pacific Lumber and Flume Company, the Nevada Bank, the Pacific Refinery and Bullion Exchange and the California Mining Company, demanding an accounting to the California Mining Company and its stockholders for alleged wrongs, frauds and breaches of trust, and, on such accounting, to repay to said company, for the use of its stockholders, all profits and property belonging to the company, obtained by the defendants by means of the transactions set forth in the complaint.... ....It is expected that the earnings of the Pennsylvania Railroad this fiscal year will reach $40,000,000, and that the actual net earnings will be at the rate of more than 20 per cent. on the capital stock.....Captain Bell reports that one of Lieutenant Gresham's parties, under Sergeant Dawint of Company F, Seventh Cavalry, overtook a party of hostiles recently, killed two, wounded several and captured six ponies and mules Gresham's orders were to scout, with small detachments, the country south of Lake station, and between the Little Missouri and Powder Rivers. Major Merrill has not yet returned from the Yellowstone.

The arrivals of immigrants at Castle Garden for the month of August, numbered 25,300. This aggregate exceeds by 4,000 the figures for the same month in any year for a quarter of a century. The figures for this month will be also, it is thought, unprecedentedly heavy, especially in the matter of immigration from the German ports, no less than eight Hamburgh steamers being due during September, all with large steerage lists. The arrivals on Sept, 1, numbered 1,248 by three steamers, the Herder, from Bremen, with 730; the Canada, from Havre, with 316, and the State of Indiana, from Glasgow, with 202.....It is announced that, as a measure of retaliation and self-protection, the Chicago, Burlington and Quincy Railroad will immediately commence the construction of a branch line from Peoria, Ill., to Toledo, Ohio, about 360 miles. This enterprise, the managers assert, is made necessary by the aggressive policy pursued by the Wabash interest in the territory once controlled by the Burlington company, and promises to result in vigorous competition. For the greater part of the distance the route will be located parallel with and very near to the Wabash, striking such important centers as Logansport, Lafayette, Fort Wayne and Defiance.

A New Jersey farmer heard a strange noise among his hens one night seventeen years ago, and he fired a shotgun from his bedroom window. The other day he received $500 from an unknown man, stating that having his legs filled with bird shot had made an honest man of him, and now as he was about to die, he desired to reward the shooter.....A shocking accident occured on the Lowell and Lawrence Railroad, by which five young men lost their lives. There had been a Caledonian picnic at Hackett's pond and five young men named Shinick, Meagher, Ryan, Mack and Nolan, all of Lowell, attended. In the evening, when the time for returning home arrived, they climbed on top of a passenger car, and there, quietly sitting and talking, awaited the train's approach to Lowell, not dreaming of any possible danger, except of detection by the conductor or train hands. Shortly after nine o'clock the train passed Mace's crossing, three miles from Lowell, near which is a low stone bridge. When the train passed under this bridge the young men came violently in contact with the stonework and were swept from the top of the car, all of them being instantaneously killed.

No Cure No Pay.

Dr. Pierce's Family Medicines are guaranteed to cure, for particulars see wrappers and pamphlets. They are reliable and have not sprung into popularity in a week or month and gone out of favor as rapidly, but being sustained by merit, have won a world-wide reputation, necessitating a branch in London, to supply foreign countries, while the home sales are enormous throughout the United States. Golden Medical Discovery purifies and enriches the blood, preventing fevers, and curing all skin and scrofulous affections, stimulating the liver to action, relieving biliousness, and curing consumption, which is scrofula of the lungs. If the bowels are costive take Pierce's Pellets (little pills). Both sold by druggists.

CHICAGO, Ill., May 5th, 1879.

WORLD'S DISPENSARY MEDICAL ASSOCIATION:

Gentlemen—For years I have been a great sufferer. My trouble first started with terrible ague chills and constipations. These left me in 1878 with a racking cough and frequent bleedings from the lungs. Since this time I have been continually doctoring, consulting physicians without number. From them I received no benefit or encouragement. The most noted physicians of our city who last visited me expressed their opinions in the brief but hopeless words, "Take good care of yourself the few days you have to live, we cannot help you." I grew steadily worse under their treatment. One day, through reading your Memorandum Book, I learned of the Golden Medical Discovery. With but little hope of relief, I purchased a bottle and took it. To my surprise and satisfaction it did me more good that all the drugs I had taken the year around. I am now steadily using it with benefit and recommend it to all to be just what it is advertised. Sincerely yours,

JAMES P. McGRATH,
50 Wight Street.

THE MAPES COMPLETE MANURES.

Prepared expressly for use on light and heavy soils for growing WHEAT, GRASS, POTATOES TOBACCO, HOPS, SUGAR CANE, FRUITS, VEGETABLES, etc.

These highly concentrated Manures are now used by thousands of farmers in all the Seaboard and Middle States, as well as in South America and the West Indies.

They are **not stimulants**, but **COMPLETE MANURES**, the same as Stable Manure, and their continued use results in **permanent improvement** of the land.

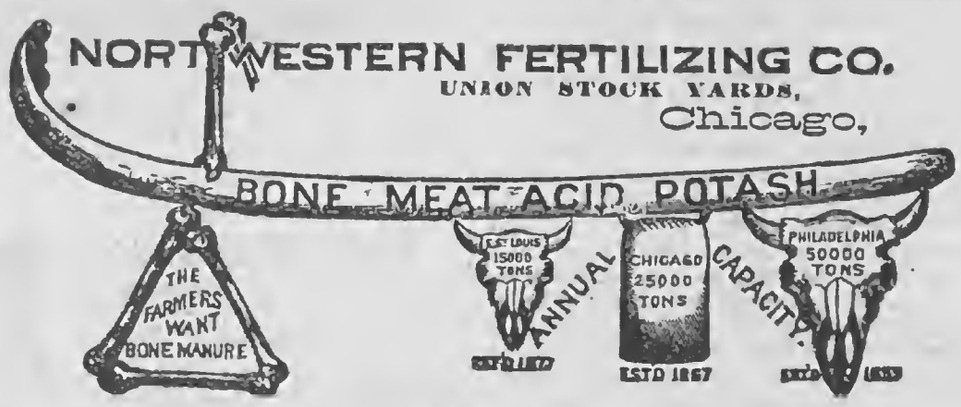
Growers in Ohio and other Middle States find them **more economical**, even after paying railroad freights, than purchased stable manures or local fertilizers.

All Fertilizers, Peruvian Guano, Potash Salts, and Chemicals sold on **guaranteed chemical analysis.** Send postal for pamphlet. Correspondence solicited.

THE MAPES FORMULA AND PERUVIAN GUANO CO.,

158 FRONT STREET, NEW YORK.

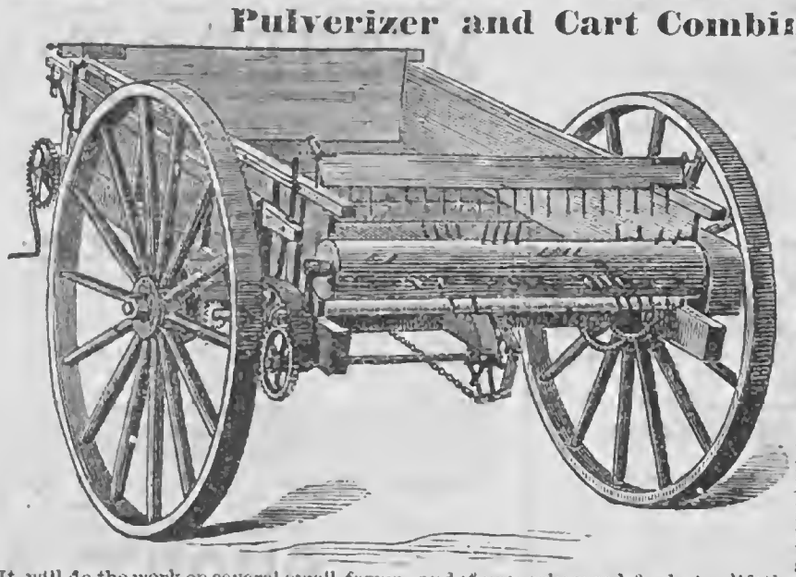
P. VAN ZANDT LANE, *President.* CHARLES V. MAPES, *Vice Pres't and Gen'l Manager.* EDW. V. Z. LANE, *Treasurer.*



Our BONE MANURES stand without a rival for Wheat and Grass. Every Bag guaranteed. They are dry, and drill with regularity. ☞ *Send for Circulars.*

KEMP'S MANURE SPREADER

Pulverizer and Cart Combined.



A new agricultural implement. A machine cart which is drawn behind the forward wheels of any farm wagon, the purpose of which is to pulverize and equally distribute manure, making it more valuable for plant food, and to save time and labor. It will spread all kinds of manure found on the farm, and in one-tenth the time done by hand. But here is not where the chief merits of the machine lie. We have testimonials from over one hundred good practical farmers who are using the machine that say we increase the manure at least 25 per cent. by reason of extra fineness and equal distribution, as we do not leave a single square inch without manure. The time it takes to unload is less than two minutes without manual labor. It is regulated to spread different amounts, so that the farmer may know with accuracy just the amount he is using per acre. It will do the work on several small farms, and if properly cared for last a lifetime. Agents wanted in every town to introduce and sell this machine. Manufactured by the Kemp & Burpee Mfg. Co., owners and Manufacturers for all the States outside of the New England, and by the Richardson Manufacturing Co., Worcester, Mass., for the N. E. States. Send for Circulars and Price List.

KEMP & BURPEE MFG. CO.,
Syracuse, N. Y.

$1000, REWARD

For any Washing Machine that will Wash Cleaner, Quicker, with Less Labor and Wear and Tear of Clothes than the

ROBBINS FAMILY WASHER AND BLEACHER, Pat'd Oct. 3, '71.

THE ORIGINAL AND ONLY PERFECT SELF-OPERATING WASHER IN THE WORLD.

No rubbing required. No more yellow clothes or hard work on washing day. It will wash anything from a lace curtain to a horse blanket, and cannot get out of order.

Good Agents wanted, both male and Female, to whom Liberal Inducements are Offered. Agents can make from $10 to $100 per week,

THE ART OF CLEANSING FABRICS

Is yet but imperfectly understood by thousands of good housekeepers. The numerous devices of friction rollers, pounders, squeezers, washers, agitators, steam wash-boilers, etc., have all failed in one or more of the three essential points, namely: The saving of labor, wear and tear of clothes, or in imperfectly extracting the dirt and discoloration; all of which are accomplished by the ROBBINS FAMILY WASHER AND BLEACHER.

WHAT IS IT REMOVE THE DIRT?

You may ask washer-women and housekeepers, and your answer from nine out of ten will be, "Plenty of elbow-grease," or in other words, laborious rubbing upon the wash-board. And such is the case, for you first rub soap upon the cloth, and then you have to *rub it in* to make the dirt soluble; but does that remove it? No; to do that you must dip it in the water and rub repeatedly to *force water* through the fabric, again and again. That is what removes dirt after having been softened by the chemical action of the soap.

The way in which this could be most economically accomplished has been developed in the FAMILY WASHER AND BLEACHER, which embodies all the above points.

Mechanical devices take the entire time of a person during the whole wash, and will not remove streaks from clothes.

It is harder to operate them than to use the common wash-board. They are constantly getting out of order, and wear out in a short time. With all *such devices*, as well as the *rubbing-board* there is *great friction* and consequent *unnecessary wear* and *tear* of clothing. With the Washer and Bleacher there is *no friction* or *wear* of the fabric whatever; and washing, baking and housework are contemporaneous operations—the firedoing the washing and baking, while the housewife does her housework. As stated, *water force* is what removes dirt from the fibre of the cloth.

A large body of water is required to hold in solution a comparatively small quantity of dirt.

THE PRINCIPLE OF THE WASHER AND BLEACHER

embodies all the essential points. First, we have the desired heat which expands the fabric and causes it to discharge the dirt. Second, we obtain a powerful suction beneath the clothes, which produces a rapid *downward current* or *water force*, through and through them, thereby removing the dirt. Third, we use a *large body of water*, which holds the dirt in solution. Fourth, we use but a small quantity of soap. Fifth, the washing is done by water and *not by steam*. This process cannot injure fabrics. It cleanses thoroughly, *rinses the clothes* being all that is required to complete the operation.

THE PHILOSOPHY OF THE WASHER AND BLEACHER IS THIS:

We have fibs. of metal, which attains a much greater degree of heat than the water surrounding it, consequently the water *underneath* the Washer becomes hotter and more expansive than in any other part of the boiler, and is thereby thrown to the surface through the tube; thus tending to produce a vacuum underneath the Washer at the bottom of the boiler, into which the water is rapidly drawn.

As it passes along the channels of the Washer, the curved and contracted throats of which prevent its flowing backward, it becomes hotter and hotter, consequently more expansive and more forcible until thrown to the surface, thus producing a powerful suction beneath the clothes *through which* the water *must pass* in a rapid *downward current* thereby obtaining a *water force* which cannot be obtained by any other method known in cleansing fabrics. Thus, we get a combination. FIRST, WE HAVE THE DESIRED HEAT. SECOND, PERFECT CHEMICAL ACTION OF THE SOAP. THIRD, FORCE OF WATER—ALL OF WHICH ARE REQUIRED TO THOROUGHLY CLEANSE AND PURIFY ANY FABRIC.

THE IMPROVED WASHER,

has a perfect-fitting pipe, and is a combination of metals which does not become sticky or dirty. It comes out of the boiler as bright as new.

THE CAPACITY OF THE WASHER AND BLEACHER.

There are two sizes: No. 1, the family size; No. 2, suitable for small hotels, restaurants and barber-shops, boarding-houses, etc.

The Washer is composed of metal and cannot get out of order.

The family size weighs about 5 lbs., and is only 8 inches long by 5 inches wide, and 13 in. deep.

The discharge pipe is 13 inches high over that, and is 1½ inch in diameter. It throws water in a solid, unbroken stream, at the rate of 6 to 8 gallons per minute. It will work in any flat bottom boiler. It takes only 3 or 4 ounces of soap in 10 or 12 gallons of water, and will wash bed or table linen, a boiler full in 10 or 15 minutes, wearing apparel in from 10 to 30 minutes, and will remove streaks without rubbing; requires no previous preparation of the clothes, such as soaking over night. Take the clothes dry, and when the Washer gets *thoroughly at work*, fill the boiler as full as it will hold by gently pressing them down with a stick. Use no chemicals, only good soap and soft water. If the water is hard, it may be softened by a small piece of borax, which is harmless.

FOR LACE CURTAINS this Washer is *invaluable*. It can cleanse them as no other process can, and without the slightest danger of injury.

No. 2, or small hotel size, is 8½ in. long, 7¾ in. wide, 13 in. deep, and weighs about 8 lbs. It will work in a flat-bottom boiler, holding 15 to 25 gallons, and wash of average pieces from 1,500 to 2,000 per day; or it may be used in any smaller boiler that has a flat bottom large enough for it to rest upon.

For hospitals this Washer is pronounced by the medical faculty invaluable, being the most *powerful disinfector* known; leaving the fabrics pure as when new. By bleachers and chemists it is said to be the most powerful method of removing dirt and vegetable matter from fabrics ever known.

THE INDUCEMENTS WE OFFER,

We want a Local Agent in every town in the United States. We *know* from experience that reliable, energetic men can make money selling the Washer and Bleacher in any community.

We want first-class men as GENERAL AGENTS; men capable of managing one or more counties.

To such we give a duly executed Certificate of Agency,

We furnish descriptive circulars for distribution among families. Also large posters for advertising in public places. Printed directions for using are sent with each Washer.

The retail price of No. 1 WASHER, in New York, is $3.50; No. 2 WASHER, $5.00; No. 1, $24.00 per dozen; No. 2, $36.00 per dozen.

SAMPLE, OR SINGLE WASHER.

WE SEND SINGLE OR SAMPLE No. 1 WASHERS, PREPAID, TO YOUR NEAREST RAILWAY EXPRESS OFFICE, in any part of the United States east of the Mississippi and Missouri Rivers, Kansas, Nebraska, Arkansas, Louisiana and Texas, for $3.50.

SPECIAL NOTICE.

As to the reliability of this Company, we refer you to the MERCANTILE NATIONAL BANK of this city, or to any Express Company in New York. Also to the Publishers of the following named well known leading Journals, viz.:—New York *American Agriculturist*, Weekly *Sun*, Weekly *Times*, Weekly *Tribune*, Weekly *Witness*, Weekly *World*, *Christian Advocate*, *Christian at Work*; Boston—*Youth's Companion*, *American Cultivator*; Chicago *Inter-Ocean*, Cincinnati *Gazette*, Springfield *Farm and Fireside*, St. Louis *Journal of Agriculture*, Detroit *Free Press*, all of whom have frequently editorially endorsed *us* as well as our *Washer*.

From the *Rural New-Yorker*, May 8, 1880:—"Lately we had special reasons for thoroughly testing the character of the Robbins Washer and Bleacher. The test has been fully made for upwards of a month in the family at the Rural Farm, and has demonstrated the great merits of this machine. As in the case of hundreds of others, the first impression of the mistress of the house was that the old time use of "Elbow grease" was essential to the thorough cleansing of the soiled clothing; but repeated trials of this device have convinced her that this belief was due merely to immemorial usage, and had no real foundation in fact; for on every occasion in which it was used, this Washer did everything that is claimed for it in an entirely satisfactory manner. We can, therefore, unhesitatingly recommend it to all our readers who may be in need of a first-rate Washer and Bleacher."

From the N. Y. Weekly *Tribune*, May 19, 1880:—"Washers Again.—We have several inquiries concerning the Robbins Washer and Bleacher. It does exactly what is claimed for it, and is cheap at ten times its cost."

In ordering, write plainly your name, post-office, county and State. Also the name of the express office to which you wish the Washer forwarded.

CASH MUST ACCOMPANY ALL ORDERS.

Remit by Post-office Order or registered Letter. We insure the safe delivery of all Washers ordered as above. Money may also be sent by draft on New York.

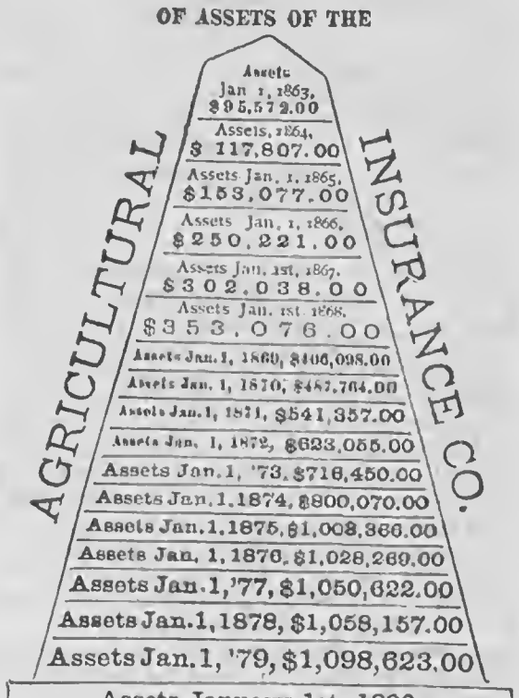
Send for sample and secure A BUSINESS THAT WILL PAY YOU WELL.

When you order or write, mention this paper. Address

BISSELL MANUFACTURING CO.

50 BARCLAY ST., NEW YORK, U. S. A.

PYRAMID
OF ASSETS OF THE



Assets January 1st, 1880,
$1,137,549.00

Capital, $200,000. Net Surplus, $235,153.81.

THE ATTENTION of owners of Farm Property and Residences is invited to the above Pyramid, showing the uniform and sure growth, during the last seventeen of its 27 years of existence, of a fire insurance company whose charter limits its business to their class of property—the **Agricultural Insurance Company**, of Watertown, N. Y. The figures represent the amount set apart at the dates given for the PROTECTION OF POLICY HOLDERS.

Twenty-seven years of patient toil has made this the strongest and largest Company doing an exclusive Dwelling Business in the United States, if not in the world. It now issues 45,000 policies a year. No other like Company can show such growth and increase.

The history of this Company proves that a LARGE business, well scattered, managed with prudence, *can be done with a very small profit from each risk*, and afford perfect security, which will grow stronger every year.

While nine-tenths of the "Mutual" fire insurance companies, and many of the Stock companies, have failed on account of reckless or extravagant management, or doing too small a business, the OLD AGRICULTURAL, by economy, energy and prudence, has every year added a substantial amount to its Assets, for the indemnity of its patrons, and it now occupies a position in the confidence of the public second to no other Company.

From year to year it spreads the base of its Pyramid and gains strength.

EXTRACT FROM CHARTER.—"*Article 2.* This Company is formed for the purpose of insuring Farmers' Dwellings, Private Residences, Barns and Outbuildings, with their contents, and other property not more hazardous," and is strictly confined to this class of property.

JNO. A. HERMAN, President.
ISAAC MUNSON, Secretary.

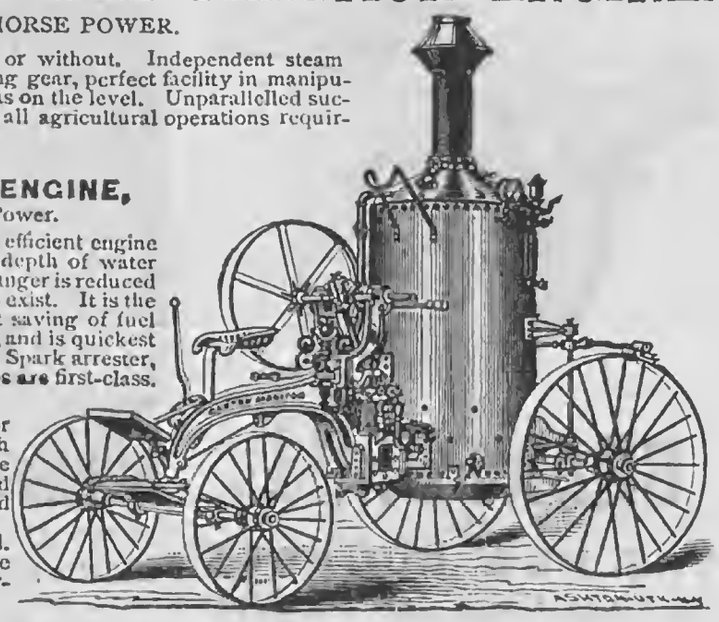
CANTON MONITOR TRACTION ENGINE.

10, 12 AND 16 HORSE POWER.

Self-steering with hub motion, or without. Independent steam pump, jack-in-the-box compensating gear, perfect facility in manipulation. Entire safety on hill sides as on the level. Unparallelled success as a road engine. Adapted to all agricultural operations requiring power.



CANTON MONITOR ENGINE,

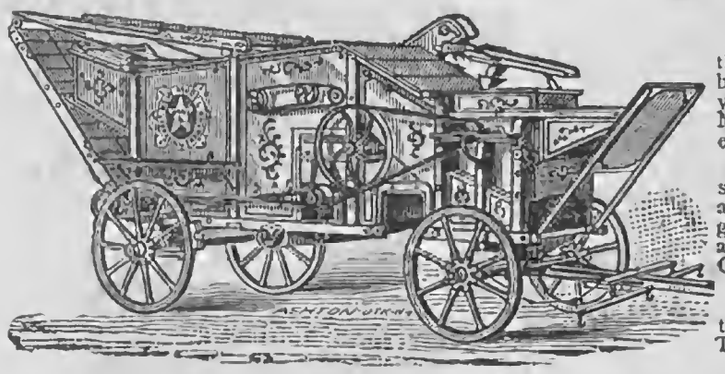
6, 8, 10, 12 and 16 Horse Power.

The most convenient, simple and efficient engine made. Being upright, with great depth of water on crown, sheet and fusible plug, danger is reduced to a minimum, if any can be said to exist. It is the easiest to fire and raise steam, most saving of fuel and water, light weight, light draft, and is quickest set for work, needing no leveling. Spark arrester, safety "pop" valve, and all fixtures are first-class. Every engine is carefully tested.

The record of the MONITOR for SAFETY is unexampled. Although our production is now up in the thousands, no life has been lost and no serious accident has occurred with our engine.

All the working parts are steel. As we use the best material the market affords, the engine is as durable as an engine can be made.

MILLER'S NEW MODEL VIBRATING THRESHER.



A combination entirely new to the threshing public, never having been thoroughly tested until last year. The success of the NEW MODEL this year, 1880, has been extraordinary.

Experienced threshers are enthusiastic in its praise, and with one accord give it the first place as a grain saver and cleaner. It has also given perfect satisfaction in Clover and Flax.

For descriptive circulars, address the manufacturers of the MONITOR and NEW MODEL.

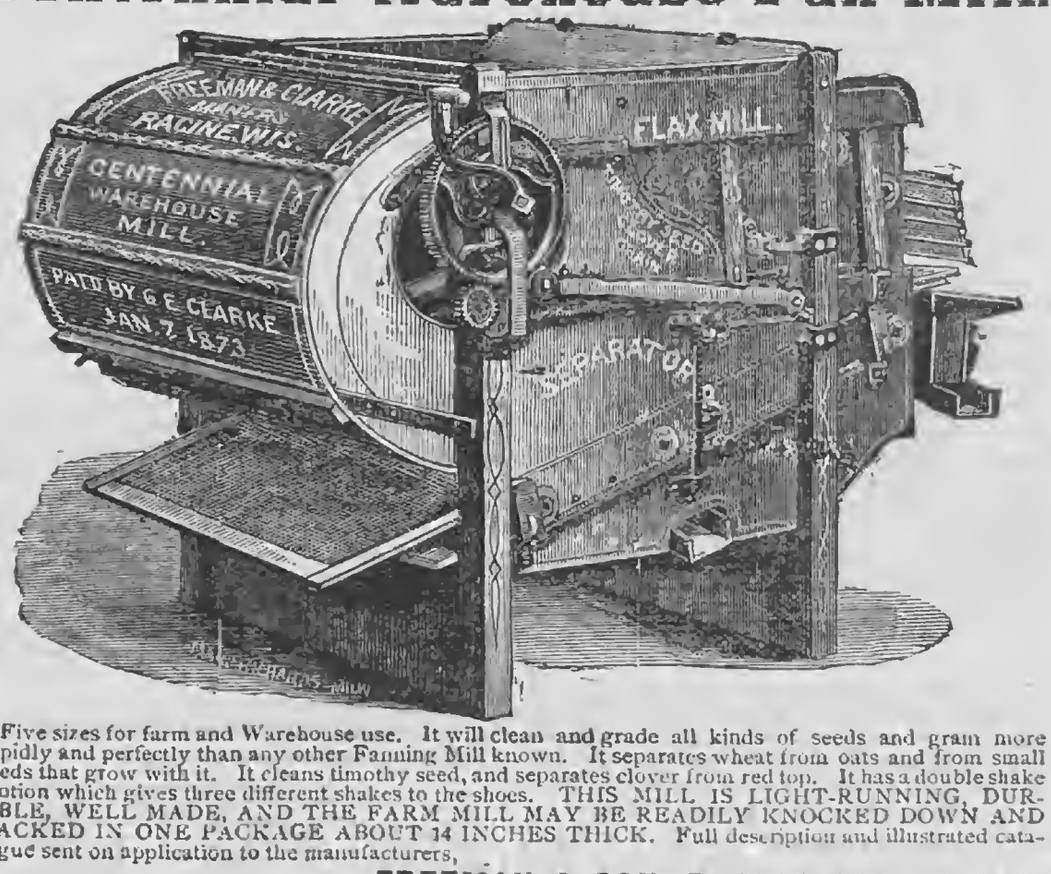
Centennial Warehouse Fan Mill.



Five sizes for farm and Warehouse use. It will clean and grade all kinds of seeds and grain more rapidly and perfectly than any other Fanning Mill known. It separates wheat from oats and from small seeds that grow with it. It cleans timothy seed, and separates clover from red top. It has a double shake motion which gives three different shakes to the shoes. THIS MILL IS LIGHT-RUNNING, DURABLE, WELL MADE, AND THE FARM MILL MAY BE READILY KNOCKED DOWN AND PACKED IN ONE PACKAGE ABOUT 14 INCHES THICK. Full description and illustrated catalogue sent on application to the manufacturers,

FREEMAN & SON, RACINE, WIS., U. S. A.

HARRIS FARM TRUCK,

To be used in front of the Plow, Harrow, Cultivator, Shovel Plow, Road Scraper, Horse Fork

It saves from 12 to 20 per cent. of draft, and saves its cost in help to team every year.

The cheapest, most simple and practical farm implement in the world.

Hon. P. T. BARNUM writes:

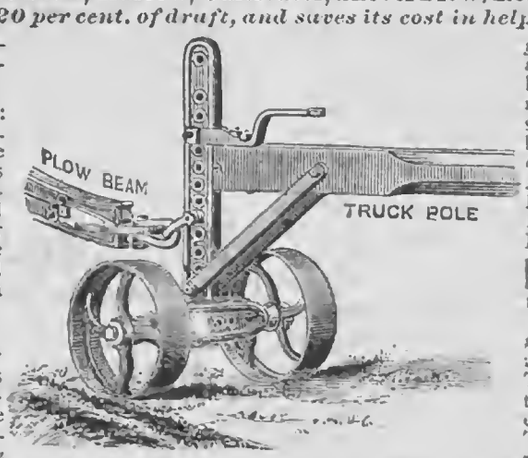
Bridgeport, Conn.

My Dear Sir: I enclose check for Farm Truck; it is the most valuable implement I have seen lately, and I would not part with it for five times its cost. The piece of land being plowed could not be plowed with horses without it.

Yours truly,

P. T. BARNUM.

It is no experiment, as *several thousand* have already been sold, and we have to hear of *a single instance where they have been given a fair trial by an intelligent farmer*, that they have not received his hearty approval and given entire satisfaction. It is endorsed by the *Rural New-Yorker*, *Country Gentleman*, Prof. Arnold, Hon. Harris Lewis, Hon. James Geddes, Flint Blanchard, Esq., Pres. W. N. Y. D. A., and many other prominent farmers who have given it a practical test in the field.



AGENTS WANTED in *every town* in the United States, and exclusive control of Territory will be guaranteed. Where no agency is established we will ship the Truck, *freight prepaid*, on receipt of Price, $6.00.

EVERY TRUCK WARRANTED TO WORK AS REPRESENTED.

MRS. WARREN'S HELPER.

"I DON'T know that I ever should have gotten through my Fall sewing so well if it had not been for the help I had from poor Mrs. Duane across the way," said Mrs. Warren to her friend.

"I did not know that she ever went out sewing. I don't see how she can and keep those four children so tidy."

"Oh, she did not set a stitch for me, but she helped me greatly, all the same."

"Did other work for you while you sewed, I suppose,"

"You would never guess the puzzle, so I will tell you. It was just looking at her as she sat by that morning-glory-shaded window, stitching away at her childrens' clothes with such a swift needle, every minute that she could catch from her housework. I knew her resources were very small; that she was obliged to piece up and make over and hand down to the very limit of possibilities, yet she did it with such cheerfulness, always singing at her work if she was not chatting with her children; it made me ashamed of my fretfulness.

I was dreading to commence these pretty plaids for the girls because I could not quite decide upon the patterns, and then it would be such a trouble this hot weather.

That thrifty, busy little housekeeper made me ashamed; every time I looked at her it was an inspiration.

I cut out the dresses and put the sewing machine at work on them; then if I felt my zeal lagging I would make an errand across the street to see Mrs. Duane work a few minutes.

One morning I happened in on a "stocking day," as she called it. She had a collection of old stockings of various sorts and sizes, which she was cutting down and piecing out with new heels and toes until they were about as good as new for the Fall campaign.

I asked leave to add to her collection and the offer was thankfully accepted. I took over an apron full, which she asserted would keep the hildren well supplied all Winter. I had no idea there was so much 'goodness' in old stockings. I always came home with energies brightened and wits sharpened, so that my work seemed very easy and pleasant. One day I told her how much good I was getting from her example of steady industry and the little woman just dropped her work in her lap and covered her face with her hands, laughing and blushing. The idea of having an influence was very odd to her.

But that was just the help that carried me through the Fall sewing, and I believe in giving 'honor to whom honor is due.'" LOIS.

MATRIMONIAL ADVICE.

Now girls, I want to say one word about getting married. The reason so many unhappy marriages are made, is just because young people do not stop to take a sober second thought upon the matter; but rush on without once considering what the poet calls, "the eternal fitness of things."

Getting married ought not to be the great object of a girl's existence. I often think, when I see young folks so anxious to get married, that if they could look into the future and see what trials, sorrows and troubles were ahead, they would shrink back and not have courage to take vows that are to last till death annuls them.

This getting married is a serious piece of business, any way it can be fixed. Because a young man drives a fast horse, dresses well, and is an agreeable escort, it is no sign that he will make a kind, considerate and loving husband. You want to study him, try him, test his temper, and take time to do it in.

Don't marry in a hurry—you will have time enough to repent, if you do. Never marry for beauty or show. Do not marry a man who is very fond of fast horses; they do not make very nice husbands. I never see such a man but I think, "I pity the girl who marries you." It is a great venture to trust such a man; so girls, look out!

Again, do not marry a man who has a taste for strong drink of any kind. As you value your life's happiness and comfort, let such a man alone; better die than be tied for life to such a person; yes, it is a living death, and you are putting your neck into a heavy yoke.

Never marry a man who cannot govern his temper. He is not safe, either at home or in public, and he will keep you in tormenting fear all your life; and lastly girls, do not marry a man till you have known him a whole year, at the least; and made him a study for six months; and do not be afraid of being an old maid! Better keep single than be an unhappy wife.

GRANDMOTHER.

EMBROIDERY ON NET.

THE best Brussels net should be used for this purpose; the embroideries suitable and generally used are flowers in silks, worked much in the same manner as crewel embroidery; darning in silk, and combining some of the embroidery stitches with it. Trimming for ball dresses, a coverlet worked on stripes, with alternate ones of satin between would be salable articles in this work. With regard to the small articles about which inquiries have been made, I would suggest the following: Foot warmers can be made of cashmere, either lined with common fur or quilted. They are made of a half circle, and are just large enough for the feet to be slipped in. The material should be powdered with small flowers in crewel embroidery before making up. Satin can be applied to the frames for visiting cards and almanacs, embroidered with silk and gold cord, and then placed over an oval or square of card-board, slightly padded beneath. Penwipers in the form of a teapot cosy can be made of any small shreds. Squares of satin make nice lace cases slightly wadded, the satin painted and edged, with cord and lace beyond; the two pieces of satin forming a pocket, so that the lace can be slipped in. Strips of satin, sewn together, make purses about a quarter of a yard long, very good for holding sewing silks; also tiny parasols for penwipers. A jockey cap is a good idea for a pincushion made of scraps. Toilet tidies, so often described, can be covered with net. Purses made of net and filled with sugar plums having sugar rings sell well to children. Stamp cases can be made out of odd scraps, and if those artistically inclined will paint upon them flowers or floral initials they will double their value.—Artiste.

HINTS.

AMMONIA.—This is very useful. It cleans gentlemen's coat-collars and felt hats nicely. Dilute with water one-half, use a cloth same color, rub well, using several clean cloths if very much soiled. A few drops in a bath water, especially if hard water, is refreshing and purifying. It cleans glassware, silverware, windows, paints, and bottles beautifully and easily. It takes up the grease spots from the floors. It is good for a stimulant to house-plants; one teaspoonful to one gallon of water once a week. Put a few drops in a basin of water, wash your hair-brushes in it, and see what it is good for. It is good for catarrhal cold, and stings of insects. Inhale for colds, and apply to affected part in stings.

LAUNDRY HINTS.—Black silk stockings are apt to fade unless washed with care. Take a quarter of a pound of soft soap, the same quantity of run honey, and a large wineglassful of gin; mix these until dissolved in a quart or three pints of warm salt water. Wash the stockings well in this and rinse them in two waters (rain water is best), squeeze them in a towel, smooth them out and lay them on a sheet to dry in some airy place, but not in the sun. Smooth them with a cool iron on the wrong side. If carefully and quickly done in this way, black silk stockings will retain their color. Black merino stockings should be washed twice in a lather of milk-warm water, no soap rubbed on them. Rinse in cold water with salt in it; dry them quickly in the open air, if possible, and when half-dry, mangle them.

KEROSENE STAINS UPON A FLOOR.—A correspondent writes from Pilot Mound, Minn., that the breaking of a kerosene lamp has caused a "frightful spot" upon the floor, and wishes to know how it can be removed. Good kerosene has a boiling point of 380 degrees, considerably above the melting point of lard—hence in order to drive it completely from any fabric, from paper, or from wood, it must be heated high enough to form a vapor, when, if pure, it may be completely removed. Heat may be applied to the floor by using flat-irons sufficiently hot, first placing a piece of paper over the spot. It may be that after the oil is driven from the surface by heat, the stain will reappear; some of the oil remaining in the wood will be brought to the surface by capillary attraction. In such a case it will be necessary to repeat the operation as often as the stain appears.

COLUMBIA BICYCLE.

Bicycle riding is unsurpassed as a method of traveling, whether for speed, sport or the renewal of good health. No horse can compare with the Bicycle for endurance; no other pastime is half so fascinating, and the exercise is recommended by the medical profession as being the most conducive to health. Apple-yard rode 100 miles over a common turnpike road in 7 hours, and Waller has accomplished 1,400 miles in 6 days. THE EMPIRE.

MANUFACTURED BY THE
HAGERSTOWN STEAM ENGINE
AND MACHINE COMPANY.
Hagerstown, Md., U. S. A.

Made in five sizes, and for Steam or Horse-power. AWARDED THE HIGHEST PREMIUM BY THE NATIONAL FAIR ASSOCIATION, Washington, D. C., 1879, in competition with all the leading machines of the United States.
It justly claims to be the Best Thresher, the Most Rapid Separator; the Most Thorough Cleaner; the Easiest Handled; the Best Built; the Most Durable, and the Cheapest Repaired.
These are no unmeaning words that may be undeservedly said about any machine, but they are facts that have been demonstrated many times, both in the Field and on the Fair Grounds. We invite investigation.
Write for Circulars and Price List before purchasing.

PERSONAL ITEMS.

Tennyson attained his seventy-first birthday on August 6.

Ex-Governor Paul O. Hebert has just died at New-Orleans.

U. S. Grant, Jr., as a speculator is said to have made a fortune for himself and added to his father's little pile.

Bishop Elder of Cincinnati, has declared that no banged or frizzled hair will be allowed among the women of his congregation.

Julian Hawthorne, the novelist, at present residing in England, has accepted a consulate in Japan, offered him by the government of the United States.

Gen. Grant never voted but once at a Presidential election. That was for Buchanan in 1856. He states that he has absolutely declined to accept the offer of the presidency of that Boston mining company.

The ex-King and Queen of Naples are living at Houlgate. Their ex-majesties are in very reduced circumstances, for when they were in power they forgot Bismarck's maxim, *beati possedentes*, and so they occupy a modest suite of rooms in a hotel, where they live like ordinary mortals.

The Viceroys of England in India have rarely lived long. The Earl of Mayo perished at Port Blair under the blow of an Afghan convict; Lord Lawrence, who preceded him, died prematurely through his Eastern labors; Lord Elgin died upon the Indian hills, and Lords Canning and Dalhousie barely reached the shores of England to pass away.

Milton Carter, of Columbia, Tenn., went about threatening to kill John Holcombe on sight John heard of it and armed himself. The two men met in a saloon, and Holcombe, without waiting for his enemy to begin the attack, emptied a double-barreled shot-gun and two chambers of a revolver. Milton, who killed a brother of Holcombe four months ago, died without a struggle.

"General Washington is a tall, well-made man," said a writer in 1798, "rather large-boned, and has a tolerably genteel address. His features are manly and bold, his eyes of a bluish cast and very lively; his hair a deep brown, his face rather long and marked with the small-pox; his complexion sunburnt and without much color, and his countenance sensible, composed and thoughtful: there is a remarkable air of dignity about him, with a striking degree of gracefulness; candor, sincerity, affability and simplicity seem to be the striking features of his character."

[Kansas City Times.]

Mr. William Hadeler at the Marathon Hotel, Wausau, after extreme suffering with rheumatism, without any benefit from physicians or various preparations, was cured by St. Jacobs Oil.—Wis. Exchange.

ST. JACOBS OIL

TRADE MARK.

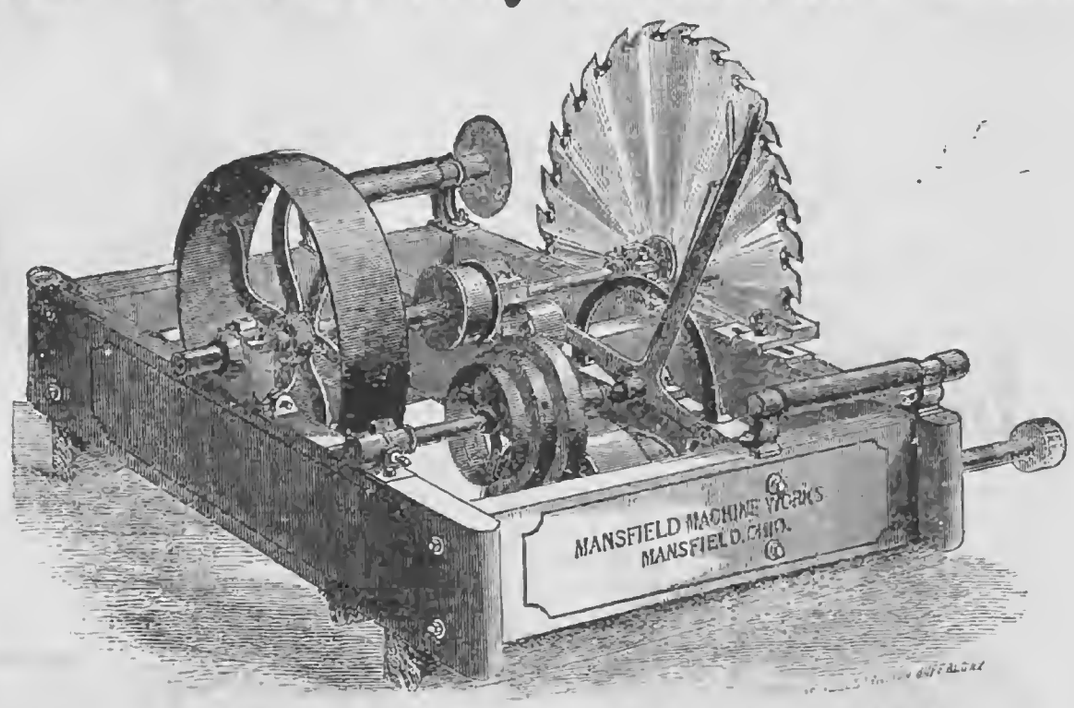
The Mansfield Pony Circular Saw-Mill.



Expressly designed for Farm Engines. Capacity 3,000 to 6,000 Feet of Lumber per day.

After many years' experience in the manufacture and sale of Saw-Mill Machinery, and from the numerous unsolicited testimonials we have received in favor of our PONY CIRCULAR SAW-MILLS, we offer them to our customers, believing them to be *the best that can be found.* They will cut more lumber, and do it better, than any other mill of their weight or price, and at the same time are less apt to get out of repair. ***These Mills are Capable of Earning their Price in from 5 to 8 Weeks.*** Our Mills are equipped complete [no charge for extras], and each Mill will saw lumber 34 feet long. Saw Mandrel, Feed Shafts and Head Block Shafts made from Patent Cold-Rolled Iron, with three long bearings on Main Mandrel. Each Mill furnished with Independent and Simultaneous Lever Setting Head Block, Planer Saw with 500 Extra Teeth, Noiseless Friction Feed, Boxing arranged to give Saw lead, Seasoned Oak Ways with Wrought-Iron Track. ***Send for Illustrated Circular giving full description of Pony Saw-Mill and also of our large Single and Double Circular Saw-Mills, different sizes, capacity from 10,000 to 40,000 feet of lumber per day.***

MANSFIELD MACHINE WORKS, Mansfield, Ohio, U.S.A.

The Literary Revolution.

In January, 1879, **The Literary Revolution** was inaugurated by the publication of one small volume. In September, 1880, its list, published and in preparation, comprises over 120 volumes of standard books. It gives employment to about 500 hands, is actually delivering to purchasers over three tons of books a day, or over 1,000 tons a year, and is so far from able to fill all orders that additional buildings have just been leased, machinery purchased, and other steps necessary taken to double the present product within the next sixty days. To meet the popular demand for the coming twelve months at least 2,000,000 and probably 3,000,000 volumes will be required. The almost wonderful success which the Revolution has achieved is doubtless to merit. II. What is worth reading is worth preserv- ples, which are: I. Publish only books of real Work on the basis of the present cost of making ing—all books are neatly and strongly bound. III. years ago. IV. Books have commonly been con- books, which is very much less than it was a few sidered luxuries; in a free republic they ought to be considered necessities, and the masses will buy good books by the million if prices are placed within reach. V. To make $1.00 and a friend is better than to make $5.00 only, and 1000 books sold at a profit of $1.00 each gives a profit of only $1,000, while 1,000,000 books sold at a profit of one cent each gives a profit of $10,000; and it is more pleasure as well as more profit to sell the million. The most important publication thus far undertaken—indeed the most important work ever published in this country—a work that every intelligent person wants in his library, is the Library of Universal Knowledge. It is a verbatim reprint of the last London edition of Chambers's Encyclopædia, with copious additions by American editors, about 15,000 topics being added to the original work. It will contain, complete, about 10 per cent more than Appleton's and 20 per cent more than Johnson's Cyclopædia, though costing but a fraction of the price of either. The publication of a large type edition of the Library of Universal Knowledge is just begun, vol. 1. being issued September 1. Two or more volumes will be issued each month till the whole is completed in 15 vols. octavo of nearly 1,000 pages each. The price of the large type edition in cloth binding is $1.00 per volume; bound in half Russia, gilt top, price $1.50 per volume. According to our usual custom, special reduction in price is made to early purchasers, and during the month of **September only** orders for volumes I., II., or III., either or all, will be received at the nominal price of 65 cents per volume for the cloth, 95 cents per volume for the half Russia, gilt top. As a portion of the Library of Universal Knowledge, the Chambers's Encyclopædia is also published separately, complete in 15 volumes of clear nonpareil type, and sold, bound in cloth, for the nominal price of $7.50, or in half Russia, gilt top, for $15.00. In this style 12 vols. have already been issued, vol. 13 will be ready September 10, and Vols. 14 and 15 a few days thereafter. On this also special terms are given to early purchasers, the price being to those whose orders are received during September $6.75 for the set complete in cloth, $13.50 for the half Russia gilt top. The volumes already issued will be sent at once by express, and the remainder when completed in October. The Revolution is always undertaking new enterprises and accomplishing new victories. During September in Religion we expect to complete Young's "Analytical Concordance to the Bible," the great "Webster Unabridged" of religious literature, and a 50 cent edition of of Smith's Bible Dictionary. In Biography, two volumes added to our Acme Library of Biography contain 10 vols. selected from the famous English Men of Letters series, at little more than one-tenth the cost heretofore. In Poetry we shall soon have the Iliad and the Odyssey of Homer, translated by Pope, and a large type edition of Shakespeare. In History a cheap edition of the celebrated Froissart's Chronicles, with over 120 illustrations. In Fiction, Scott's "Ivanhoe" and Bulwer's "Last Days of Pompeii." In Juvenile, "Karl in Queerland," profusely illustrated. The cost of making books diminishes in large degree as their number is multiplied. Many of our books are selling in so much larger quantities than we anticipated that we find it in our power to considerably reduce their prices, and we do it with a great deal of pleasure. Among those so reduced are the histories of Macaulay and Gibbon, Taine, Rollin, Josephus, Modern Classics, Milton, Virgil, Dante, Koran, Bunyan, Crusoe, and several others.

BIRDSELL MANUFACTURING CO., South Bend, Ind., U. S. A.

DEDERICK'S HAY AND STRAW PRESSES are manufactured cheaper at price than any others as a gift or no sale. If inexperienced purchasers are confused by manufacturers of inferior machines who claim their presses are best, then order a press of each on condition that you keep the best, and advise all that DEDERICK'S PRESS will be there. The absence of all others will then convince you that DEDERICK'S PRESSES are beyond competition. Grand Centennial and Paris World's Fair Prizes, and all the United States Fair Premiums for years past for DEDERICK'S PRESSES. Beware of presses infringing Dederick's Patent Press and Bale.

Address for Catalogue. P. K. DEDERICK & CO., Albany, N. Y.

N. B.—The attention of the public is respectfully invited to other advertisements of Hay presses which have been circulated and published all of which make Dederick's patent sectional quadrilateral bale bound lengthways, and by Dederick's patent process and machinery, and some even have the cheek to use Dederick's Continuous Hay Press patent, without which the operation must stop to tie and remove the bale. Dederick has suits pending to enforce these patents, and will in due time prosecute every purchaser for $10,000 damages. Meantime he earnestly remonstrates against this high handed piracy of his property, and warns the public against being swindled into partnership in a steal with unscrupulous characters. Why join a steal for the benefit of thieves and receive an inferior machine, when the same price will purchase a good one of the owner. While Dederick bore the immense expense of introducing these improvements that are such a benefit to the hay interests of the country, these communists opposed him, and now propose to steal not only Dederick's patents, but the capital represented by their introduction into use. Send for free copies of patents in proof of this.

Humorous.

THE man who was blown up in a steamboat explosion requested that he be buried near the chap who blew out the gas, and that a hand be engraven on his tombstone, with the forefinger pointing toward the victim of gas, and the following beautiful lines beneath: "Steam fixed my fate—Gas Fixtures."

"How long will it be before you get this work done?" said a lady to an apprentice, who was painting her house. "Well, I don't know, mar'm," said he; "the boss has just gone to look for another job; if he gets it, I'll be done to-morrow, but if he don't, I'm afraid it will take me all next week."

A GENTLEMAN the other day saw his little daughter dipping her doll-baby's dress into a tin cup, and inquired "What are you doing, my daughter?" "I'm coloring my doll's dress red." "What with?"—"With beer!" "What put such a foolish notion into your head, my child? You can't color red with beer." "Yes, I can, pa; because ma said it was beer that colored your nose so red!"

For sinking spells, fits, dizziness, palpitation and low spirits, rely on Hop Bitters,

HEART-WHOLE.

WIFE:—"My Dear, where did the loving little thing get her heart?"
HUSBAND:—"I am at a loss to know surely, unless from you, I have mine, still!"

☞ *Send for Price List.*

To the Readers of the Rural New-Yorker:

It is well known that hot weather brings sickness and that the greatest care is necessary to prevent disorders even on the part of those most healthy. What there is in the heat that should cause disease cannot certainly be known, but cholera, dysentery, debility, lassitude, vertigo and many other sudden and dangerous maladies come every season and cause great suffering and thousands of deaths. Few people go through the Summer without unpleasant symptoms. The mouth becomes dry and parched, the tongue furred with white, the pulse irregular, the head feverish, the body cramped and the limbs swollen and tired. Ladies especially, with their natural delicacy and tendency to female troubles, find the hot weather almost unbearable, while little children are dying every day from exhaustion and because Parents neglect precaution and care. A prominent and well-known physician of New York asserts as his positive belief that more than three-fourths of all so-called Summer complaints arise from disordered secretions, and that these secretionary organs, which, by being out of order, cause so much trouble are the kidneys and liver. The brain controls the life, but the lower part of the body rules the health.

There is one, and only one known vegetable that will absolutely regulate and control the Kidneys and Liver at all times and thus prevent the many dangers of the Summer. That vegetable (a West India leaf) is used as the basis of Warner's Safe Kidney and Liver Cure. It is pure, pleasant to the taste and absolutely certain in its results. It keeps those who intelligently use it in perfect health, and cures those whose secretions are deranged. For all urinary complaints of either sex it is infallible. For all bilious troubles it is certain. For the hot season it is invaluable and every person of care and intelligence should not fail to keep Warner's Safe Kidney and Liver Cure near at hand, and use it upon the approach of the slightest symptoms. It may save your life or that of some dear friend; it will certainly prevent much suffering. It is for sale by druggists in all parts of the world; be careful and take no other. "A word to the wise is sufficient."

Metallic Shingles.

Make the most durable and ornamental roofs in the world. One-fourth the weight of slate, and will not break from any cause; cannot blow off, and are absolutely tight. Send for descriptive circular and reduced prices to

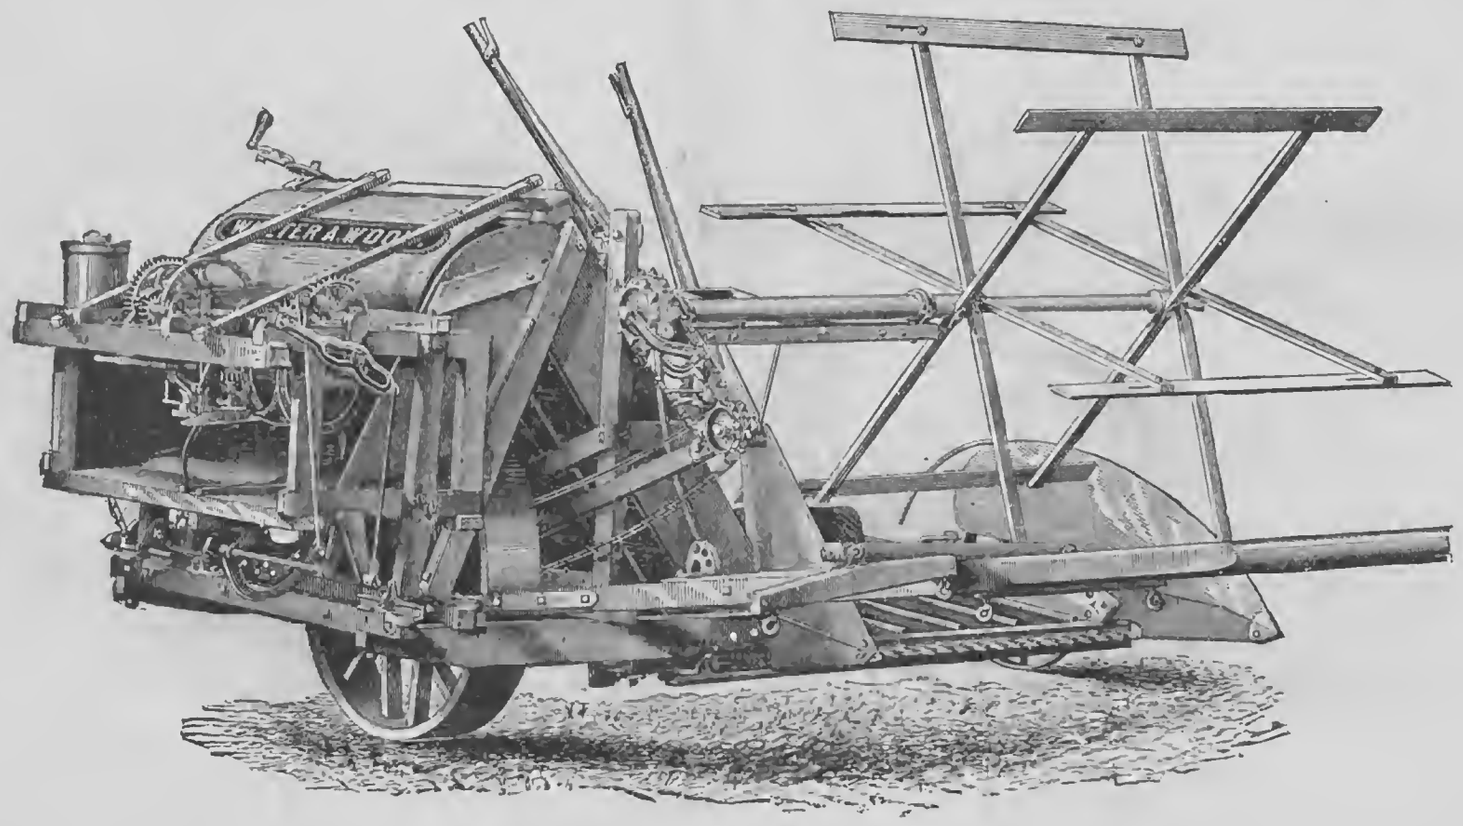
1852. **WALTER A. WOOD** 1880.

World-Renowned Harvesting Machines.

OVER 350,000 MADE AND SOLD.

THE WORLD'S HIGHEST PRIZES HAVE BEEN AWARDED THEM.

4,000 of these machines have been made and put in successful operation the past season. They have made a magnificent record of which any maker may well boast.



NEW

TWINE SELF-BINDING HARVESTER.

WALTER A. WOOD'S

The superior excellence and popularity of the **WALTER A. WOOD HARVESTING MACHINES** is substantiated by the fact that our manufacturing capacity is not large enough to meet the increasing demand for them year by year, notwithstanding our average annual production and sales have grown to exceed **Twenty-five Thousand.**

For the Harvest of 1881 we shall Continue to Manufacture

Self-Binding Harvesters, Self-Delivery Reapers and Mowing Machines,

Adapted to all conditions of Crops, and to all Climates.

MANUFACTURED EXCLUSIVELY BY

WALTER A. WOOD MOWING AND REAPING MACHINE COMPANY,

HOOSICK FALLS, NEW YORK, U. S. A.

FAY'S PROLIFIC CURRANT.—Fig. 302.

Horticultural.

CURRANTS.

It is something to rejoice over that this fruit is now beginning to enlist that interest which it has always been entitled to, but which it has never yet received. It is well known that the majority of farmers do not give their currant bushes any care whatever. They will bear any amount of neglect, and so they are neglected unqualifiedly. Usually, in spite of weeds and hungry soil, in spite of currant worms, and the decay of old stems that instead of being annually cut, are thus left to effect their own pruning, the bushes will yield a crop every season, and so the farmer contents himself with receiving something for nothing, and the profit and advantages of care and culture, and of a consequent quadrupled yield of fruit of larger size and better quality, are not considered. It is strange that those plants, no matter whether for the farm or the garden, which may be depended upon to yield more or less from year to year, are just those which many of us habitually neglect, while much of our time and care is given to less worthy, though more exacting crops, that get due attention because they cannot be raised without it. Thus—so to say—we neglect, we snub those whose services have been well tried and are assured, to lavish our favors upon fickle, squeamish strangers that will turn upon us with half a provocation.

There are in general cultivation, the Red and White Dutch; the White Grape and the Cherry or Versaillaise. We have among us a lot of horticultural politicians that at society meetings, and in fact upon every occasion that presents itself, waste a great deal of time over old, worn-out topics for no other purpose, it would seem, than that of making themselves conspicuous. One of these worthless topics is whether the Cherry and Versaillaise are or are not one and the same variety. The discussion, as has been shown, might continue till doomsday, and yet each would continue to hold his own opinion. At least, we have never known anybody to change his opinion from listening to such harangues. We beg of these omnipresent backs, instead of frittering away the valuable time of horticultural assemblies, to spend more time in their gardens testing new fruits, and thus prepare themselves to attend such gatherings with some information that will interest or instruct somebody.

There are many other named varieties besides those mentioned above, with which, however, we have naught to do at this time. Our most profitable kinds are the Cherry and Old Red Dutch. Given the same amount of care and culture, our own experience is that the latter is to be preferred, for the reason that it is better in quality, more productive and nearly as large. Under high culture, therefore, it is nearly the equal of the Cherry in all respects, surpassing it in some; while under neglect it is in all respects its superior.

For several years past we have heard of persons who were experimenting with seedling currants—some of them said to be crosses, some self-seedlings—and that a number of them were evidently far ahead of any of the well-known kinds. Not, however, until six weeks ago have we seen any specimens that seemed to justify such assertions. At about that time Mr. Geo. S. Josselyn, of Fredonia, N. Y., sent to the RURAL office a box three feet long, snugly filled with branches and fruit of a new variety of red currant, that has been named "Fay's Prolific," of one branch of which our engraving upon the first page is an almost exact reproduction. As will be seen, it is hardly possible for currants to be more thickly clustered, while in quality they were equal to any we have ever tasted, and in size fully as large. The drawing was made at once, but a pressure of other matter has prevented us from placing it before the reader until the present time. We quote from Mr. Josselyn's letters:

"I hope you received the specimen of currant, and that it will meet with your approval. I should be glad to know your views on the subject, as I am heavily interested in it financially. The crop is simply wonderful—bushes pulled to the ground with the weight of the fruit. We are getting extra prices for the fruit, and I do not see how it can fail to be a success."

"Mr. Lincoln Fay, of Portland, Chautauqua County, N. Y., is the originator. Mr. Fay is an enthusiastic fruit grower, and during the past 30 years has continually experimented with seedling currants, this seedling, being the only one of many thousands retained. 'Fay's Prolific,' is as large as the Cherry Currant, of rather better flavor, and *four to five times as prolific* as the Cherry. The fruit has sold in Buffalo markets during the past season for 15 cents per quart when no other variety was bringing more than 10 cents. To use the words of those who vended them at these places, they were the 'wonder of the market' This seedling is supposed to be from Cherry and Victoria Currants. It has never been offered for sale, but was originated nearly 15 years ago, and for the past eight years Mr. Fay has cultivated it alongside of all other popular varieties for market, and he is now abandoning all other sorts and using 'Fay's Prolific' in their place. These facts are well known by numerous fruit-growers and fanciers in this vicinity who have also beheld for several seasons the bushes loaded with fruit so that the branches were necessarily tied up to stakes. Plants will be offered for sale during the Fall or Winter of 1880. Sales of the plant are under my exclusive control."

We forwarded a proof of our engraving of Fay's Prolific to Mr. Josselyn, to which he replied as follows:

"Your cut is magnificent. I shall not grumble at whatever you may say. The currant is not a new thing. It has been fruited eight years, and I could furnish a hundred affidavits from nurserymen and others engaged in small fruit culture, which would place the plant beyond anything I have claimed. One of our best men of this class said to me on Saturday 'No amount of printer's ink can advertise your currant as it would be could you bring those interested, and let them see the acres in bearing.' This is precisely the case. I appreciate your position, and have such an opinion of the RURAL and those connected with it that I would not ask or wish you to do or write anything not entirely consistent with the facts in the case."

In conclusion, we beg to state that we never permit our advertising interests to influence us to the smallest extent one way or the other when an expression of opinion is called for regarding the value of any new fruit or plant whatsoever. In truth, we are only too glad to aid in the dissemination of new improved varieties, while, on the other hand, we freely take the liberty of condemning those which from our own tests we have found wanting.

NOTES FROM THE RURAL GROUNDS.

New Grapes.

The canes (two) of Lady Washington have this year made a growth of ten feet. The vine bears one small bunch, the berries of which began to ripen August 25. We have two vines of Eldorado growing within 100 yards of each other. One of them set fruit freely, which, as heretofore, rotted, the berries falling off one by one until not one was left. The other bears three bunches, every berry of which is sound. They are as sweet as honey, with a firm, though not thick skin. Instances of this kind show how easily one can do injustice to a new fruit under trial. Judging by one of these vines, we should pronounce the Eldorado a failure in these grounds, while by the other we should form a favorable judgment. Evidently a longer trial is needed here before we can either say that this grape is or is not adapted to the soil and situation.

The Secretary, as usual, bloomed and set heavily, and, as usual, the bunches up to the time of ripening were long and well filled. But the berries vary from medium to very small, some of them rotted; while those that remained ripened with so little uniformity that there was not one perfect bunch in all. Newburgh bore three bunches which began to ripen August 25. The leaves are rather small, though the canes are strong. The bunches are long, like those of Secretary, but the berries variable in size. Quassaic we have had for four years. The leaves burn and the canes grow feebly. It has not yet fruited. Highland, that we have in previous years reported upon unfavorably, is this year bearing splendidly. The bunches are large, heavily shouldered, and the berries plump and sound. At this time they have barely begun to change color, so that it may be feared that the season here is not long enough for them to ripen fully.

In the Spring of 1878, Mr. Miner sent us half-a-dozen of what he believed his best seedlings saved from thousands which he had raised from the Concord. From what he himself said of these grapes, as well as from the specimen bunches he brought with him to the office for us to taste, we have been hopeful that some of them would prove for general use a good step in advance of anything at present cultivated. Three of them fruit this season, and one of these (Victoria) is so praiseworthy in all essential respects that the hope above expressed is strengthened into belief. The vine is strong and healthy, the leaves large, resembling those of the Concord. It bears 15 large bunches of white grapes—all of them compact and free from the least blemish. The berries are as large as those of Concord, globular in form, with thin but firm skin, covered with white bloom, and of a sweet though sprightly flavor. It ripens with the Concord. This grape was illustrated in the RURAL NEW-YORKER, September 30, 1876, from a specimen bunch sent us by Mr. Miner. It is so accurate an engraving of our average bunches that a drawing of one of them would be little more than a reproduction of that. Salem, Martha, Goethe, and Wilder (Rogers's) are bearing abundant crops this season of their large, showy berries. They are not of the first quality certainly—but, really, we must say that, "taken all in all," their merits are singularly set aside for a consideration of the claims of the many newer kinds, most of which will be found less satisfactory to the grape growers in general. Such at least is our own experience.

Peaches.

JARRELL'S LATE WHITE was sent to us by the Messrs. Hance, of Red Bank, New Jersey, four years ago. It bears this season heavily. The peaches are extra-large—the flesh is white, fine-grained, juicy and excellent. It is a free-stone, and ripens from the 25th of August to the middle of September. This originated with C. E. Jarrell, Hillsboro, Md., and is, so far as we can discover, a fine variety in every way.

LEATHERBURY'S LATE.—This, from the same nurseryman, is of rather small size, red skin, mottled, and covered with a heavy down, orange-colored flesh, nearly free-stone, and not very juicy. It is heavily laden with fruit, which ripens this year about September 15.

TUCKAHOE LATE.—Medium size, red and yellow skin and flesh. It is of fair quality, juicy and productive.

SLEEPER'S DWARF.—This is, indeed, a Lilliputian variety. Our tree has been well cultivated for four years. It is very thrifty and handsome. It is about four feet high, and may be considered an ornamental shrub. It has borne no fruit.

HANCE'S WEEPING PEACH.—This is worked upon a stock six feet high, and the branches grow directly downwards, almost hugging the stem. Its weeping habit is all that there is to be said about it.

Plums.

BASSETT'S CURCULIO PROOF PLUM "AMERICANA" bears this year a heavy crop. Some of the branches are fairly wreathed with these little plums, though hundreds have fallen to the ground from curculio injuries. Whether it has been because there are fewer curculios this season, or more fruit of all kinds to divide their attention, certain it is that the plum trees of the neighboring country have borne and ripened their fruit better than for many years past, so that no more in this than in other seasons can the Americana's claim to being curculio-proof be granted. Even if otherwise, this plum is so small and harsh that we should regard it as scarcely worth cultivating even for culinary purposes.

NEWMAN.—The flesh of this plum is perhaps no better than that of the Americana, and the tree is not in these grounds very prolific. If tough skin and hard flesh afford any protection against the curculio, this should be well protected. The fruit resembles at this time a handsome crab apple, being splashed with bright red upon a waxy-yellow ground. As they ripen the entire surface becomes crimson.

LANGSDON, is in quality, size, appearance and time of ripening (September), so nearly like the Newman that we need at this time make no additional notes regarding it. Both are, no doubt, varieties of the Myrobolan.

Lady Elgin Crab.

Among the best varieties of crabs of which we have any knowledge is this. It is of large size, beautiful appearance, being of a fair, light-yellow skin, with a bright, carmine cheek. The flesh is firm and juicy and entirely free of the astringency of the crabs in general. It is very prolific, the fruit hanging in clusters of from three to six. The tree is regular and shapely in its growth and it is really one of those handsome and fruitful little things that both attract the eye and engage the affection.

Tomatoes.

For the purpose of comparative tests, we have as usual cultivated every kind of tomatoes this season, which has been much talked of or advertised. Nearly all of them, except the Turban, seem to be selections from the Acme, from which they differ so unessentially that there is little to be said about them. The characteristics of the tomato, like those of corn, seem to be so communicated to the seed that careful selections will generally perpetuate them in a greater or less degree, while two or three years serve to establish new varieties, which will come quite true to seed unless cultivated in too close proximity to other kinds. Variation in color, however, often occurs and we have this season Acme tomatoes some of which are partly, others of which are entirely, of a golden color. These come from the seeds of a tomato of last year, which, as we have already mentioned, was half red and half golden. As the summary of our season's tests with tomatoes, we have to report that the Acme from our selection of seeds is much improved in size and in productiveness over last year and that, in our estimation, it is still, by all odds, the best tomato.

Potato Beetles have never before given us the annoyance of this season. As if a new brood hatched out weekly, persistent applications of poison have failed to subdue them. Now that the potato vines are dead they have attacked the tomatoes—not the vines, but the fruit—some of which are literally covered by these irrepressible, disgusting, voracious vagabonds, whose feast, no longer seasoned with London-purple or Paris-green, is, no doubt, one of unalloyed satisfaction.

Grape Vines and Potatoes.

Last Fall a plot of sod ground (20x20 feet) was dug out to the depth of 18 inches. The sod was strewn over the bottom—the earth, which consisted of sand and gravel, carted away. A layer of long barn-yard manure was spread over the sod three inches deep, and muck from a meadow occasionally overflowed by salt water was used to fill in the rest, being stamped down as the work progressed. Red-cedar rustic arbors were then built, and six young grape vines were planted—two to each arbor. Two of them were seedlings of our own. One of these has made a growth of six feet, the growth confined to a single cane—the other, also confined to a single cane, has grown 10 feet. Concord—the third—has two canes, one of which is 12 feet long, the other eight. Brighton—the fourth—has two canes, each of which is 10 feet long. Moore's Early—the fifth—one cane—has made a growth of 11 feet. Woodward No. 1—the sixth—confined to one cane, has made a growth of 18 feet. All are in good health and, as will be seen, have made an unusually fine growth, except our two seedlings which will probably prove to be comparatively feeble-growing kinds. Now, in this same plot, we planted very carefully, a row of potatoes cut to single eyes, June 1st, sowing in the drill half a pound of potato chemical fertilizer. The variety, though not yet offered for sale, is one which we know to be remarkably productive. Every piece sprouted, though very slow in doing so; grew to the hight of one or two inches and then gradually dwindled away and died. We are left to infer that the soil and manure upon which the grape vines flourished so finely were not well adapted to the needs of potatoes.

POT-GROWN GRAPE-VINES.

In the RURAL NEW YORKER of Aug. 24th, allusion is made to our saying that we were the first to offer the native grape-vines in pots, and in the reference to Dr. Grant having grown them 20 years ago, the impression is left that it was done by him before it was done by us. It is now over 30 years since I first began business in Jersey City, and I think there are yet men living who bought Isabella and Catawba pot-grown grape-vines from me as early as 1850, and from that date I have ever continued to grow them in that manner, believing it to be not only the most rapid, but by far the quickest method to obtain fruiting plants, and were I to grow a hundred acres in this latitude, I would adopt no other method.

The reason why so much dissatisfaction was given by those Dr. Grant and his co-laborers grew in this manner, was that they propagated from the young, green shoots of the vine in the Summer season, which, of course, quickly enfeebled the constitution of all weak sorts; the Delaware in particular was so weakened that it took years to get it up to its normal condition. Our method is the usual one—to grow from single eyes, put into the propagating bed, (under glass in April); in a month they are rooted and twice shifting gives a plant six feet high by October; which when planted out the succeeding season, will make a growth, at 18 months from time of propagation, equal to that made by one twice that age, if not pot-grown, for the reason that no check is given to the roots in removal; every fiber being intact when pot-grown.

The "Cream" of the Strawberries.

In your issue of Sept. 4, you do us the favor to allude to our circular giving colored illustrations of what we consider the "cream" of the strawberries, and seem to wonder at my having changed my views of what is the "cream." Don't you think, Mr. Editor, that the cream of strawberries or any other fruit should continue to get richer? If not, why should we be deluged with a hundred claimants every season as "improvements"? Our practice is to grow all that we have reason to believe are good, and in our annual tests, select each year an assortment of six or eight which in our opinion (we do not claim it to be infallible) are the "cream" of the lot. We maintain that our colored plate of those named this season, represents as good portraits of the originals as art can well make them, your opinion to the contrary notwithstanding. PETER HENDERSON.

CHAMPION AND WINDSOR CHIEF STRAWBERRIES.

By the RURAL of August 28th, I observe our mutual friend, Mr. T. T. Lyon, takes exception to my remarks concerning the identity of Champion and the so-called Windsor Chief Strawberries. He says: "If he means that they are not only similar but *identical*, or, in other words, that the alleged parent is really doing duty as offspring, I cannot avoid a feeling that he ought to sustain such charge by fact or facts beyond the circumstance of even entire similarity." It is now admitted by various close observers of repute that there does not exist a shade of difference in any particular whatsoever between the two varieties. It is known the Champion is a pistillate or imperfect-flowered variety, and to produce fruit or seeds, *it must be fertilized by some other variety*—hence any progeny from it must be a *cross* between it and some other variety. Did any one ever hear of a cross being entirely like one parent in every respect? Is such a thing possible? This is but circumstantial evidence,

It is true, yet many are they who have been condemned to death on such evidence. Could there be evidence of the kind stronger or more conclusive?

Some of the "charges" that have been *fired* at the writer respecting the Windsor Chief, have *sounded* so humorous, that a brief reference to them may not be amiss. When I first published its strikingly close resemblance to the Champion, I soon heard a report fired by a "Big Gun" in New York State. In purport it was this: "He has not the *true* Windsor Chief!" At any rate I received my plants direct from the grounds of Mr. Gardiner, the professed originator. Shortly another came from a different quarter. That was: "He has a small lot of Windsor and a big lot of Champion plants, and he wants to make the Windsors sell his stock of Champions"!!! The truth was just the reverse, for from the high encomiums bestowed upon the Windsor, I took it for granted it must be something of great merit, and in consequence planted it largely, while it so happened I planted but few of the Champion. I had, therefore, in reality at least four plants of the former to one of the latter.

But these and many like statements clearly showed me there were others who had invested largely in the Windsor also. The only difference was they were more liberal (?) than I, and instead of being willing to pocket their loss, they wished to *share* it with others. It may be well to add that these remarks are not intended to reflect in any way upon our Western friend, who is far above such littleness.

J. T. LOVETT.

Farm Topics.

WESTERN FARMING.—XIII.

W. I. CHAMBERLAIN.

Bonanza Farming.

THE thing that most impressed me in the Dakota wheat farming described in No. 12 of this series, in the RURAL of August 21, was that no fertilizing matter is returned to the soil. It would seem to be only a question of time, therefore, how long that style of farming can last. On these immense farms, as at present managed, it seems well-nigh impossible to make any return. I talked freely with several of the large farmers along the Northern Pacific Road, including Mr. Dalrymple, and they all seem to feel not only as I have last said above, but also that the final exhaustion of the soil is inevitable, and that it is only a question of time how soon the point will be reached when this style of farming shall cease to be profitable. Whenever that point is reached, these large estates will probably be divided up and sold to "small farmers" who will begin a system of mixed farming with a view to making returns to the land for the heavy drafts annually made on it.

I think it is Dr. O. W. Holmes who tells of the first time he had funds in bank, and a check-book at his elbow. All went glibly enough till one day a check came back indorsed by the cashier or teller, "NO FUNDS." He uses the illustration in a literary way to show that he who constantly writes for the press without constant reading, study, thought, growth, will in time, surely run dry, or, as he expressed it, "have to *get the pump to help the cow.*" But the truth so tersely put by him, is just as true in agriculture as in literature, banking or dairying. Nature has made vast deposits of fertility in our great Western plains and prairies. But it has taken her scores of centuries to do it. Shall we be thieves enough to exhaust it in a single score of years? Shall we be so unjust to posterity? Shall we draw out the whole deposit, until nature shall refuse to honor our drafts and return them to us indorsed, "no funds?"

I know this is the strong temptation in the West. Repeatedly while I was traveling in Illinois recently, farmers said to me, "How is it that you Eastern writers are all the time talking about manure?" And I always answered from my firm belief, "You'll begin to write and talk about it too before long." Last week in a Western agricultural paper an Illinois man almost deplores the fact that he has got to draw out 100 loads of manure before he can put in his Winter wheat! I wanted to comfort him by telling him that on the writer's little farm of 130 acres, we have just finished applying over 400 loads of *home-made manure* to our Winter wheat ground. On this manure question at the West I am sure we shall soon see "a change come o'er the spirit of their dream." Even in immensely fertile Illinois, where on millions of acres Nature has deposited black, rich earth to the depth of *three feet* before you reach the clay, even there I notice that on the best farms the corn is fed on the place to cattle and hogs, and that clover and Timothy follow corn and other grain in suitable and wise rotation. And these farms are best *because* the fertility has thus been wisely retained and developed in the soil. But where corn has followed corn for a series of years and been *sold off of the place*, the productiveness has greatly diminished. Ohio, with originally not so rich and deep a soil, has been through the same experience, and been forced to enter on a recuperative system of agriculture, and to-day our crops, especially our wheat, among our best farmers, are far better than they were twenty years ago. Last year there came up to the State Board of Agriculture well attested yields of over 40 bushels of wheat per acre from nearly every county in the State. Ohio is yearly increasing her fertility.

Now, what is the lesson of all this for the Dakota wheat farmers? Successive crops of wheat exhaust the land even more rapidly than corn, and not even all-fertile Illinois, with soil and climate especially adapted for corn, can stand corn forever. How, then, shall Dakota stand wheat after wheat forever? It goes glibly now. Why shouldn't the farmers make money? They have fallen heirs to an almost priceless heritage of fertility. They are drawing funds from banks that it has taken many, many ages to deposit there. They are taking a rich heritage and apparently not caring whether they leave a rich one to their successors or descendants. They are repeating the old blunder that has followed the march of population from New England westward, viz: to suck the life from the virgin soil and then hasten on to newer lands beyond. Northern Illinois and Iowa have already almost ceased to produce wheat profitably, and Wisconsin and Minnesota are fast coming to the same fate apparently. And if Dakota is bound to follow the same ruinous policy, and raise wheat after wheat indefinitely, burn the straw in piles, raise no grass and keep no stock, why then we might almost say the sooner the chinch bugs come and force a change of agriculture, the better it will be.

But will grass and clover and vegetables grow, and cattle thrive, and men live in Winter in such a climate as Northern Dakota? Or must men own large farms and go in Spring with troops of men and teams, and skim the earth of another crop of wheat each year, and retire to warmer climes in early November? Is that cold climate likely to be settled up with thrifty and contented farmers, like Ohio or New York? On the whole I think yes, but must say why at another time.

Field Crops.

WHEAT CULTURE AND EXPERIMENTS.

PROFESSOR I. P. ROBERTS.

THOROUGH preparation of the soil and liberal application of fertilizers during the last few years by the few advanced farmers, are having a marked influence in the New England and the Middle States. In this immediate locality these pine and hemlock lands thirty years ago were considered poor or second-rate wheat soils; to-day it is not uncommon for entire fields to yield thirty, forty and even fifty bushels per acre. This is not due solely to the use of phosphates, for some of the largest yields have been obtained on lands treated to a light dressing of farm manures or on clover leas without extra fertilizers. Better preparation of the soil by improved implements of culture and better knowledge of the requirements and habits of the plant have been the largest factors in the good work. An average wheat soil has locked up, more or less securely, plant food sufficient for from 100 to 200 crops of 25 bushels per acre. The science of wheat culture consists in tickling this soil with the plow and cultivator until the myriad months that have swallowed up the fertility of ages are set wide agape, while the grain filches from their stony teeth the golden setting.

Fifth Continuous Crop Without Fertilizers.

So thoroughly persuaded have I been for years that *early* plowing and *thorough* surface culture were the true preparation for Winter wheat that in 1874 I began a series of experiments in order to gain more accurate knowledge. The land selected was a stiff, poor clay, which had produced an inferior crop of oats in 1873, and which had been in Blue Grass for at least three years previously. The land was thoroughly summer-fallowed in 1874. On a portion of this land no fertilizers of any kind have been used up to the present time. The land was summer-fallowed again in 1879.

	bu lbs.
Season poor, 1875	7.54
Season fair, 1876	18.27
Season superior, 1877	31.42
Season fair, 1878	31.51
Season fair, 1880	31.00

This series of experiments will now be discontinued, the object being not to exhaust the soil but to determine the effect of superior culture practically applied to poor clay soils. The summer-fallows of '74 and '79 consisted of three plowings, the last one about the first of August. After that date the harrow, roller and cultivator were freely used. The other years the land was plowed but *once*, usually the day after the grain was cut, the wheat being drawn off and shocked on adjoining ground. It was then left for about two weeks; after that the harrow, roller and cultivator were frequently used.

Experiment in Wheat Culture, 1879-1880.

Land clayey; summer-fallowed in 1879. The four preceding years the land had produced annually a fair crop of wheat. All plots, except 13 to 22 inclusive, in the four years had received no fertilizers. The preparation of the soil was similar to that described above.

No.	Yield per acre. bu. lbs.
1. 250 pounds Dead-Sure phosphate	30.00
2. Nothing	31.00
3. 200 pounds sulphate of ammonia	24.30
4. Nothing	35.40
5. 540 pounds D. S. phosphate	42.40
6. Nothing	33.00
7. 300 pounds sulphate of ammonia	32.50
8. Nothing	43.20
9. 180 pounds D. S. phosphate and 100 pounds sulphate of ammonia	44.40
10. 260 pounds D. S. phosphate and 200 pounds sulphate of ammonia	42.00
11. 14 loads manure—about five cords	45.16⅔
12. Nothing	37.30
13. Nothing, 1¼ bush. seed	37.50
14. Nothing, ¾ bush. seed	35.20
15. Nothing, 3 bush. seed	33.05
16. Nothing, 1⅛ bush. seed	25.55
17. 720 pounds plaster	33.00
18. Nothing	34.05
19. 50 bush. lime	27.00
20. Nothing	35.20
21. 720 pounds salt	36.35
22. Nothing	33.15
23. Every alternate drill vacant, 1 bush. seed, hoed twice	19.15
24. Broadcast	20.10
25. 360 pounds D. S. phosphate	38.30
26. 200 pounds sulphate of ammonia	28.40
27. 540 pounds plaster	23.25
28. 180 pounds D. S. phosphate and 100 pounds sulphate ammonia and 270 pounds plaster.	33.55
30. Nothing	29.45

The liability to errors in field experiments is so great from the variation of soils, depredations of insects, etc., that one year's results can very seldom be implicitly relied upon; but the average of several years of duplicated plots should reveal some reliable facts. Without trying to explain some of the seeming anomalies in the above table, I will leave the reader to gather from it such hints as he may, and proceed to give the average of the results of the experiments for the last five years.

Summary of Results.

Thick and thin seeding for five years:

	bu. lbs.
3 bush. per acre	25.19 4-5
2 bush. per acre	23.43
3 years, 1½ bush. per acre; 2 years, 1¾ bush.	23.46⅔

Comparison of all phosphated plots with a like number of adjoining unfertilized ones for one year (1880):

	bu. lbs.
Phosphated	38.36⅔
Unfertilized	34.28⅔

Comparison as above for five years:

	bu. lbs.
Phosphated	26.32⅔
Unfertilized	24.56

Comparison of all sulphate of ammoniated plots with a like number of unfertilized ones for two years:

	bu. lbs.
Sulphate of ammonia	23.44 2-7
Unfertilized	31.46¾

It is quite evident that sulphate of ammonia used in such liberal quantities as above, produces straw at the expense of grain.

Comparison of plastered with unplastered plots for four years:

	bu. lbs.
Plastered	25.34
Unplastered	26.59⅔

Comparison of hoed with unhoed plots for three years. The hoed plots contained the same amount of ground, but only half as many drills, and therefore half the amount of seed.

	bu. lbs.
Hoed	18.58⅓
Unhoed	25.10

Comparison of salted with unsalted plots for two years:

	bu. lbs.
Salted	28.30
Unsalted	25.47⅓

Comparison for two years:

	bu. lbs.
Limed	24.32⅓
Unlimed	26.12⅓

I judge from the above and from the unsatisfactory results from the use of phosphates that there is an abundance, and possibly a superabundance, of lime already in the soil. Our land is of drift formation; the timber upon it is pine and hemlock, interspersed with chestnut, oak and hickory.

Comparison for two years:

	bu. lbs.
Manured, 14 loads—about five cords	35.27⅓
Unmanured	35.50

Drill and broadcast seeding for five years:

	bu. lbs.
Drilled	25.48
Broadcast	23.23
Gain in drilling per acre	2.25

The peculiarity of this experiment is that for the five years during which it has been conducted, the drilled plots have given a nearly uniform yearly increase of two bushels over the broadcast sowing. A few of the results given above I am aware are of *local* value only; but most of them will, I trust, be of use in at least most of the State. After 20 years' experience and observation in wheat culture my advice to the young wheat raiser, in brief, would be as follows:

First—Manufacture and apply an abundance of farm manure; do not let it make itself, but attend to it as carefully as you would to the curing of cheese. If too dry, wet it; if too wet, dry it; if too hot, cool it; or if too cool, heat it, and do not let it leach, bleach or evaporate.

Plow early and, unless for special purposes, but once; usually plow *deeply*; you can hardly roll, harrow and cultivate too frequently.

Apply fertilizers on or near the surface and thoroughly mix them with the soil. Do not sow too early (but from 5th to 15th of September) and spend the time in unlocking plan-food by mechanical methods. Approximate as nearly as possible to the conditions represented in Fig. 1.

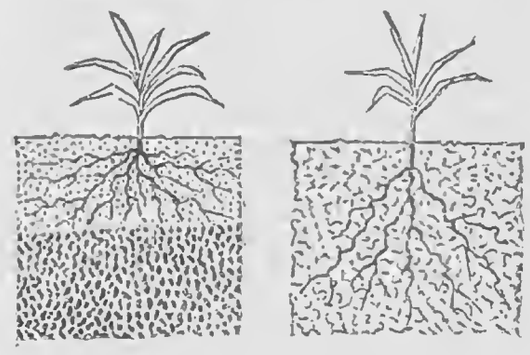

FIG. 1. FIG. 2.

FIG. 303.

Alternate freezing and thawing would certainly destroy the plant by breaking the roots if the conditions were as represented in Fig. 2; but if, as in Fig 1, little or no harm would be sustained, as the roots would rise and fall with the ground.

Use a drill; run it north and south; roll the ground before the drill, but never after except in the following Spring.

Do not try to raise two crops at the same time on the same ground, as it has never been an entire success. Therefore if you want wheat, sow wheat; if cheat, cheat. If you desire *good* grain, *sow good*, one and three-fourths to two bushels per acre, according to the size of kernel and tendency to tiller.

THE OHIO STATE FAIR.

[Rural Special Report.]

THE thirty-first annual Ohio State Fair was held in the city of Columbus from August 30 to Sept. 3rd inclusive. It was a success in every sense of the word. As an exhibit it has probably never had an equal in Ohio, and few superiors in any State. The total number of entries of animals and articles actually placed on exhibition was 5 300, and they varied in individual value from a few dimes each up to four or five thousand dollars, very many running above a thousand each both in live stock and machinery.

Under the last two heads the exhibits were especially fine. Of cattle there were 400 entries against 175 last year. Some of the finest herds of cattle in the land were represented, as well as some of the best of other stock, entries having been made not only from every part of Ohio, but also from N. Y., Pa., West Va., Ky., Ind., Ill., Michigan and Canada. The breeds represented, in cattle, were Shorthorns, Devons, Jerseys, Holsteins, Angus, Herefords and Galloways, and in other stock, all the leading varieties. The show of Shorthorns was magnificent, and the competition for prizes was very strong, but the awards were, I think, on the whole, just and satisfactory. The show of Jerseys was also fine, as this beautiful deer-like breed is rapidly gaining in favor, especially among amateurs or well-to-do villagers who are partial to cream and nice home-made butter for family use. The show of horses, sheep and swine was also excellent, as well as the display of farm products, textile fabrics, manufactured articles of all kinds, and of fruits and flowers and fine art exhibits.

But the show of agricultural machinery and implements seemed to surpass all. For example, there were 25 large, portable engines, entered for premiums and to propel other machinery on exhibition. All kinds of machinery were worked by them, from a portable sawmill, in actual operation, down to a thrashing machine, self-binder, or reaper, or mower. Several of these engines were of the locomotive or traction kind, and a parade of half a dozen of these self-propelling, living, moving monsters through the grounds, when the time for awarding premiums came, was a most interesting feature. The limit of velocity seems to be about six miles per hour, but they go up hill and down with ease, and draw the water tank and thrashing machine in the rear.

The machinery in Power Hall was run by a fine 75-horse-power engine furnished at a reasonable price by Lord, Bowler & Co. It was itself entered for a premium and took the first, a silver medal. It ran some pretty heavy machinery; for example, several tile and brick-making machines which were kept constantly in operation, using the same clay over and over again to show the crowd how the thing was done. It takes considerable power to grind the clay and run through a stream of ten or twelve-inch tiles. So far as I noticed, nearly all the machinery and implements were more or less *agricultural*, the furthest removed,

perhaps, being the middlings purifiers and portable saw-mills. The machinery was thoroughly and carefully examined by thousands of farmers. I do not think it true that our State fairs are degenerating into mere horse-races and places of cheap amusement. It certainly was not true of the one of which I am writing. For example, each *class* of stock—horses, cattle, sheep and swine—divided according to breed, age and sex, was led in its turn in to the show ring, to be examined, *standing side by side*, for the award of premiums. This is the usual custom at large fairs. The fact I call attention to is that a large crowd constantly surrounded these rings and examined these fine animals with care, and the point I wish to make is that the educational effect of such shows is by no means small. The incitement, too, to each farmer to breed better stock is great. On the last day of the fair, too, there was a grand parade of all premium stock on the race track in front of the grand stand, and it was a fine show and was witnessed by thousands of people.

Races at fairs are objected to by many people on moral grounds. The view of a majority of the Ohio State Board of Agriculture, however, seems to be that the breeding of improved roadsters is a legitimate branch of agriculture, and that the fairest test of speed and endurance is the race. Also that if pool-selling and jockeying are excluded, and no unfairness on the part of the judges is practiced, and the different races occupy only a part of each afternoon, there is no real ground of objection. That there was absolute fairness this year at least in intention on the part of the judges and of the "member in charge," all seem ready to admit.

Financially the fair was a success. The combined surplus fund of 1879 and 1880 amounts to nearly $12 000, and will be used by the Board in promoting the interests of Ohio agriculture according to their best judgment.

Sheep Husbandry.

SHEEP ON THE BLACK SOIL OF ILLINOIS.

B. F. JOHNSON.

A SHEEP breeder and farmer of some experience and reputation, having been requested to state the advantages and disadvantages of sheep breeding on the black-soil prairies of Illinois, and in what is known as the corn and cattle counties of that State, replied briefly in substance as follows:

Of the breeds handled about one-fourth are Merinos and their grades, one-eight mutton breeds and theirs, and one-half the common stock of the country. Within ten years, however, the English or mutton breeds and their grades have increased and the small breeds and natives have diminished.

Of the Merinos, about one-quarter are full bloods, with about the same proportion each of those more than half bloods, more than fourth bloods and less than fourth bloods. Of other breeds there are kept the pure Lincolnshires, Cotswolds, South-Downs and small Spanish Merinos. The live weights of each of these breeds are about as follows: Merinos, 30 pounds at 6 months, 80 lbs. at 12 months, and 90 lbs. full grown. Long-wools, 75 lbs. at 6 months, 110 lbs. at 12 months, and 150 lbs. full-grown. Middle-wools 60 lbs. at 6 months, 100 lbs. at 12 months, and 125 lbs. full-grown. The average weight of the unwashed fleeces for the fine-wools is five pounds, long-wools seven pounds, and middle-wools eight pounds.

The pasturage is nearly all inclosed and very few sheep are running at large; the pasturage being nearly as follows:—one-half permanent meadow or pasture land, one-quarter stubble, one-eighth Fall-feeding meadow, and one-eight wood land. The average permanent pasture is thought to be able to carry five hundred pounds of live sheep to the acre—the principal herbages being Blue Grass, Timothy and white clover, valuable in the order in which they are named. The average grazing or pasturage season is eight months and the feeding season four. Sheep are put on pasture April 1st, and turned off the last of November. Beyond the herbage of the permanent pasture, stock sheep get no supplementary rations between April and December, but for fattening purposes shelled corn is best.

Winter pasturage consists of Blue Grass and Timothy—the former being much the preferable for sheep. If Blue Grass and Timothy pastures or meadows are inclosed after the first of July and stock kept off till the first of December, and sheep are then turned on, stock sheep will go safely through a moderate winter, if allowed access to hay during storms and snowfalls of considerable depth. The average Summer charge for pasturing sheep is 15c. per month per head—and the cost of pasturage for the eight months of Summer is estimated at $1 20, and the keep for the four months of Winter at 60c. Of the grain fed sheep during Winter, three-fourths are corn and one-fourth oats; of the fodder one-half Timothy hay, one-eighth red clover, one-quarter corn fodder, one-eighth straw and a trifle perhaps of Hungarian. In the average Winter feeding of stock sheep, the consumption is estimated to be one and one-half bushel of corn, costing 40c., half a bushel of oats costing 10c., and hay and fodder costing 10c. more; total, as above, 60c. Very little linseed and no cotton seed meal is fed. In carrying sheep through the Winter, if the weather is dry and fine, the more grass and open air the better, and neither grain nor fodder is wanted. Where there is plenty of grass and stacks of hay or fodder to go to, the feeding of corn or grain of any kind is thought to be of no benefit to stock sheep. In bad weather, however, a supplementary ration of corn or oats is nearly absolutely necessary to keep the animals in good heart. As extra feed for ewes in lamb, there is nothing equal to well cured corn fodder.

When kept for wool the ewes are suffered to live to the average of about five years—the wethers one to two. For mutton, ewes are kept four years and wethers one to two. Sheep are generally neither yarded nor herded, but shade is nearly always provided for them against mid-summer heat. Herders are paid from $15 to $18 per month. Sheds are not provided for more than half the flocks, and these are built of poles covered with straw, or poles, boards and straw combined. The proportion of an average flock is about two-thirds ewes, and the average lambs for a hundred sheep are, for fine-wools 75, long-wools 75, middle-wools, 90, and natives 100. The lambs are mostly dropped between first of April and the first of June, but the earlier is the preferable, or near the first of March under the climate of Central Illinois. The average mortality of young lambs from exposure is about 20 in the 100, and five in the 100 from accidents. Of the surviving lambs, one-half go to the butcher as lambs. The weight of grass-fed lambs at four months is 60 pounds, and the average price is $4 each. The raising of early Spring lambs is occasionally made a specialty, and in that case, it is preferable to have them dropped in February. When ewes are bought, it is usually between August and October, and when disposed of for slaughter, they are sold in December. If one is desirous of starting a flock, there are sheep enough and of good quality enough to be found in the State, without the necessity of going abroad for them. Latterly in the selection of males for improving flocks, the Lincolnshire and the Cotswold are most in fashion.

The average weight of sheep killed for mutton is not far from 100 pounds, but when the large breeds are fed for slaughter, the average weight is fully 130 pounds. There is not much special feeding for mutton, but where engaged in, it is commenced about the first of December, and continued two or three months, the average gain being not far from 20 pounds, at the cost of not far from three bushels of corn, and fodder to match. The average price of sheep for fattening is not far from $3 for the hundred pounds, and the average fat sheep sells for about 4½cts. a pound, live weight. Nothing in the black soil and in the latitude of Illinois suits sheep so well as dry weather, both in the Summer and Winter seasons, and (*cela va sans dire*) in the Fall and Spring months too. Shelter is not generally provided and for the fine and middle-wools it does not seem to be so much necessary, but more so for the long-wools, though all breeds and all flocks would pay better were more care taken in providing shelter, especially against sleet and rain in the cold weather. Lincolnshires Cotswoods and South-Downs are considered the best mutton sheep, each breeder having his favorites, but the Lincolnshires do make the greatest weights in the shortest time.

The usual date of shearing is about the 20th of May and the average cost not far from 7c. for each sheep sheared. Twice shearing is never practiced, and the Fall fleece is unknown; Only about one-fourth are washed before shearing, and this is mostly done in streams, though a few use tubs. The usual lapse of time between washing and shearing is about one week, the average washed fleece weighing four, and the unwashed six pounds. The advantages of washing seem to be that when rightly managed, it is a healthy experience for sheep; but in the matter of the sale of wool, it makes no difference—a deduction of a third being made in price or weight of unwashed wool. Fleeces are usually done up inside-out and tied separately with twine—neatly tied fleeces selling from eight to ten per cent. more than those which are loosely and clumsily put up. The total wool crop is usualy sold at the farm, the demand being such there is no occasion to ship aboard on commission or consignment. The average proportion of wool to live weight in different breeds is found to be nearly as follows:

	Live weight. lbs.	Fleece weight. lbs.
Full blood Merino rams	175	13
Full blood Merino ewes	75	5
Half blood Merino rams	135	10
Half blood Merino ewes	75	6
Native ewes	60	4
Cotswold ewes	80	7
South Down ewes	80	7

The difference between the weights of fleeces often amounts to 25 per cent. between one year and another, and occasionally the high difference of 50 per cent. is noticeable, between one year remarkable for dry and fine weather all through, and another year equally remarkable in the opposite direction. Fleeces are always lightest after wet and cold Winters and heaviest after a long, dry Summer has been succeeded by a Winter equally dry, but in which there has been no weather of a very intense character. The tendencies in breeding in Illinois now seem to be in the direction of substituting the mutton for the small fine-wool breeds. Within ten years the average fleece has increased from 3½ to six pounds, and if wool has lost in fineness of fiber, it has gained more in yolkiness of fleece. Besides, the average carcass has increased from 60 to 100 pounds; there has been a corresponding gain in compactness and roundness of form, the constitutional vigor of the animal has very much improved, and the average sheep of Central Illinois has been changed from an insignificant, little, bare-bellied, and bare-legged creature, weighing 50 to 60 pounds, to full and half-bloods averaging from 100 to 120 pounds. The development of the wrinkles or folds on Merino sheep is encouraged only by those purists who consider these marks as characteristic of the breed. One way or the other, breeding them on or off appears to have no effect on the health or constitution of the individual or flock.

The crosses preferred for the improvement of Mexican flocks are the French Merinos; for natives the Cotswolds; for grades, the Lincolnshire. In selecting sires for cross-bred flocks, the local preference is for Merino ewes and Lincolnshire rams; for native ewes, Cotswolds; for Mexican ewes, French Merinos. In the matter of crossing the different breeds, the best results have been found when Lincolnshire bucks have been bred to the South Down ewes, and Cotswold bucks to French Merino ewes.

In respect to the introduction of sheep into this portion of Central Illinois, the farmer and breeder who is responsible for these statements says, about 1850 large flocks of Spanish Merinos were shipped into this County (Champaign) from Pennsylvania. They ran out the native sheep or at least fully supplied what demand there was for them. They were small and bare-bellied, weighing between 50 and 60 pounds, and were badly diseased with the scab. About ten years ago the South Downs and the Cotswolds were shipped in, and the Lincolnshires subsequently, from Canada. The bucks of these breeds being crossed with the first importation, almost all signs of it have disappeared. As for disease there is little or no scab at the present time; when it existed tobacco water was thought to be a perfect remedy. And there is neither foot rot nor liver rot enough to call for antidotes or remedies for either. Indeed, sheep are very healthy, there being neither grub in-the-head, nor abortion, nor *rabies*, nor madness from the bites of mad dogs, or other wild animals. In conclusion, the advantages for sheep raising in the corn or cattle counties of Illinois are at this time so great, that with capital sufficient for starting the business, a thorough knowledge of it from first to last, and a proper exercise of that knowledge, any reasonable investment would be pretty sure of returning from 33 to 50 per cent. per annum, so long as present rates of wool and mutton were maintained.

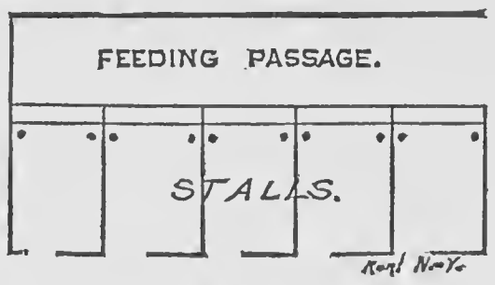
Dairy Husbandry.

THE DAIRY COW—NO. 7.

HENRY STEWART.

How to Lodge Dairy Cows.

COMFORT, cleanliness and quiet are important factors in that result for which the dairyman works—a pailful of milk; and these may be secured without sacrificing cheapness. A herd of cows may be lodged in the best manner, at a cost of $10 per head; that is, a most comfortable and convenient shed for 15 cows may be put up complete for $150. Elaborate building are all very well for the farmer who has no need to work for a living; but the business dairyman must look carefully to his investment lest he may have no profits to care for.



COW STABLE.—FIG. 304.

After many years' experience with all kinds of cow stables, I consider separate stalls for the cows ranged in a long, narrow, low shed, to possess the most advantages. It is difficult to have every desirable feature in one thing; but in such sheds as I am about to describe, one has economy, convenience in every way, absolute safety (which is a very great point), room, warmth and every other attribute of comfort for the cow. The shed which I consider the best can be built for $1 50 a running foot and 100 feet will give 15 cows a separate, roomy, loose stall for each, in which the occupant cannot be injured by horns, robbed of her food, or trodden upon and damaged in the udder or teats, and can be left at night with absolute certainty of safety. Even from fire there is the greatest possible safety, for as the cows may be left unfastened at night, each may be turned out by merely opening the door. A stall 6½ x 8 will be large enough for any cow, and 15 stalls will require 100 feet in length and 14 feet in width. A plan of a range of sheds is here given. The size is as above stated and the plan is drawn to scale of 16 feet to one inch. In front of the cows is a wide feed passage through which a light-wheeled feed truck may be taken and the fodder distributed very easily and conveniently from a feed-room where it is prepared.

The shed may be attached to a barn from which the fodder may be brought already prepared, or the end stall may be used for a feed room. In this case it will be found very convenient to have a cistern supplied by the rain water from the roof, and a pump, under one end of the shed. The stalls are divided from the feed passage by a partition six feet high, or, which is better, to the roof; a hanging door in front of each stall serves to introduce the food into the feed troughs, and, if the partition is made to the roofs, slide doors as large as half the space, should be provided for ventilation and for other obvious purposes. The rear of the shed should face the north, and should have a row of hanging shutters along the whole space to be opened in the summer time, if the cows are kept up at night.

The sheds should be built upon high ground to give ample drainage and as the production of manure is of great importance, it will be found of the greatest value to keep the stalls abundantly littered and cleared out only when necessary for cleanliness. The manure may be left three or four days at any rate, if plenty of short litter or absorbents is provided. The partitions between the stalls are double-boarded for safety, and five feet high. A post or long iron staple will be required in each stall at each corner, as marked by the round dots. To these are attached steel rings and short chains to go round the necks, or to hook on to rings in leather neck straps. It is best always to secure a cow when she is milked and it may be found desirable sometimes to put two cows in a stall, when this arrangement will be found useful.

Where room is not sufficient to give cows more than 3½ feet of floor room, stanchions will be found the best method of fastening. When cows are kept for profit one cannot well be too fussy about their ideas of comfort. A cow's idea of luxury and comfort is to be able to steal from her neighbor, to tyrannize over her, to punch her whenever she can, and to keep her in terror. I have found no manner of fastening so comfortable for the owner and the milker, so safe for the cows, and so comfortable for the weaklings and quiet animals as stanchions. I don't approve of cows licking themselves clean. I do that with the card and brush, and that they cannot do this is the greatest objection made to stanchions. From a desire to be as kind and humane to my cows as possible, I have tried all sorts of fastenings, but as I have concluded hereafter to consider myself first and the cows second, whenever I change my methods of fastening, I will use stanchions, or the loose stalls which I have found very convenient for my own purposes.

I do not intend to, nor can I in the space at my disposal, do more than give general principles for the lodging of dairy cows. There are a few indispensable points to consider in selecting any plan. These, or the most important of them, are economy of labor; economy of feed; ease of management; safety to the animals; comfort, first for the owner, and then for the cows; healthfulness, provided for by good ventilation, cleanliness, and sufficient room; and last, but by no means least, the making and saving of manure; and with all these cheapness and durability of construction and material are not to be lost sight of.

Farm Economy.

EVAPORATING APPLES.

The apple crop in this vicinity is the largest for many years. Picked and well sorted fruit sells for thirty cents per bushel. In consequence of this low price, many growers are turning their attention to evaporators. Evaporated fruit is very fine, and sells readily at good prices. But right here I wish to drop a word of caution to those persons who are contemplating purchasing driers.

A small evaporator that will evaporate five to ten bushels of apples per day, is too expen-

slve, takes too much time and fuel, and is altogether too slow to pay.

One that will evaporate 40 to 100 bushels per day costs comparatively less, can be run more economically as regards fuel and labor, and consequently pays best. After a series of careful experiments, I have come to the conclusion that only the larger ones will prove satisfactory.

As we find men will "exaggerate" in order to sell their goods, we should be cautious how we accept all the statements of people who have evaporators to sell. I have small circulars from manufacturers who state that one bushel of apples will produce six to seven pounds of dried fruit. This estimate is one-third too high. Such apples as are generally used for drying will only turn out about four pounds per bushel. Forty years ago the rule was "five bushels of green apples will make one of dried," and later experience proves the old rule to be not far wrong.

Two years ago I dried 50 bushels of ten different varieties, that were unfit for market, being under-sized, one-sided, bruised, etc., and the result was 220 pounds as sold in January. I had tried this before and have since, with just about the same result. Any one testing this for himself will (unless he has evaporators to sell) find that four pounds per bushel is the safest estimate when calculating the probable profits of investing in evaporators. The difference between four and six bushels will seriously affect the profits.

Of course, if we use first-class apples (which are hardly ever dried), the yield will be somewhat larger, but in no case will it exceed four and one-half to five pounds per bushel. If this is a fact, as I claim it is, it were better to know it before making any investments in drying apparatus. NELSON RITTER.

Onondaga Co., N. Y.

Scientific and Useful.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

"FREAKS" OF LIGHTNING.

YOUR recent account of the curious effect of a stroke of lightning upon the premises of Mr. Williams, of Montclair, N. J., exhibits, curiously enough, several of the so-called "freaks" which are very usually noticed in the erratic behavior of lightning. But electricity, of which lightning is but the visible effect, never performs freaks. Its conduct is exemplary in respect of its reasonableness. It does everything upon compulsion and by the force of the most infallible laws. The most surprising conduct of the lightning in this case was that it did not strike the house, and that it struck a low grape arbor, of which it shattered a post and cut the wire into short lengths. Now all this is seen to be most methodical and business-like when the reasons for it are understood; and it is of great interest that these should be understood, because then persons may know what to expect in a thunderstorm, and knowing the character of this powerful and, in most cases, mysterious fluid, they may pass through a storm without the usual feeling of apprehension or even horror, with which many persons are painfully affected.

Now, the truth of this matter is as follows:—Benjamin Franklin was the first discoverer of the identity of lightning with electricity, and therefore proved that the laws which govern electricity, as we can produce it in electrical machines, are precisely the same as those which govern the infinitely more intense electricity of nature. The truth is, the earth is a vast electrical machine, in all respects, excepting as to its incalculable power, similar to the toys which amuse boys and instruct men. The first great law of electricity is that, like all other fluids, it seeks a level or an equilibrium; not of gravity or surface, as in water, but of intensity. The next is that when the equilibrium is disturbed by an excessive production in one place, this excess flows to the place where the accumulation is deficient. Usually it flows silently and imperceptibly, without attracting notice, excepting to the scientific observer, with his sensitive electrometers or electricity measurers or gauges. This current flows through mediums which are naturally able to conduct it, and these are known as conductors, and some substances are good conductors, as copper, iron, and water, while others are bad, as glass, dry wood, air, etc. If the conductor is equal in capacity in every part, just as a canal might be for water, the current flows easily, but if portions of it do not conduct as well as others, just as if a canal were narrow in places, the stream is impeded, and an overflow or break occurs in these places; for the last law which need be mentioned here is that when electricity meets with a resisting medium it produces a quantity of heat proportionate with its intensity. Thus, when a cloud charged with electricity passes over a portion of the earth's surface where the equilibrium needs to be restored, a current is at once established. If the conducting medium cannot take it off fast enough, a sudden discharge is made, and this being through an unfavorable medium, great heat is produced and becomes visible as in lightning. It is not necessary here to refer to positive and negative electricity; these terms are used only to express the want of an equilibrium above noted.

Now, let us go to Mr. Williams's place and explain those freaks. The house was provided with lightning rods, and these do not carry off a stroke of lightning; they have not capacity enough for that, but they conduct the electricity in a quiet, continuous stream from the moist air to the ground, and the house is not struck. To do this is the only use and value of lightning rods. But the trellis post being dry wood was not a conductor, and being in the way of the forcible current, was struck by it, and the heat caused by the resistance produced such sudden expansion or explosion of the fibers or of the air contained between them as to rend them apart and tear the post to pieces. Then the current took the wires, which are good conductors, and the fluid passed through them. But no wire is perfectly even in structure, and faults in the material in making wire are repeated over and over again in the course of its length. When the fluid came to the parts where the conducting power was weak, the resistance caused heat, and this heat melted, and by its enormous power probably vaporized, the iron precisely at those spots, and so caused the wire to drop into pieces. H. STEWART.

LIGHTNING FREAKS.

IN the issue of the RURAL for Aug. 21, "Horticola" tells of "curious freaks" of lightning, and asks for a similar case, if known. I have met with a case so similar that I will state it.

In the Summer of 1878, about the last of August, we had here a heavy rain, accompanied with unusual thunder and lightning. The latter "struck" in more different places upon an area a mile in diameter than I ever knew of. An Osage Orange hedge, a mile and a half long, inclosing my orchard, was struck in several places widely apart. At such places the leaves were burnt to a crisp for a length varying from five to twelve feet. A privet hedge, making the first year's growth, had about 12 feet of one end burnt in the same manner. The west end, which was burnt, abutted upon a board fence running north and south, and the hedge was eight feet from, and ran parallel with, vineyard rows trained to wire on tall cedar posts, yet nothing showed any effects of the lightning except the hedge, which looked as if a sheet of flame had been spread upon it. My house has two stove flues coming out from the roof near together. One had a lightning rod attached to it. This one was, it would seem, lifted away from the roof, dropped to the ground, and the rod lifted from its fastenings and thrown back across the roof. No further damage was done to the house. At the same moment a door shutter was torn to pieces at the grafting house, about 40 yards away, and the pieces scattered in the yard, but no other mark of the "stroke" was left upon the house. About 50 feet from this door there was a shrubbery nursery in which several feet of one row of young shrubs were burned like the hedges already noticed. The effect upon the hedges and the shrubbery was only a loss of foliage; the plants lived, sent out new leaves and went on growing. In all this electric shower no person was hurt. JOT.

Greene Co., Mo.

Miscellaneous.

SHIPMENT OF FRESH MEAT ABROAD.

THIS is one of the most commendable enterprises of the present day and ought to be adopted exclusively in preference to the transportation of live animals, as it is not only the safest, but in the long run the most profitable. There are two methods of doing this, one of which is to slaughter the animals at the port where they are to be shipped, and stow the carcasses in refrigerated compartments of the vessel in which the meat is to be transported; and the other is to can the meat as near to the places where the cattle are bred as possible. This latter is the more economical, as the horns and hides of the cattle, the pelts of the sheep, and the bristles of the swine are then kept at home, where they are indispensable for various manufacturing purposes; while the offal of all can thus be saved and carried back to the soil to enrich it and thus prevent its being deteriorated in cultivation.

The transportation of animals on the ocean is accompanied with great cruelty and loss. Many who are engaged in it shamelessly disregard the former, and only care for the latter, as this lessens their profits, their feelings being only touched through their pockets. During the past year upwards of 310,000 cattle, sheep and swine were shipped from the United States and Canada to Great Britain, of which 14 024 were thrown overboard on the voyage, 1,249 were landed dead, and 455 were so much injured that they had to be killed immediately after landing. This is a terrible loss, it being about one-twentieth of the whole number. Where are the officials of the Societies for the Prevention of Cruelty to Animals, that they do not put a stop to this inhuman business? They have benignly regulated the transportation of animals on the land; why, then, should they not do the same on the water on both sides of the Atlantic? If they will not perform their duty in this respect, the municipal officers of the ports where the animals are shipped, and again where they are landed, ought to attend to it; and in case of inhumanity in the transportation, the confiscation of the animals would be none too severe a punishment to their owners. But in rough weather, which is always to be expected to a greater or less degree on every voyage, it is impossible to prevent suffering, so that the most humane and profitable way is to cease entirely from shipping live animals across the ocean for slaughter.

A FINE PLUM.—A specimen of the plum illustrated and described in full in our issue of October 4, 1879, has been sent us by G. H. and J. H. Hale, South Glastonbury, Conn. As then remarked, this plum seems to be a distinct variety, as it has not yet been identified with any other known sort. The branch is 18 inches long, and bears three plums 6¼x6¾ inches in circumference. Large, obovate; color reddish-purple with light-blue bloom. Stalk three-quarters of an inch long. Rather deep, narrow cavity. Flesh of an olive-brown color; stone nearly free. Very juicy—sweet and acid agreeably combined. An excellent plum.

A "LADIES' Grain and Provision Exchange" has just been established in Chicago, where ladies can speculate, apart from coarse men, in agricultural products. How is it we never hear of *Gentlemen's* Associations? The nearest approach to this kind of thing we know of is the "Gentlemen's Sons' Association" of this city, the existence of which is occasionally brought to public notice by the compulsory appearance of some of its members in our police courts.

CATALOGUES, ETC., RECEIVED.

CATALOGUE of the State Agricultural College of Kansas at Manhattan.

THE Autumn exhibition of the N. Y. Hort., Society will be held at Metropolitan Concert Hall, corner Broadway and 41st Street, on Wednesday, Thursday and Friday Sept., 22nd, 23rd, and 24th. Address, James Y. Murkland, Recording Secretary, 12 Cortlandt Street, N. Y.

HUBBARD'S RIGHT-HAND RECORD AND NEWSPAPER DIRECTORY, is the title of a complete list of leading newspapers all over the world with such information and directions as will enable advertisers to make some estimate of the direction to give their patronage. The book is neatly printed, the facts conveniently arranged, and it contains very much in small space. H. P. Hubbard, Advertising Agent, New Haven, Conn., is the compiler and publisher.

BRIEFLETS.

THERE has been a fatal duel in South Carolina. Isn't it bad enough to have railroad and steamboat catastrophes, without such distressing carelessness in duels?—Boston Post. . . . . The Husbandman says: "Farmers have such vital interest in purifying government and equalizing its burdens, that they cannot afford to be led by men who have no regard for their welfare." Very, very true. . . . . It is true that Clapp's Favorite is quite worthless if permitted to ripen upon the tree. But the same may be said of many others. . . . . *First-rate, cheap* things tempt purchasers. Hence the supply creates the demand. . . . . It is in this way that what were considered as dainties for which there was but a limited demand have become necessities for which there is always a brisk demand. . . . . Celery growers should bear in mind that nothing is gained by earthing up too soon. The growth is retarded. . . . . Mr. U. E. Thorne, the untiring farm Superintendent of the Ohio State University (Columbus), speaks a good word, in Farm and Fireside, for the Velvet Chaff wheat. It is extremely early in ripening; the straw is stiff and the head heavily bearded. The grain is of medium size but very plump and heavy—of a dark amber color and a peculiarly hairy brown chaff which gives the variety its name. It yields about the same in most places where it has been tried—as heavily as Clawson or Fultz. . . . . Mr. Thorne has never known Velvet Chaff to be affected by smut. Its flouring qualities are among the best. . . . . We have tried, side by side, grape-vines set out in the Fall and Spring. The former have made the more vigorous growth. . . Asparagus beds, as we have before noted, had better be prepared now. Our readers might during October prepare their plots for our Argenteuil and Dutch Asparagus seed. Make the soil deep and mellow. Then cover with farm manure to be spaded under in the Spring. . . . . We have labored very hard indeed to present our friends with an acceptable list for our next Distribution. If it fail to please them, we shall justify ourselves in feeling sadly disappointed. . . . . Which is the best variety of wheat? Nobody can answer that question. There is probably a larger quantity of Fultz and Clawson raised than of all other winter kinds together. But this does not prove they will yield most on any farm where they have not been tried. We advise our farmers to try small quantities of different kinds. Measure off a few plots 33 feet square, which is 1-40 of an acre. Sow broadcast or use a hand drill. This will aid you to answer the above question. . . . . All sorts of hardy vines and ornamental shrubs may advantageously be planted this Fall. A slight covering or mulch of straw or long manure will prove no detriment. . . . . .

WHAT OTHERS SAY.

EARLY OHIO POTATO.—"This is the earliest of all the American Rose type of potatoes, has of all the shortest haulm, resembles Beauty of Hebron in color of skin, but is rounder and turns out a much more even table sample. I strongly recommend this kind because I find it in table quality quite superior to all other Americans; indeed even now when boiled it becomes as floury as a Regent and quite as good. Its short top admits of its being grown in rows at 24 inches apart, and on a warm border it will, I am sure, beat all the Ashleaf Kidneys in earliness. It is not a new American kind, but has only recently been introduced into commerce here." We find the above in Gardening Illustrated, London, England.

WE find the following in the London Farmer. Always to take from the soil, never to give to the soil even the rest of nature, makes the most fertile land weak. American farming has taken the best out of the wheat soils of half a continent. What wonder that we are flooded with American grain? But when little new land shall remain to be opened up, and the average yield per acre on old land shall show a steady diminution, what wonder then if the United States should find their agricultural export pre-eminence to be slipping away from them?

AGAIN—TROTTING AT FAIRS.—A correspondent of the Maine Farmer says: "You may as well offer a premium for the best barrel of whiskey which is made of the grain that a farmer raises as for the fastest trotting horse. In point of fact, whisky and a technically 'fast horse' are equally useless and pernicious. So also of apples. Because farmers raise apples, and they are properly products upon which premiums may be paid, it does not follow that the making of good cider to be used as a beverage, and apple brandy should be encouraged by agricultural societies. The truth is, this horse trotting at fairs is simply gambling and betting, disguised under the thin veil of testing and trying the speed of horses of no earthly use to any one except those engaged in it, and an idle class which always assemble on any exciting public occasion. The thoughtful and serious farmers who would like to make the cattle show and fair an occasion to exhibit their good work, farm products and domestic manufactures, inspect that shown by others, compare notes with each other and learn something new and valuable, care nothing, as a rule, about fast horses any more than a sober merchant does about some monstrosity which an idle showman brings along and offers for sale or exhibition. The trotting for a purse of $50 is only gambling for that purse, and among the crowd of people are those always there who are betting their $5, $10 and $50 that this or that horse will win the race."

[If the agricultural press with one voice would persistently condemn this evil practice—evil in all its tendencies—trotting at "agricultural fairs" would soon become a thing of the past.—EDS.]

WORMS IN HORSES. To destroy pin worms in horses, give an injection of salt and water two or three days in succession, then administer a ball consisting of half an ounce of aloes and one drachm of calomel.—N. Y. Herald.

AS THE POTATO plant is propagated by its tuber, after the manner of a bud, or cutting, the effort made by the plant to produce its flowers and seeds must be a waste of power, which detracts from the desired crop—the tubers. We (Mark Lane Express) know an instance in which a six-acre field of potatoes was tested to show the truth of this postulate; three rows had the blossoms cut off and three rows were left intact, alternately all over

the field, and the produce of the rows which had been deprived of the flowers showed a very marked increase over that of the rows which had not been so treated.

MR. HALL is, according to the same journal, fully entitled to the distinction of being the largest dairy farmer in the United Kingdom, cultivating as he does over 2,000 acres as a dairy farm, and keeping seven hundred cows, a number which he hopes to increase to 1000. It is, however, more as a purveyor of milk than as a farmer that his success has been noteworthy.

THE profits derivable from farming are too small to admit of any lavish expenditure, and however energetic and spirited the management may be, if economy be not studied, the chief end of good farming—profit—will not be realized.

SUFFICIENT FARM HELP.—"Now if we start out in the Spring to till a farm of a certain number of acres without sufficient help, then a part of the necessary work must be left undone or the work only partially accomplished. Then is when the farmer has too much to do and gets behind with his work; neglect disturbs method and all things are soon out of balance. Many farmers say they cannot afford to hire much help. It is as necessary to have sufficient help to carry on a farm successfully as it is to have any help. If help can not be had, then let some other farmer have a part of the farm to work, for the extra amount of land which cannot be properly tilled is so much land lying idle." Thus writes a correspondent of the Husbandman. He then goes on to state his own method:—"I will give the method which I have followed for years, and I cannot say that I have had too much to do, and at no time have been behind with my work. The first thing I do is to provide the best tools for all kinds of work and sufficient team power to use them. I employ the best help I can get, as I have learned that skilled labor is the cheapest. Hiring cheap help to save a few dollars does not pay, loss in damage to teams and tools more than offsetting any saving so made. It takes but a few hours for an inexperienced or a careless hand to do much damage. It is my method to keep as much help as the farm requires. I am well aware that many farmers will say, as has been said before, that they cannot afford to hire so much; but all I have to say to such is, start next Spring with more help and till your land as it should be tilled, and put the farm in proper shape, and when the year comes round figure up the difference, and see if money has been lost."

CULTURE OF THE SOIL IN PUBLIC SCHOOL YARDS.—We are glad to find an excellent article upon this subject in the agricultural columns of the New York Tribune, the Editor of which is ever foremost in advocating any good cause:

The enormous growth of our population, and the little unoccupied area left for further free expansion should suggest the serious thought, whether we ought not to require—as other nations are doing by legislative enactment—that every teacher should pass an examination in the principles of soil and plant culture, and that practical lessons in these principles should be given in every primary school. It is a consideration that concerns everybody: and one that eminently deserves forethought and timely action, because years must pass before it can be carried into full effect. During these years all our really good soil will be occupied, and millions of our acres reduced by a thoughtless or ignorant management to a lower and lower state of production; while our forests, which require a century for recovery, will have been wholly despoiled.

Lately a yard was seen, not very large, where about 400 children daily play—in a railroad town with its full proportion of "street Arabs"—yet there have been for years growing in it a great variety of plants, vines, and trees, with a handsome flower bed gracing the front, all as safe as in any private grounds; the leaves unbruised and dense enough—in the case of one vine supported only by a stake, giving shelter to a bird's nest within the reach of all hands above ten or twelve, yet so secure that the young were safely hatched. No rules exist for the preservation of these plants, but there is an offer of a reward of $50, posted up for the conviction of the spoiler of a tree, outside on the streetway. No teacher betrays personal anxiety, but a feeling of pride and possession is gently instilled, and every plant in the yard becomes dear to each pupil. They are often subjects of pleasing and instructive talk and object lessons.

For lessons in soils, etc., it is a first requisite that our normal schools prepare teachers on the subject. There is as yet no good text book upon it in our educational lists. That the teachers must first be taught is the conclusion arrived at by the devoted Secretary of the Michigan Horticultural Society, Mr. Charles W. Garfield, who sent out circulars of inquiry last year as to the planting and conservation of school yards. There were many responses, but nothing practical or suggestive from teachers. Twenty pages of the Pomological Report of the society (1879) are devoted to an abstract of the replies. They are worth reading, and will no doubt prompt some practical action.

PARMESAN CHEESE.—In a paper written by Dr. Prato, in the *Annali del Agricultura*, the process of making this cheese is given as follows:—"The cows are milked by women and girls at evening, and the milk carried in wooden or tin pails to the cheese-room, a sort of shed inclosed with walls on two or three sides, and having in the center a furnace with its copper. The milk is measured, strained through a cloth, and placed in flat, shallow dishes ranged round the walls of the cheese-room. There is another delivery of milk in the morning, which is measured in the same way. When all the cream has been removed the milk is placed in the copper and raised to a temperature of 81 deg. Fah., which is considered best. The fire is then drawn, and rennet added. Natural rennet from the calf is always used. It is stirred in and left for an hour. Next the curds are reduced to a state of even and uniform comminution with the aid of a long stick provided with projecting points and a brush-like end of wire. This operation having been carefully performed, a small quantity of whey is added, and good saffron, in the proportion of half a drachm per twenty gallons of milk, is well stirred into the mass. The fire is again set going, the contents of the copper being now maintained at 113 deg. Fah., and kept well stirred until it is known by the feel that the cooking has proceeded far enough, when the copper is lifted out, and the contents are allowed to cool, so that the caseine may be precipitated. To facilitate the process a little cold skim-milk is added, and at the end of a quarter of an hour precipitation is complete. The curds accumulate in the middle, and are removed with a cloth. The cheese is lifted out in a cloth, and pressed under a thick wooden plate weighed with a heavy stone. When the whey is well squeezed out, the linen cloth is replaced by a hair cloth, fresh weights are added, and the cheese trimmed round from time to time. After this it is carried to the salting-room, where it is covered with salt. Here it remains three weeks, being constantly turned over and salted on each side in turn during that period. Lastly, it is carried to the drying-room, well scraped and brushed, and the surface oiled. The whey from the cheese is made into *ricotta*, which is eaten, either salted or baked, by the peasants instead of cheese. It is heated to a temperature of 176 deg., stirring constantly. A little fresh milk or butter-milk, or, if the milk be not sour enough, a little sour milk is sometimes added.

Everywhere.

NOTES FROM FLORIDA.

PEOPLE say this has been the warmest Summer known here for a great many years, the thermometer ranging from 88 deg. to 100 deg. most of the time. With the exception of three cool days and nights about the middle of this month, it has been one intense heat. We had a great deal of rainfall through July, but it came in showers, accompanied much of the time by terrific thunder and lightning, the atmosphere being so completely charged with electricity that I would often feel it in my hands and arms as sensibly as though I were holding a sponge connected with an electric battery. During one storm three pine trees were struck within sight of our house. After every shower it would seem as though the sun came out hotter than ever. We have had less cool breezes than usual and the only wonder is that everything is not completely burned up, and, in truth, everything that is not suited to just such weather has met that fate.

The orange trees like it, and have made a wonderful growth during the Summer. In this locality the fruit is not rusty and has not split and dropped off as much as usual. The Bermuda Grass on our lawn is fresh and green. Our Charles Downing Strawberries are in fine condition. I set young plants in rows two feet apart last March, sowed cow-peas between the rows to shade them, gathered a good crop of peas, and at the commencement of the rainy weather in July, cut off the vines and had the roots spaded in, the vines being too heavy to turn under during July. An immense crop of Crab Grass came up which I pulled up by hand three weeks ago, and had a liberal top-dressing of fine manure put on. Since then, until yesterday, we have had but one rain to wet the ground. You would be astonished to see how fast the runners are growing, the plants will soon cover the ground and unless we have frost severe enough to kill the blossoms, I shall have my table supplied with fresh strawberries from Christmas on through the Winter, or Spring, I should say, we do not call it Winter here after the first of January.

Planters are all busy picking cotton; it promises now to be unusually fine. No cotton worm has yet appeared in this county. If the crop escapes these pests, planters expect to make a heavy crop of cotton. Sugar cane and rice are also remarkably good. Early planted rice is about ready to cut, late planted is just beginning to head. There is said to be an immense crop of sweet potatoes put in in this section, the early ones sent to market, are very large. We feed our cows, pigs, dogs and cats on sweet potatoes. Many people feed them to their horses instead of grain. The darkeys will live on them, often eating them raw, and we often see white children eating them like apples; Florida cooks make pies, puddings, pones and bread of them. If the crop of sweet potatoes should ever be a failure here, I think there would be a famine.

It rained yesterday all day, the wind blowing furiously. This A. M. the wind has abated and it does not rain, but is cloudy and very warm with a prospect of showers. If it keeps on raining it will hurt cotton badly. It has rained all day only five days during this year, and this is the first high wind we have had, except little blows during thunder showers that would only last a few minutes.

Bradford Co., MRS. I. SUMNER

RURAL SPECIAL REPORTS.

ARK., Beebe, White Co., Aug. 30.—Cotton picking has now begun and the first bale was sold at 14 cents per pound and got $13 as a premium. A St. Louis cotton merchant, who has lately been traveling through the Lone Star State, says that the cotton worm working in the boll, is doing a great deal of damage there. Around here rust has struck the cotton and is injuring it very much, and the dry weather is also making all the top squares fall off badly. We can count only on the lower bolls for a crop. The prospect of a large crop put us all in fine spirits, but we can hardly count on that now. Late corn is very good; early corn was injured by the dry weather. It is now so dry that we cannot do any plowing, the ground is so hard. Eggs, 10c. per dozen; corn, 75c. per bushel; oats, none for sale; millet, $10 to $12 per ton. H. B.

CANADA, London, Ont., Aug. 31.—Fall wheat is now in and much of it is thrashed; the berry is good and the yield from 30 bushels upward as high as 50 to the acre. Spring wheat is very little grown here. Barley is light and colored. Oats are much rusted and light, having been beaten down by the storms. Of peas not many were planted on account of the bugs. More corn has been grown than in any previous year, and it is looking well. Potatoes are blighted, but there are not many bugs. Mangolds, turnips, carrots, etc., are looking well. The hay crop was very good—as much as five tons to the acre were taken from some fields. The aftermath is very fresh and green, making a good growth. Farmers are increasing and improving their live stock very much. There are some fine herds of "thorough-breds" in this county. R. S. W.

CANADA, Cornwall, Ont., Aug. 31.—The grain crop in this part of the country is very good and the weather is very favorable for harvesting. Hay is thin owing to the dry weather, and will be from three to four dollars a ton higher than last season. Potatoes will be small and few in a hill for the same reason, though they looked very promising in the Spring. I do not think the potato bug was so bad as last Spring. Mangolds and other roots that are not full-grown have suffered considerably from the drought, but the rain a few days ago helped them a good deal. W. S. T.

CANADA, Ontario, Oxford Co., Aug. 30.—Fall wheat good, yielding from 25 to 35 bushels per acre. Spring wheat will be a failure. Oats and barley good. Apples very plentiful. Grapes good but rotting badly on the vines. Potatoes a good crop, but in some places rotting badly. Beauty of Hebron, St. Patrick and Bliss's Triumph have given the very best of satisfaction where they have been tested, yielding better than the Early Rose. W. V.

CANADA, St. George, Ont. Aug. 30.—Fruit and grain come fully up to expectations. Wheat averages 25 bushels per acre; barley, 30; oats, 45 bushels. Of peas not many are grown this year on account of bugs. Corn has been planted instead. Apples are abundant. Peaches are an average crop. Pears scarce. A. C.

CONN., South Glastonbury, Hartford Co., Aug 31.—Tobacco, the leading crop here in the Valley, is about all harvested, and without exception is the *very best*, in every respect that has ever been grown here, and farmers are all happy in the anticipation of good prices. There is an abundant second crop of grass, and many are mowing, one man reporting that he had 2,200 pounds from one acre; 356 bushels of Beauty of Hebron potatoes from one acre on this farm this season, speak well for the Beauty. G. H. & J. H. H.

ILL., Ludlow, Champaign Co., Sept. 1.—Our dry weather ended about the 26th ult. Light local showers and sprinkles came first, increasing in frequency and extent till in this locality about 2½ inches of water have fallen. In some neighboring localities the rains were still heavier. The weather is warm and close, with prospect of more rain. The pastures are rapidly growing green again, the grass starting up with the freshness of early Spring. Late corn will be much benefited, as this warm weather is rapidly swelling out the ears which though short, will, if frosts do not come too soon, be sound and solid. Much early corn had dried up before the rain, and some of it is badly shrunken, while the earliest is filled out pretty well. The ground is in fine condition for plowing, and this work is being rapidly pushed. Many farmers are trying a little patch of wheat; many more would do so but for the fact that chinch bugs so common in wheat are apt, when the wheat is harvested, to move into adjoining corn-fields and injure the corn enough to take off all the profit on the wheat. It is therefore thought advisable to sow wheat only where a strip of grass or flax may lie between it and neighboring corn-fields. Peaches and grapes are ripe and abundant. The price of corn has advanced to 31 cents and of butter to 18 to 25 cents. "G."

ILL., Union Grove, Whiteside Co., Aug. 31.—In July, 1879, the lightning struck a large cottonwood tree in my garden. Near the tree was a row of grapevines, the posts eight feet apart, with a fence wire on top of the posts. The lightning left the tree and followed the wire several rods each way from the tree. The vines soon looked as if they had been frosted and the fruit wilted. In the Fall I cut the vines off near the ground, but they were dead and did not sprout up. Every post was badly shattered. The blight has made sad havoc with young fruit trees this season. The tops of very many of the most thrifty ones are dead. The pear trees in particular are thus affected. The wheat crop in this section was nearly a failure; the Winter wheat died and the Spring sown was destroyed by chinch bugs and blight. Corn, late potatoes and pastures are now suffering from lack of rain. A. M. A.

ILL., Champaign, Champaign Co., Sept. 1.—The heat here has been terrific, and is still so—at seven o'clock last night the mercury in a large open house, in the second story, standing above 90 deg.; though there had been no fire since before noon. At seven this morning it was 80 deg., though at this writing, eight a. m., there are signs of a cooler change. Prices for agricultural products are well maintained; briefly there is a short crop in the West—due to drought since the 15th of July. B. F. J.

IND., Roanoke, Huntington Co., Sept. 3.—Crops are fair to good here. Wheat sells at 90 cents; flax, $1.10. Potatoes and corn are good on uplands, but poor on bottoms. The fruit crop is large, but inferior in quality. A large acreage of wheat will be sown here this Fall. Farm lands for sale are very scarce. A. C. H.

IA., Green Mountain, Marshall Co.—It has not been a very good season for root crops in this locality, it being too dry in the fore-part of the season. Small grain crops are very good, wheat averaging about 15 bushels of uniformly good quality—that is, Spring wheat; no Winter wheat is raised here. Oats average about 40 bushels per acre and flax from eight to 15 bush. Potatoes, late varieties, are about half a crop; early varieties good. Hay, a fair crop. Fruit abundant. A. T.

KAN., Edgerton, Johnson Co., Aug. 30.—Our drought here is at an end; we are having rain almost night and day; the ground is thoroughly soaked; ponds are filled up, and all the creeks are running—no lack of stock water now; grain is being injured in the stack particularly flax, some of which is still lying as it was cut in the fields. Where such is the case it will be nearly ruined. Corn and potatoes were greatly injured by the drought, but the present rains will benefit the late corn and potatoes, while they will also fit the soil for plowing and seeding. The largest breadth of wheat will be sown in this county this Fall that was ever known. Many varieties are grown, but Fultz and Frame take the lead, the Frame being earlier has the preference. Both are hardy and yield well. The Odessa, or Grass Wheat, a new Russian variety, is a very promising late kind, but it is not extensively introduced; it is hardy, with a stiff straw which stands well up, and it will stand drought and chinch bugs, I believe, better than any other sort raised here. Our fruit crop never was so large—thousands of bushels of apples and peaches, must go to waste in this county. The best of each are worth only twenty-five cents per bushel; grapes are selling at one and one-half to two cents per pound. A. B. D.

KAN., Parsons, Labette Co., Aug. 31—I hasten to correct the statement made in my last as to the character of the corn crop of Southeastern Kansas. I was altogether too fast in stating that the corn crop was safe and unprecedentedly large. There hardly seems a sufficient reason for the change. It seemed

as if we had had moisture enough to carry the crop triumphantly through. Some ascribe the falling off to drought and others to the chinch bugs; the latter cover the corn stalks. I am inclined to think the shortage is not because we have not had rain enough during the season to make the crop, but because our rains have not entered the ground fifteen inches for two years, and thus, while we have had rains enough to make a crop ordinarily, the subsoil has been too dry to afford sustenance to the plant during a moderately dry time. The corn is, on the table lands, chaffy; on the bottom lands, pretty good. The crop will be three-fourths of a full crop. J. B.

MAINE, Brooks, Waldo Co., August 30.—Drought of great severity prevails. Water is very scarce and feed drying up. Hay was better than the average. Grain was not quite up to an average. Corn is looking excellent. Potatoes are very promising. The beetles, however, have been very troublesome. Only persistent picking or poisoning has saved the crop. Fruit will be a fair crop. Dairy interests are not extending. There will be immense crops in our new settlements and in Aroostook County. Sheep are extensively kept; flocks of 100 and upward are common. Maine offers great inducements for sheep farming, with its cheap lands and healthful climate, good water and grand grass soil. The State fair will be held at Lewiston, Sept. 21-24, with a favorable outlook. Hay is $12 to $15 per ton; beef, 4 to 5c.; lambs, $3; eggs, 15c; butter, 15 to 17c.; pork, 5 to 7c.; corn, 58 to 65c.; wheat, $1 to $1.25; beans, $2; peas, $1; cheese, 10 to 12c. J. W. L.

MICH., Montgomery, Hillsdale Co., Aug. 31.—Wheat did not come up to our expectations on account of the hot weather just before harvest. Corn will not be over two-thirds of a crop. Oats were very light. Apples are an extra-fine crop. C. H. E.

NEB., Iowa Ridge, Saunders Co., Aug. 30.—The harvest is over with us, and thrashing machines can be seen around at work. Corn is looking quite good, but a great portion of it is very late on account of dry weather. Everything has suffered from want of rain; but during the past week it has done nothing but pour. It has improved the looks of the gardens and will help the corn. We have a great curiosity in the shape of a green snake cucumber. When measured three days ago it was five feet long and 7¾ inches in diameter and still growing. It is coiled up like a snake and startles a person when he first sees it. L. E. R.

NEB., Momence, Fillmore Co., August 31.—We have had splendid harvest weather. It was somewhat too dry for three weeks, so that we feared the corn would not make a full crop; but now we are having plenty of rain every other day. Wheat turned out lighter than was expected, owing to the great number of green heads among it. Plowing is easy work now. By the way, that man who didn't succeed in killing the potato beetles with London-purple must have got some badly adulterated stuff. The use of it didn't kill our potato vines, but one application exterminated all the potato beetles. J. O.

NOVA SCOTIA, Petite Riviere, Lunenburg Co., Sept. 2.—Owing to long-continued drought the hay crop in all the western counties of this province is only about half the usual quantity. Spring wheat is pretty good—the weevil is in some. Winter wheat is not sown here. A considerable quantity of rye is sown here on burnt land; it looked well standing; but the kernels are small. Barley is the grain mostly depended on here and will be a full average crop. Of potatoes, a great quantity of good ones is grown in this county. They are yielding well this year—no rot as yet; no beetles up to this time, but I dare say they will soon find us out, as they are in other parts of the province. Of corn only a very small quantity is grown here. There is not much fruit of any kind except apples, of which there will be an average crop, but not as large as last season. A few persons are trying to raise grapes and I hear that they succeed very well. Very little is done in the way of raising tame fruit. We have plenty of wild strawberries, raspberries, blackberries, cranberries and many others—which can be had for the picking, or from two to ten cents per quart. The Army worm was here for a short time but did very little damage. It was too late in the season when it commenced work. About a week ago we had a great rain and everything looks much revived by it. L. W. D.

PA., Hosensack, Lehigh Co., Aug. 30.—We have a very dry spell at present. Late corn will not yield half a crop if we do not get rain. Wheat was a medium crop; so was corn. Oats were rather light and short in straw on account of the drought. Potatoes are not as good as last year. Hay was a good yield, and the second crop in meadows is fine. H. E. E. R.

UTAH, Glenwood, Sevier Co., Aug. 20.—Wheat harvest is in full blast, and machines are busy everywhere, even the "Armstrong Self Rake" (cradle and hand rake) is competing for the honors of the field. Some Fall wheat that appeared poor this Spring, has been thrashed out and gave about 28 bushels per acre. The Spring wheat is very well headed and will turn out well. Oats are about the same. Barley is not raised here to any extent, though I was told that brewers in Salt Lake City import most of their barley. Several years ago a large quantity of two-rowed barley was shipped from the north of this Territory to Chicago for brewing, and was said to be the best found in the United States. Corn is doing well, and the season has been, so far, very favorable, and free from frost. Potatoes are setting well. Flour came up as high as $4 per hundredweight in July, but the new crop will soon put it down to $2, or even $1.50, it is feared. Apples are abundant in the older settlements, and there are some peaches, grapes, and plums. Eggs, 12½ cts.; Spring chickens, 20cts.; butter, 20cts.; beef, on foot, four to five cts.; mutton, five to six cts. Freighters realize about double these prices at the mines, distant 150 to 200 miles. The mines produce a good amount of silver and gold; but the bulk of it is shipped out of the Territory, and I believe the potato fields bring *us* more real wealth. W. M. C.

WASH. TER., Cedar Creek, Whitman Co., Aug. 23.—The Beauty of Hebron potatoes I received from the RURAL are the finest, best and earliest tubers we have. The Cuthbert raspberries are dead. I don't think the oats you sent are as good as the oats we have, but shall try them again next year. The beets are fine—the best I have seen. J. LA D

WIS., Louisville, Dunn Co., Aug. 30.—Grain was all more or less injured by drought. The harvest is all done, and stacking nearly so, and thrashing has commenced, but the best yield does not exceed, for wheat, 14 bushels per acre; oats about 50 bushels; but some yields are as low as four or five for wheat and 10 for oats. Wheat the county through will average about 10 and oats about 35—not more. Corn has been injured 25 per cent. from what its appearance indicated a month ago. Potatoes are a short crop also, on account of drought. New grass seedings are nearly all a failure, as also will be the clover seed crop. Help is plentiful, through harvest hands work at $2. Self-binders save the demand for help, besides doing the work better. Apples are a good crop of crabs—about all we raise here. Amber Cane is but little raised—only enough for an experiment, there being no mill near here to work it up. F. M. S.

WIS., West Salem, Lacrosse Co., Sept. 1.—We had splendid weather for harvesting. Wheat, both Winter and Spring, is a light crop—thrashers say from four to ten bushels per acre. Early oats are good; late, poor. Corn is good and so are potatoes and Amber Cane. Cane mills are just commencing work. Apples, grapes and most small fruits are good. The cabbage worms are destroying the cabbage. Clover seed is blighted; farmers are cutting the clover for hay. H. A.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Poll Evil.

S. T. P., Silcott's Springs, Va., has a valuable mare affected with poll evil which has been running for six or seven months, and he asks for a remedy.

ANS.—Poll evil is due to blows or bruises caused by the horse suddenly lifting its head and striking it either against a part of the manger, a beam or the ceiling of a low-roofed stable, or the lintel of the door. Straining against the bridle or halter, rubbing the poll against the divisions of the stalls or other object, blows from an angry and brutal driver, and the irritation caused by forcing a small collar on a large horse, are all fruitful causes of the malady. The evil may exist some time before any of the ordinary symptoms become manifest. These consist of a painful swelling, hot and tender, about the nape, generally inclined to one side, marked by a sense of fluctuation under pressure of the fingers of each hand. This fluctuation is the more noticeable the nearer the seat of the disease may be to the surface. The size of the tumor, too, is an indication of the locality of the center of the ailment; the more deep-seated it is, the smaller usually is the swelling. One should not wait for the tumor to break of itself, but so soon as the matter can be distinctly felt, an opening should be made at the lowest point in the tumor, so that all the matter may run out as fast as it forms. The opening should be made large enough to allow free passage to the discharge. Poultices may be used to promote the discharge, or a paste made of sugar, soap, and powdered blood-root, equal parts, rubbed together in a mortar, spread on a cotton cloth and kept on the tumor by means of a bandage. In recent cases the establishment of the dependent opening will alone suffice to effect a cure. In cases of long standing, however, where fistulas have been formed, the passages become cartilage-like, and will not close together rapidly. In such cases a stimulus must be applied to the interior, either in the shape of a seton tape passed through from end to end and left there—and this is the safer plan, or by means of chemical injections, such as chloride of zinc—one drachm mixed with a pint of water and carefully injected into every part of the sinuses or pipes, twice or thrice a week. It is always safest and wisest to obtain the services of a good veterinarian to perform operations of this kind.

Warts in Horses.

C. O. D., West Liberty, W. Va., asks for a remedy for warts on a horse. They have been on the animal for five years—mostly on the inside of the leg.

ANS.—There are several ways of removing these unsightly excrescences. One way is by first picking off the rough outer surface, so as to make them bleed, and then rubbing in with a stiff brush some yellow ointment—to be had at the druggist's—wetted with a little water. This will cause considerable inflammation, and in a few days the wart will drop off, leaving a healthy sore which soon heals. Sometimes the whole wart does not come off on the first application, in which case a second must be made. Of course, where there are many warts, all should not be operated upon at the same time, for humanity's sake. Another way is; arm a common suture needle with a double ligature, each made of three threads of saddler's twine; pass the needle through the center of the wart close to the skin, tie each part separately with a surgeon's knot, as tightly as possible; cut the ends off close to the knot, and in a short time the whole will drop off. This for a wart with a broad base; one with a small base may generally be removed by tying a single ligature round the base. If the sore does not heal soon, moisten it occasionally with tincture of aloes and myrrh; and if it shows a tendency to ulcerate, sprinkle it with powdered charcoal and blood-root in equal parts. This is a slow and painful process, however, and perhaps the best and least painful way is by the use of the knife. Take a sharp-pointed knife and run the blade through the wart or several in succession, with an upward motion, the edge being turned away from the skin. Remove the interior of the wart and occasionally touch the part with a solution of chloride of zinc—one grain to an ounce of water. When the wart is of a cartilaginous kind, cut it off at the base, and stop the bleeding with tincture of muriate of iron, tincture of mastic, or other styptic. Warts may also be removed by the application of butter of antimony, or, stronger, by nitrate of silver or lunar caustic; or, stronger still, sulphuric acid, made into a paste with powdered sulphur, and applied by means of a flat piece of wood.

The Brooks' Telephone.

A. H. G., Auburn, N. Y., in RURAL of Aug. 21, asked about our opinion of the Brooks' Telephoue, which we gave in accordance with our personal experience with one of them. Professor Brooks writes to us in this connection.

"I am very much surprised at the slighting way in which you refer to my telephone in "RURAL" of August 21, and it certainly does me a great injustice. The telephones you based your remarks upon were some of the first *small* instruments I made, and are not to be compared with the much larger instruments greatly improved in every way, that I have advertised and sold for the past nine months, and which are giving the highest satisfaction. The wire, too, that I now make and recommend is much larger and of copper, and requires very little attention when once properly put up. Not one word of complaint has reached me from those using my instruments as now made and sold.

[We were not aware that the telephone sent to us was not the same as that advertised, and, therefore, hasten to make the correction.—Eds.]

Miscellaneous.

G. E. S., West Townshend, Vt., asks which is the best, cheapest and most easily understood work on diseases of cattle.

ANS.—Among the many works published on this subject we cannot undertake to decide which answers best to the above conditions. It is very doubtful whether any work is the best in all these requirements. Law's Farmers' Veterinary Adviser, price $3, is perhaps the best book for a farmer on diseases of stock generally. Clatter's Cattle Doctor, by Armitage, is as good a work on diseases of cattle as any we know of—price $6. The first can be got directly from Dr. Law, Cornell University, Ithaca, N. Y.; the second from the publishers, Scribner's Sons & Co., N. Y. City. We have answered similar questions frequently within the year.

M. A. P., Sterling Station, N. Y., has a meadow overgrown with weeds having tall stalks crowned by a tuft of yellow flowers, and asks whether they are Golden Rods, and how to kill them—will shallow plowing this Fall do so?

ANS.—It may be the common mullein, Verbascum Thapsus. This seeds bountifully and should be pulled up while young. Plowing will kill the present plants. It may be one of the Golden Rods. The same may be said of this. Our friend should send flowers.

Westchester, Westchester Co., N. Y., says that he saw frost there on Aug. 16, 17 and 28, and asks whether we have heard of any other frosts in that neighborhood this season.

ANS.—Not in that exact vicinity; but in "Agricultural News" of Aug 28, under heading of Aug. 23, the RURAL says:—"Just a week ago, on August 16, a heavy white frost visited most parts of Delaware and Dutchess counties N. Y. and the Catskill Mountains;" we might also, it seems, have added Westchester Co.

E. S. S., Eagle Harbor, N. Y., asks, 1, is it necessary to remove the soil from the inside of a cold grapery in renovating the ground, or can it be kept in good condition, and if so, how; 2, he got a number of Cuthbert Raspberries, well packed and in good condition, yet out of 150 planted only 30 grew, and he asks the probable cause of the failure.

ANS.—1, Yes, by forking in well rotted manure. 2. If the Cuthberts were received in good order we can offer no explanation of the failure. Possibly they were planted too late.

E. W. K., Glen's Falls, N. Y., sends three apples for name, and sketches of them lest the fruit should arrive in a condition too decayed for identification.

ANS.—The apples were received in good order, so far as packing was concerned, but they were so decayed that we could not identify them; neither could we do so by the cuts, in view of the immense number of varieties, between many of which the differences are too slight to be shown by a rough outline.

D. C. C., Manton, Mich., says a man has been traveling through that section selling apple trees, who claims that the trees will bear the second year after having been set out, and every year thereafter. He also says that for 50 cents he will sell a six-year-old root with a three-year-old budded top, and our inquirer asks whether the man is telling the precise truth.

ANS.—No, by no means. The fellow's statements are absurd.

V. V., Oxford, Ont., Canada, asks, 1, the best remedy for mildew on grape vines under glass; 2, the best varieties of peaches for home use; 3, the latest date at which the weight of mangels from the RURAL'S Free Seed Distribution must be sent in to compete for premium.

ANS.—1. Sulphur. 2 Early York, George the Fourth, Grosse Mignonne, Old Mixon Free, Red Cheek Melocoton, Royal George. 3. Any time before severe frosts.

A. J. B., Clarksfield, Ohio, has 122 mangels from his paper of seed, and as some of them are very fine, he wishes to compete for the premium and asks whether it is necessary to weigh them immediately. They are growing finely now.

ANS.—Certainly not; wait until they are ready to be harvested.

J. D., Lowell, Mich., writes, under date of August 12, that he has sent on a basket of seedling peaches for the RURAL office, and asks our opinion of them.

ANS.—Those peaches have not been received here.

D. B., Grundy Center, Ia., asks who make corn huskers.

ANS.—C. H. Mallison, Phillips' Spiral Husker, a good power husker, Hudson, N. Y.; Jacob Van Zandt, Schenectady, N. Y., also makes a good husker.

H. R. P., North East, Pa., asks what is the best time to shorten the branches of pear, peach, apple trees, etc., so that they will put forth fruit spurs for another crop.

ANS.—Early Spring is our choice.

E. M. C., New Lisbon, O., asks whether it would be advisable to use quick lime on land this Fall after the wheat sown on it is up.

ANS.—No.

J. W. B., Union City, Pa., asks when the mangels sent out by the RURAL must be pulled to compete for premium.

ANS.—Not until frost.

J. J., Fontana, Kansas, asks whether the Eucalyptus globulus will stand Kansas winters.

ANS.—We do not think so.

Clergymen, Lawyers, Editors, Bankers and Ladies need Hop Bitters daily, for nerve force.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY SEPT. 18, 1880.

The Rural New-Yorker has never up to this time exhibited any of the products of its farm at the fairs, for the reason that such exhibitions require an amount of time and labor that we could not spare. We shall make the present season an exception, however, at the pressing request of several friends. The Queen's County Agricultural Society will hold its annual fair at its grounds at Mineola on the 28th, 29th, and 30th inst. As these grounds are but a few miles distant from the Rural's Farm, we have decided to make an exhibit of our Branching Sorghum, Blount's Corn, seedling potatoes and of several different kinds of wheats. This fair is always ably managed and attended by thousands of people. We hope that any of our Western, Northern or Southern readers who may be visiting New York at that time, will be pleased to spend a few hours at the Mineola Fair. Persons may leave New York and return by railroad at almost any time they may desire.

FULTZ WHEAT. THIN SEEDING.

We may now report the results of our experiments with Fultz wheat. One plot, 33x33 feet, was sown in drills 12 inches apart—seeds dropped two inches apart. Bone superphosphate was sown at the rate of 500 pounds to the acre. It was cultivated once in November. The yield was 38 pounds, or at the rate of 25 1-3 bushels to the acre. A second plot of the same size was sown in drills six inches apart, and no fertilizer of any kind was used. The yield was 37¾ pounds, or at the rate of 25⅛ bushels per acre, The unfertilized plot showed that it was inferior to the other, as is evident from the fact that, being sown only half the distance apart, the yield was nearly the same. Had the plot been fertilized, it is fair to suppose that the yield would have been greater. Thus our tests for three years in succession have shown that the cultivation of wheat and thin seeding do not pay.

The straw of Fultz is not so heavy as that of Clawson, but it stands up quite as well.

GRAPES AT THE STANDS.

The fruit stands of New York City may often prove profitable instructors to fruit growers. During the past ten days we have noticed among grapes that some of Rogers's Seedlings have been offered in larger quantities than ever before. They are extremely showy if not of the first quality and have sold readily at from 10 cents per pound for black—such as Wilder—to 20 cents for white—such as Goethe. Rebecca (white) is now selling in immense quantities at form 15 to 25 cents the pound. This, owing to its firm skin and compact bunches, is at present our best market white grape, and it is to be regretted that it thrives over so restricted a part of the country. Delaware, the cream of grapes, brings at the stands 10 cents, while Concords—and they were never larger or of better quality—bring five. We always associate the Delaware grape and the Seckel pear. Each is the prince of its kind.

Grapes, grapes everywhere; and it is a pleasure to see that many of the poorer classes of people who in past years have rarely indulged in these luxuries, eat them freely now. Thus with increased supply come lower prices and an increased demand.

A MYSTERIOUS BEETLE VISITATION.

What the Rocky Mountains are at intervals to our Western States as breeding places of countless locust swarms, the Black Sea is yearly to the Southern provinces of Russia as the mysterious source of innumerable myriads of harvest beetles. It is now 15 years since the waves of that inland sea washed on the Russian shores thick swathes of the eggs of the pest, and every year since then the visitation has been repeated. Whence they come nobody seems to know. The eggs are first seen floating on the waves and as soon as they get stranded the larvæ come forth, and soon swarm after swarm of beetles pass over the Crimean valleys into the interior, ravaging the rich grain fields and lessening or annihilating the scanty earnings of the peasants. Machines of all sorts have been used against them in vain, which was to be expected in view of the calculation that a single ordinary field near Kharkoff contained last Spring 350,000,000 insects.

A late Kharkoff paper contains a long continuation of a list, published every week, of the amount of beetles collected by the peasants for doing which the local authorities grant small subsidies. From this we learn that two tons were gathered during the previous week in the commune of Veselandskij; five tons at Vasilievsky; seven tons at the German colonies of Eigenfeld; ten tons at Belozersk, while the inhabitants of Prishilsk were particularly active, or the beetles were there especially numerous, inasmuch as fifteen tons were harvested. Indeed this beetle harvest is said to be nearly the only harvest gathered in that section this year. There is a report that a fly that preys upon the pests has lately made its appearance there, and on the labors of this friend the peasants' hopes are now centered, in the absence of birds from the Russian steppes.

A PROSPECTIVE IMPROVEMENT IN PLANTING COTTON SEED.

Gen Le Duc thinks a valuable discovery has been made by Prof, T. Taylor the microscopist of the Department of Agriculture in relation to the planting of cotton. While investigating the situation of the oil cells in Indian corn, he was led to experiment on the resistance offered by seeds to agents generally considered destructive of organic life, cotton seed being used in the experiment. To remove the list from the seed he employed concentrated sulphuric acid, which removed it entirely without apparently affecting the outer brown shell. Mr. Saunders, the horticulturist of the Department, planted some of the seed thus treated and afterwards washed, and, lo! it sent up plantlets five days earlier than seed in the natural state. To learn whether this was due to the soaking it had received, some of it was kept dry for some months, and then planted along with seed of the same crop unprepared; and the result was the same. To prepare the seed, it is placed in an earthenware or glass vessel and ordinary sulphuric acid is poured over it until it is entirely covered. It is then stirred until all the lint is removed from the seed. The acid is next poured off to be used for the same purpose again, and the seed is washed until all traces of acidity disappear, when it is dried.

The Department of Agriculture is about to prepare a large quantity of cotton seed in this way, and distribute it among planters for experiment next season. Should experience in the field confirm the results of these experiments in the garden, the advantages to the South will be very considerable. Besides the benefit of five or six days' advance in the growth and maturity of cotton, by which early frosts can often be forestalled, seed thus cleaned can be sown with any planter used for corn or other clean seed, securing greater regularity in growth and facilitating cultivation. Hitherto cotton seed has had to be sown by hand, as it could not be used in any planter owing to the adherent list preventing its uniform deposition.

THIN-SEEDING OF WHEAT.

As readers of the Rural New-Yorker, know we have for three years past experimented to ascertain the amount of seed wheat that should be sown to produce the greatest yield. Our *cultivation* of wheat has twice proven a comparative failure, so that we are obliged to condemn this method which is now being advocated by a number of agricultural journals. Thin seeding without cultivation has also proven unprofitable with us, and we shall not the present season drill in less than a bushel and three quarters per acre. Touching this question, Mr. C. E. Thorne, the farm manager of the Ohio State University, writes to the Husbandman as follows:

"The heresy of thin seeding first made its appearance in England, if I mistake not, many years ago; and it is upon the rich, garden soils of that country, where crops of 50 and 60 bushels per acre are as common as those of 30 and 40 bushels here, that we should look for the success of such seeding, if it has any merit. Hear, then, what J. B. Lawes says in the "Fair Number" of the Rural New-Yorker, for 1879, (page 576.) 'No one here cultivates wheat, nor has thin seeding ever made much way. At the present moment the great bulk of the wheat grown in this country is drilled in rows about five inches apart, and the seed used is about two bushels per acre. It stands to reason that if one plant of wheat has possession of one or two square feet of soil, its power of growth must be increased; but except upon garden soil, or upon farms in exceedingly high condition of cultivation, I feel sure that thin seeding will never be successful.'

In further confirmation of my faith I would refer to the field experiments of Prof. I. P. Roberts of Cornell University, who obtained increasing crops until three bushels of seed were reached. It will be noticed that our crops diminish after passing two bushels. I suspect the explanation of this to be that Prof. Roberts's wheat was sown on very thin land, while ours was sown on a rich bottom, capable of producing 25 to 40 bushels of wheat or 50 to 80 bushels of corn for an indefinite period, and without manure."

A full report of Prof. Roberts's experiments are given in this issue of the Rural New-Yorker.

RELIEF FOR BRITISH AGRICULTURE.

The Hares and Rabbits bill, after a bitter opposition of outspoken antagonism and insidious amendment in the House of Commons, has at length become a law in England, not a little to the relief of British agriculture. It was feared that after its passage through the lower House, the House of Lords would either extend to it the same harsh treatment given some weeks ago to the Compensation for Disturbances bill, or else destroy its vital principles by cunning amendments. The Peers, however, unwilling to weaken their influence among the agricultural classes, and conscious that the English farmer is a more formidable adversary than the Irish peasant, and that their former action had aroused against them a public sentiment it might be perilous to inflame by a fresh display of aristocratic disregard of the general weal, suffered the bill to pass without opposition in their own House, after having used their best efforts to defeat it in the House of Commons by means of the votes of their numerous sons, relatives, connections, dependents, toadies and friends who hold seats in that body.

The declared object of the bill is the better protection of occupiers of land against damage to their crops by ground game—a term applied to hares and rabbits. The general definition of "game" also includes pheasants, partridges, grouse, heathcocks or moorcocks, blackcocks, woodcocks, snipes, quails, landrails or corn-crakes and bustards, against whose ravages the bill still leaves the farmer without protection. In other respects, too, the relief afforded by it is limited, as it only bestows on the tenant the inalienable right to kill ground game on his own farm by himself or his agents concurrently with his landlord, but does not compensate him for the incursions of the pests from neighboring preserves, nor does it check their increase on adjacent land. How rapid this increase may be can be inferred from the calculation that in four years a single pair of rabbits may, if unmolested, become the progenitors of 1,250,000. Knowing well the dominant influence of the landlords, the framers of the bill wisely incorporated in it the provision that every agreement, condition, or arrangement purporting to convey away the rights conferred by it, should be void. It would have been a mockery to have given the tenant any option in this matter, for many of the landlords would then certainly have given him none.

On reading over even sparse extracts from the mass of evidence given, seven years ago, before the Committee of the House of Commons on whose report the bill is based, with regard to the oppressive character of the British game laws, it is not easy to understand how such persistent grumblers as the English farmers could have tolerated the evil so long, unless on the supposition that the discontent that should have been utilized in action was frittered away in futile words and heartburnings. It was then shown that in some instances ground game destroyed as much as half the crops, and were in nearly all cases a grievous loss and nuisance; that the preservation of game kept large tracts, aggregating millions of acres, out of cultivation; that could the pests be kept within reasonable bounds, 40,000 more sheep could be maintained in the country; that the 10,000 tons of ground game annually brought to market represented a clear loss of $20,000,000; that for the last few years 10,000 convictions annually took place under the cruel provisions of the game laws.

The severity of these laws may be inferred from that which enacts that any person convicted of killing a rabbit, a woodcock, or any other sort of game, even on uninclosed land or the public highway, from the end of the first hour after sunset to the beginning of the first hour before sunrise, shall be punishable, for the first offence, by three months' imprisonment with hard labor, at the expiration of which he must find sureties for his not so offending again. For a second offence the penalty is six months' imprisonment with hard labor, and an additional twelve months in default of sureties; while for a third offence of killing a hare or rabbit the monstrous wretch is punishable by two years' imprisonment or seven years' penal servitude. In nearly all cases the committing magistrate is the next landlord who happens to be a justice of the peace; perhaps the very man on or near whose territory the heinous crime was committed, and who is pretty sure to be righteously wrathful at the criminal's atrocious rascality. Moreover, any constable has power to stop and search, by day or night, in any highway, street or public place, any person whom he may suspect of coming from any land where he may have been in search of game; and also to stop and search any vehicle in which he may suspect that game may be carried.

These laws are still in full force, except with regard to hares and rabbits; but the day cannot be far distant when the last vestige of such feudal legislation shall be swept from the statute books, whose pages such mediæval enactments besmirch in this nineteenth century.

BREVITIES.

We learn that at this season of the year the old stock of peas is sold to coffee houses to mix with their coffee.

We have received from West Virginia a crate of beautiful plums, and should be glad to know to whom we are indebted for the same.

Friend farmers—prepare your land for wheat better than you have ever prepared it before. Harrow, harrow, harrow. If the soil is sandy, roll after sowing or drilling in. If at all inclined to be clayey, roll before sowing. See if the results of this careful preparation do not more than repay its cost.

In the few thousands first printed of our Fair Number for the current year, on page 583, the subheads, "Milk" and "Cheese," in the article "Small Cheeses for Home Use," were inadvertently made to interchange places, after the "proof" had been read. The slip was corrected as soon as detected, and those of our readers who may have received the copies first taken from the press, can from the context easily make the necessary transfer of subheads.

The National Fair Association gives $8,000 not $11,300, in purses for trotters at the annual fair to be held in Washington from October 5 to 16. St. Julien the reigning "King of the Turf," will try to beat his best record of 2 11¼, for a purse of $2,500, on October 8. Our readers can have no doubt of the strength of our objections to trotting at agricultural fairs; but if the evil must be endured, it is certainly more satisfactory that a "King" rather than an ordinary brute should be the culprit.

Strange that in a country so densely populated as China vast tracts of good land should remain uncultivated; yet the Governor of the Province of Che-Kiang lately proclaimed that, though seventeen years have elapsed since the Taiping civil war ravaged the country, large areas have since remained untilled. In three named departments 1,600,000 acres are idle, and in three others 6,000,000 acres. Some of the land is poor, but at least 5,500,000 uncultivated acres are rich and fertile. Surely here is a big opening at home for every Mongolian in this country.

Mr. Charles Downing writes from Newburgh, N. Y., "Plums have been very abundant here and fine." That is the report from many localities where, owing to the curculio, the crop is generally light or a failure. Mr. Downing also writes: "Unless it rains soon, vegetation will be dried up. All kinds of fruit is ripening very early—even apples will soon have to be gathered if the drought continues, or else they will shrivel on the trees, as there is apparently no moisture in the ground to the depth of four feet. The late peaches will be small and poor."

During the eight first months of this year the aggregate rainfall has been several inches less in this section than the average for the corresponding months of the past 41 years. According to Prof. Daniel Draper, of the meteorological service in Central Park, this city, the rainfall gradually increased from 1835, when his record began, until 1869, since which time it has shown a tendency to decrease. He has little faith in the theory that forest denudation affects the amount of rainfall; but he has a theory of his own to the effect that there are cycles in rainfall as there are in sun-spots and other astronomical and terrestrial phenomena, and a cycle of rainfall he estimates at 60 years, and according to his calculations we may expect a gradually decreasing rainfall for several years to come.

Literary Miscellany.

WHITE CLOVER.

The distant hills the long day through
Have fainted in a haze of blue;
The sun has been a burning fire,
The day has been a warm desire,
But all desire is over;
The lights are fading from the west,
The night has brought a dreamy rest,
And deep in yonder wood is heard
The sudden singing of a bird,
While here an evening wind has stirred
A slope set thick with clover.

The fields have lost their lingering light,
The path is dusky through the night—
The clover is too sweet to lose
Her fragrance with the gathering dews,
The skies are warm above her;
The cricket pipes his song again,
The cows are waiting in the lane,
The shadows fall adown the hill,
And silent is the poor whip-poor-will,
But through the summer twilight still
You smell the milk-white clover.

The glory of the day has ceased,
The moon has risen in the east,
The distant hills, the meadow near
Are bathed in moonlight soft and clear,
That veils the landscape over,
And born of rare and strange perfume,
Pure as the clover's odorous bloom,
Dear hopes that are but half confessed,
Dim thoughts and longings fill the breast,
Till lost again in deeper rest
Among the blossomed clover.

INMATES OF LESTER HALL.

CHAPTER I.

(Continued from page 597.)

"RUBY went charmingly," she said in a moment, perching herself on the table and glancing at her sister with a very tender light in the starry hazel eyes. "I think, if Rex will let me, I shall be able to hunt this season. By-the-bye, I have a letter for Rex. Where is he?"

"A letter? What an unheard-of event!" said Mattie with a little laugh. "It is not a bill, I hope, Cecil?"

"Oh! no; certainly not a bill," said Cecil, decidedly. "Superfine paper, and a stately crest. Mattie, I believe it is from Uncle Henry; judging from the post-mark, see," and she tossed the letter into her sister's lap, "there it is."

Miss Lester examined it with a faint flush of expectation coloring her fair face.

"Yes, it is from Uncle Henry," she said. "I wonder what it can be about?"

"He does not often favor us," said Cecil, rather disdainfully. "He is too rich and too grand, I suppose, now that he is ever so many times millionaire. Oh, dear! how nice it must be to be very rich. If one could only be so honestly!"

"I never heard anything against Uncle Henry," said Mattie, quickly. "Some people do make fortunes in these days without being dishonorable. Uncle Henry is very much respected in the city, I know."

"How do you know?" asked Cecil, with a little laugh.

"I have seen how he is spoken of in the papers, and I have heard of his very great goodness to the poor," said Mattie, as she contemplated the letter with its legible, business-like address.

"I don't think he has been very good to us," said Cecil, with a pout.

"We did not want anything from him," said Mattie, hurriedly. "Mamma used to tell of his goodness and care of her when they were children. I am sure he would love you, Cis, you are so much like her!"

"I wonder what he is writing to Rex about?" mused Cecil, as she came down from her perch on the table and stood looking down at her sister, who was leaning back in her chair with a moved expression on the fair face.

"Yes, I wonder too," said Mattie. "I hope, oh! how I hope, Cecil, that it is to offer him some employment.

"Mattie!" exclaimed Cecil, her hazel eyes opening wide with horror at the suggestion. "Some employment for Rex!"

"Yes. Why not?" said Mattie more earnestly than she generally spoke, with her color deepening, and her eyes brightening with excitement. "Is there anything disgraceful in work, Cecil? I would give anything in the world to save Rex from the purposeless, idle life he leads now."

"Why, Mattie," said her sister, laughing, "I never saw you so excited. Have you been reading Dr. Watts lately, that you wax eloquent on 'idle hands' and 'mischief?' But, Mattie," and the girl's bright face shadowed over and grew momentarily grave, "I never thought you would like Rex to be a clerk."

Mattie winced.

"I see no harm in any employment that is honest," she said, sturdily. "Why should not Rex make a fortune as Uncle Henry has done. He began with nothing, and now he is enormously rich."

"I detest an upstart," said Cecil.

"I believe if we could know Uncle Henry we should love him even as our mother did," said Mattie.

"Perhaps so," said Cecil, dubiously.

"Remember our dear mother, Cecil," said Mattie, gravely. "Your remarks reflect upon her, you know."

"I beg your pardon, Mattie," Cecil said, penitently. "Forgive me, and I will not offend again."

"I know you spoke thoughtlessly. You are too young yet to know how bad it is for a young man not to have any occupation. Oh, Cecil, if I could get Rex something to take him away from these surroundings."

"Well, perhaps Uncle Henry's letter may give him an opportunity," said Cecil, lifting first one of her sister's hands and then the other to her lips with almost loverlike devotion. "Rex is so——"

"Who is taking my name in vain?" said a gay voice at this juncture, and looking up quickly, Cecil saw her brother standing at the entrance of the room, looking down with a smile at the pretty group his entrance disturbed, for Cecil sprang up to meet him with a gay speech of welcome.

CHAPTER II.

THE LETTER.

Reginald Lester was a tall, slender young man, with delicate, regular features, like his sister Mattie's and hazel eyes like Cecil's, but softer and lacking their brilliance. He was well-built, and moved gracefully; had much of Mattie's manner and some of the languid grace and nonchalance which had characterized his father; but the proud resolve of his younger sister, and the sweet, steadfast gravity of the elder, were equally wanted in his face. His expression was discontented, although his face was naturally sunshiny and serene and his voice gay; but the disadvantages of his surroundings had had far more effect on Rex Lester than on his sisters. He had imbibed from his father's an exaggerated notion of his own importance. He chafed greatly against the anomalies of his social position. Of high family and without fortune, of good position without means to support it adequately, and with tastes and aspirations which he could not gratify, it was no wonder that very often Rex Lester was moody and dissatisfied and tempted to forget his annoyances in any means of excitement obtainable in the little village of Lester.

It was not such bad fun after all presiding over the meetings held at the "Huntsman's Rest"—the only decent inn in the whole village; for the fox-hunting young farmers who met there had a great respect for the family at the Hall and for Rex himself, because—although highborn gentleman as he was, he was poorer than any there—he sat his horse better than any of them, and was always in at the death. Rex enjoyed himself there, although Mattie, waiting up for him into the small hours of the night, often prayed him with tears to give up the "Huntsman's Rest" and the companions who were beneath him.

Then, too, it was not unpleasant during the hot lazy, languid summer evenings, to saunter down by the millstream and have a chat with pretty rosy-cheeked Annie Hyde, the miller's daughter, who blushed a deeper rose when he appeared, and who was so pleased and flattered at his laughing compliments and gay speeches. There was no real harm in Rex Lester, but he was thoughtless, careless, indifferent, and discontented; he was young too, idle, and fond of pleasure, and such amusement as was in his reach he would not lose.

"Who is taking my name in vain?" said Rex, lounging in, and throwing himself down in the most luxurious chair. "What has little Dame Burden to say about me?"

"Little Dame Burden" was one of the many pet names which Cecil had given to her sister, to whom both were devotedly attached, and one which the young housekeeper liked better than any other.

"It was not little Dame Burden who mentioned your name. It was I," said Cecil, laughing. "Here is a letter for you, which I got from old Job, whom I met on my way home, and who was delighted to be saved a trail up the hill."

"A letter for me!" said Reginald. "Hand it over, Miss Cis, and let us see what it is about!"

"We think it is from Uncle Henry," said Mattie. "And we are all impatience to hear its contents. Open it, please, Rex."

"Little Dame Burden, impatient and curious, miracles are not over then?" said Rex with a laugh, as he broke the elaborate seal which closed the envelope, drew out the letter, and began to read.

It was a tolerably lengthy epistle, covering the four sides of a sheet, and written in the legible, business-like caligraphy in which it had been addressed; rather more cramped, perhaps, but still perfectly clear and distinct. Reginald Lester read it through rapidly, then he turned over the sheet and perused it again, this time more slowly, and with a darkening brow and flushing cheek.

His sisters watched him eagerly; then, as he flung the letter on the table with a muttered exclamation of "Confound his impudence!" Cecil burst into a fit of laughing which rang gayly through the hall.

"Good gracious! What has offended your mightiness?" she said.

"Hush, Cecil," said her sister, gently. "What is it, Rex? May I read the letter?"

"Of course you may! I never heard such insolence!" said Rex, haughtily. "Wants me to go into his office!"

"Who does?" laughed Cecil. "Uncle Henry? Does he really? I wish he would take me!"

"You are only a child, you know nothing about it," said Rex, contemptuously.

"Well!" said Rex, emphatically, as Mattie concluded her perusal and laid the letter thoughtfully on the table. "Don't you think Mr. Vicar's proposal a most insolent one, Mattie?"

"Insolent!" said Mattie, warmly, the color rushing into her fair face. "I see nothing but what is extremely kind and generous in Uncle Henry's letter."

"Kind and generous!" repeated Rex. "A clerkship in his counting-house!"

"But, dear Rex," said Mattie, gently still, and very earnestly, "it is not a clerkship he offers you—although even if it were it would be both a kind and generous offer—but he says that if you will go to him and learn your business, you will be to him as a son. Think, dear, what such an offer means—wealth, power and influence! Is it not better than idling away your life here? Oh, Rex, do consider seriously before you reject such a proposal! I cannot tell you how happy it will make me if you accept, because I know how much happier you will feel. Uncle Henry is so respected and looked up to. It is not as if his wealth had been made in a questionable manner; you know it is not so; you know that he is most scrupulously honest and honorable."

"Doubtless!" said Rex; "but, my dear Mattie, no Lester was ever perched on a counting-house stool yet."

"Oh, Rex!" said Mattie, reproachfully, while Cecil's laugh rang out again clear as silver.

"Rex," how absurd you are!" she said.

"Am I? perhaps so; but I am only keeping to the rules of my order," he said, rather grandiloquently; and Cecil's sweet, mocking laugh rang out again.

"'My order!'" she repeated. "What order is that?"

"Hush, Cecil, dear!" said Mattie, with an entreating glance. "Rex is, I hope, a gentleman—not from any accident of birth, but because he is true, honest, and faithful! Uncle Henry is a gentleman, too,—a noble, upright gentleman—for the same, the only true reasons."

"But Mattie, do you really mean that you wish me to accept this offer?" said Rex, incredulously.

"I do, indeed!" said Mattie, bravely. "If I had dared I would have asked Uncle Henry to make you just such an offer."

"Good little Dame Burden!" said Cecil, as her sister disappeared behind the oaken screen, "How kind she is! Rex, you must do this, if only to please her."

"But, Cis, and Reginald put his arm round his young sister, and drew her to him," would you like to see your brother a clerk?"

"Nonsense, Rex, you would not be a clerk," said Cecil. Uncle Henry would only give you the position his son would occupy if he had one. He was so fond of mamma, you know, and he would be sure to like you so much. Besides," she went on, meditatively, "it would be so unutterably jolly! Mattie is not here to be shocked at my adjective—to be able to go to the theatres, and see all the sights! Oh, do take Uncle Henry's offer, Rex, darling, and go. You will soon get rich, and then you can send for Mattie and me!"

"You selfish girl!" he said, laughing. "Is that why you want me to accept? Well, it sounds rather tempting, when one comes to think of it! I wonder what sort of a fellow Uncle Henry is?"

"I am sure he must be very nice!" said Cecil, eagerly. "He is so much thought of by every one. I know you are going to say 'yes,' Rex; and in a few years I shall be talking of my brother, Reginald Lester, the Merchant prince!"

"'How pleasant it is to have money!'" said Reginald, laughing, as he repeated the quotation after her, "We have not much of its pleasantness, have we? But we will, Cecil, if Uncle Henry gives me a chance. After all, we are his nearest relatives, and he has a right to do something for us! Shall I write to him at once and accept?"

"Do, there's a dear brother," said Cecil, coaxingly. "Dame Burden will be so delighted, and Uncle will be pleased to think that you answered him by return of post. See here, Rex, if you like to write at once I will ride over to the village and post the letter before eight."

"You are taking my breath away, Cecil, you are so energetic," said Reginald, smiling, as she brought him pens and ink and paper, and pushed a chair up to the table.

"Energetic," said Cecil, laughing, "of course I am energetic. There, sit down and write, and mind that you are civil.

Reginald threw himself into a chair, tossed about the paper and pens for a minute or two, muttered something about it being a great bore, but finally made an attempt, tore it up, then wrote off another note, which, when it was finished, he handed to his sister for inspection.

Cecil read it with an air of extraordinary gravity, handed it back to her brother to be sealed and directed, then replaced the little riding-cap which she had removed on her entrance, and took up her whip.

"Mattie is safely installed in the kitchen," she said, gaily; "I shall be back in time for tea, and our sister will be so delighted to hear that you have done so!"

"All right. Here you are, Cis; and look here, my child, ride Ruby quietly, and don't jump anything," said her brother. "I cannot have you talked of as a little wild hoyden."

Cecil laughed.

"Cannot you, indeed? Since when? Since you have had a chance of being a merchant prince?" she said, saucily.

"You shall have a finer horse than Ruby, when I am a rich man, Cecil. Meanwhile make haste, or Mattie will have finished the muffins; and if you are not ready when they are, she will be dreadfully disappointed."

Off flew Cecil, leaving her brother to ruminate over the change in his prospects, and to conjure up all kinds of dreams of wealth and pleasure from his connection with his rich uncle. Cecil ran lightly round to the back premises, saddled Ruby herself, sprang lightly into the saddle, and cantered away down the drive on to the high road. It was a straight line to the village by the road, and generally Cecil preferred finding her way to the village by fields and lanes. On this day, however, she went straight and swift, keeping Ruby at a quick trot, in order to reach the post-office before the departure of the evening mail.

"I'm not too late, am I, Mrs. Pritchard?" she said, greeting the old postmistress with a smile.

"No, Miss Cecil, quite ten minutes to spare, I hope you're quite well, ma'am and Miss Lester, and the squire also."

"All quite well, thank you, Mrs. Pritchard," said Cecil, with a smiling nod. "No, thank you, I won't get down, as I must be back at the Hall in time for tea. Good afternoon."

"Good afternoon, Miss Cecil," said the postmistress, with a curtsey; and having posted her letter, Cecil turned Ruby's head homewards and went her way, feeling that she had put Reginald's fate into her uncle's hands, and that she and Mattie had given him up for good and aye.

Cecil's heart sank a little as she pondered over the change. They had been so happy together at Lester Hall, and Rex had been such a dear, good brother to her, and they had suited each other so capitally—how could she do without him? True, Mattie had been anxious sometimes; she had thought that Reginald was too idle and purposeless; that his visits to the Mill had been too frequent, and she had wished openly that he did not go so often to the "Huntsman's Rest;" but it had been so dull at Lester for Rex, it was only natural that he should amuse himself a little. Cecil was too young to guess at the danger of such amusements as flirtations with pretty Annie Hyde, and evenings spent at the "Huntsman's Rest." She supposed it was all right, as her faith in her brother was perfect. Rex was in her eyes all that was true and noble.

"How she would miss him," she thought, mournfully, as she turned into the drive, "and how much Uncle Henry would love him when he knew how good and nice he was!"

"You have been out riding again, Cecil," said Mattie, coming out to the great stone steps as she rode up.

"Yes," said Cecil, soberly.

"Where have you been, dear?" said her sister glancing at the grave little face in surprise.

"To the post-office."

"To the post! What for?"

"To post a letter from Rex to Uncle Henry," said Cecil, slowly as she dismounted, and stood for a moment with the bridle over her arm.

"A refusal?" said Mattie, eagerly.

"No—an acceptance."

CHAPTER III.

DEPARTURE.

Mr. Henry Daton, the great city magnate, was evidently a man of prompt and decisive action. The day following that on which he had received Rex Lester's letter came another letter to Lester Hall, fixing the day for his nephew's arrival in the city, and enclosing a check for fifty pounds for traveling expenses.

This last circumstance told considerably in his favor, for Rex had passed the intervening twenty-four hours in a state of uncertainty and depression, not knowing whether he was most vexed or pleased at the decision he had made. The idea of constant occupation was anything but pleasing to Rex, especially occupation which would keep him indoors all day; and he had not really the faintest conception of a business life, and could only picture it to himself as long hours passed perched up on a stool before a desk with interminable rows of figures in a huge column which he had to add up. But Mr. Daton's cordial letter and enclosure seemed to place things in another light.

"Uncle Henry seems to be very liberal," Mattie said. "Rex, I do so hope you will get on well together, and that if he should prove at all crotchety, you will give in to his wishes. You know how lonely he is, and how much trouble he has seen in the death of his wife and only son. You will try and make it up to him as far as you can, will you not?"

"Of course—of course," said Rex, a trifle indifferently.

"You need not worry yourself, Mattie. I have no doubt that we shall get on perfectly."

"I hope so," Mattie answered, cheerfully; and although she went about her domestic duties as carefully as of old, her heart was a little heavy at the thought of the separation from her brother, although she rejoiced that a field of active employment was open to him.

The days fled swiftly by in the excitement of Reginald Lester's preparations for departure. Not that there was really very much to prepare, for of course the city tailors would be better able to supply him with what was necessary in the way of clothes, and Uncle Henry had hinted as much in his second letter.

But Rex had a good many farewells to make, and his sisters clung to him with increased affection. He felt the parting from his sisters and his home more than he had thought to do.

"It is strange that Uncle Henry should not have said anything about us," said Cecil to her sister. "I mean about going to see Rex."

"We must wait to see how Rex gets on," said Mattie. "I dare say he will give him a week's holiday sometimes to come to see us, Cecil. I do hope all will go right!"

"Of course it will go right!" said Cecil, carelessly. "What makes you anxious about Rex now, when you wished so much that he should go?"

"I don't know, but sometimes I feel as if something terrible will come of this!" said Mattie, rather despondently.

"Nonsense, Mattie! you are overworking yourself, and feel nervous!" said Cecil, cheerily. "Put on your habit, and have a canter on Ruby; it will do you good."

Mattie laughed as she turned away. Cecil's universal panacea was a canter on Ruby; but before the laugh had died away the anxious, sorrowful expression came back to her face. Rex was so impressible and easily led, she could not help feeling anxious about him; but if she could have had a glimmer of the future—she would have bitten out her tongue rather than have added one word to induce him to accept Uncle Henry's offer; and she would with more satisfaction have followed him to his grave than have helped him with his preparations for his voyage.

The days slipped steadily and swiftly on until the day fixed for his departure came. It was well known in the village that the young squire was going away to be with his uncle, of whose wealth and magnificence the good people of Lester spoke with bated breath; and he would be the heir, in all probability, people said, and Lester Hall would once more resume its old splendor. They were sorry to lose the young squire, who was very popular with them; he had none of the pride of his an-

cestors, but then he was differently placed; perhaps, had he been as rich as they, he would have been equally haughty. As it was, they regretted his departure. Mrs. Hyde rather congratulated herself that the young squire could no longer come "loafing" about their premises, making Annie idle and "above her work."

Rex was to start by the mid-day express, so that his last meal with his sisters was breakfast. I was an unusually merry one, for each vied with the other as to who should be the most animated and say the wittiest things. It was but a false gaiety, but it prevented the real sadness which possessed them from appearing on the surface.

The first break in any family must of necessity occasion sadness, and these three young people had been all in all to each other for a long time now, and both sisters' hearts were heavy at the thought of their brother's departure. Reginald himself was elated and excited, and it was only when, in taking leave of Mattie, she broke down in a passion of tears on his shoulder, that his lip quivered and his voice faltered.

"Don't break down, Mattie, he said, tenderly. I will do my best, dear little Dame Burden, believe me I will!"

"Yes, yes!" said Mattie, with a sob. "And you will keep straight, dear Rex!—you will let us be proud of you, Cecil and I, will you not?"

"Keep straight! why of course I will, you anxious little sister! What harm can I get into in Uncle Henry's warehouse?"

"None, I hope, and you will write to us regularly, Rex?"

"Yes, certainly, he answered, soothingly. Don't fret, Mattie; Cecil, be a good girl, and don't let little Dame Burden mope, and mind that you are a good correspondent."

So Reginald went away, leaving his sisters very lonely and disconsolate, although Cecil fulfilled her brother's parting injunction, and did her best to console her sister. She was to all outward appearance quite indifferent herself; but old Barton could have told Mattie, who rather wondered, and began to fear that Cecil was a little heartless, that he had found her in the stables with her arms round Black Prince's neck, sobbing as if her heart were fit to break, while the horse, who seemed to understand that he had lost his master, was turning his eyes upon her in dumb sympathy, to show that he shared her grief.

Cecil was too proud to bear pity, and she did her best to shake off all outward signs of depression; but she felt Reginald's departure keenly.

In a few days came a letter from the absent brother, written in the highest spirits, and painting everything rose-color.

Uncle Henry had received him in the kindest manner, had given him a suite of rooms in his house at South Kensington—a house which was more like a palace than any ordinary residence—had told him that he was to look upon him as his father, for that he was quite prepared to accept him as a son.

"Uncle Henry is a splendid old boy," wrote Rex, enthusiastically. "He is very handsome, tall and portly, with thick white hair. His manner is perfect; kind and genial.

He is going to allow me three hundred pounds a year as a beginning, but he told me openly and frankly, that if we got on together, he would treat me as he would have treated his son had he lived. So, little Dame Burden, you need have no apprehensions for my future."

Several months passed away quietly and uneventfully at Lester, enlivened by frequent letters from Rex, always written in the highest spirits, speaking warmly of Uncle Henry's kindness and generosity, and by sundry presents from both uncle and brother. There came one day a piano for Mattie, and piles of new music, but when she wrote to thank her uncle he took no notice of the letter and Rex wrote that he did not like to be thanked.

In like manner came a perfect riding-habit and a new saddle with all kinds of improvements, for Cecil, and Rex kept both girls well supplied with books and periodicals, so that that winter passed away very pleasantly. At Christmas Rex came to see them, looking very handsome and exceedingly well-dressed with a languor in his manner at which Cecil laughed, but which she admired nevertheless. He went back to town earlier than they had expected, for the country bored him a little, although he was too good natured to show it.

The next summer he came again, but stayed a shorter time still, and after that he came no more; and although his letters were frequent, they were short and hurried, and always pleaded excess of work as an excuse for longer epistles.

And thus three years passed away, quietly, purely, blamelessly, to the two girls in their desolate old home, and not unhappily; but for Reginald Lester, in that great city, full of temptation to sin and excess, how did the months pass?

We shall see.—To be continued.

BRIC-A-BRAC.

MUTUALLY IMAGINATIVE.

"GOOD-MORNIN', Miss Katie," said young Mickie Fee:
"Good mornin', again: it's yourself shure I see,
Lookin' bloomin' as iver." But Kate turned away
As she said, "Mister Mickie, I wish you good-day.
You're a heartless desaver—now don't spake a word!
Pretty tales about you and that Norah I've heard.
You know you danced with her the day of the fair,
And praised her gray eyes and very red hair,
You called her an angel; quite in love with her fell:
And at night when you parted, you kissed her as well!"
Then young Mickey gave a sly wink as he said,
"I desaved her, my darlin'—this way turn your head—
Yes, faith, I desaved her; my darlin', it's true;
For I shut both my eyes, Kate, and fancied 'twas you!
Yes, that's what I did;
Katie, it's true;
I shut both my eyes,
And fancied 'twas you!"

"Well, I've no time to stay, so good-bye, Mickie Fee,
You may desave her, but you don't desave me;
I'm not to be blarneyed. Mick, a word in your ear;
You had better be off, for my dad's comin' here."
"Oh, your dad's comin' is he? That's not him I see
Now bobbin' behind that owld blackthorn tree?
For it's Paddy Mahon!" "Oh," said Kate, with a sneer,
"You've got your eyes open at last, Mickie dear.
And shure you are right; 'tis my own darlin' Pat,
So take my advice, Mick, and get out of that;
For he's comin' to coort me. Now listen, my lad:
When that boy kisses me, O won't you be glad?
For when his lips meet mine, why, what will I do?
But shut both my eyes, Mick, and fancy it's you.
That's what I'll do
Mickie, it's true;
Shut both my eyes,
And fancy it's you."

DISAPPOINTED.

THERE is nothing like presence of mind after all. One dark, rainy night, old Dr. Botts, who lives on Van Ness avenue, San Francisco, was trudging homeward, when he discovered that he was being dogged by a burly ruffian, evidently intent on robbery. They were in a lonely part of the town, and the man was just at his heels, when the doctor buttoned his coat up to his chin, suddenly turned back, and said to his pursuer:

"Please, sir, give me a dime to buy something to eat. I don't want to get whisky, indeed I don't; haven't had anything to eat in two days."

"Great Scott!" exclaimed the footpad, re-pocketing his slungshot with profound disgust, "to think here I've been piping off a pauper for over a mile."

And he walked off swearing at his luck.

LINES TO A HEN.

FARE thee well, and if forever,
Still forever fare thee well;
Since 'tis clear I can't digest thee,
'Gainst thee I must needs rebel.

Now that breast is bared before me,
Which so long on eggs hath sate,
That you've worn off all the feathers,
And 'tis bald as any pate.

Could that breast by thee worn barren,
Under heavy weights be put,
It would show a stout resistance,
Of a ton to the square foot,

Oh, 'tis hard to tear asunder
Fond attachments of the heart!
But with a strong yoke of oxen
I could not pull thee apart.

There are words of deep emotion,
That most any thing subdue;
But there's no language so tender
That, old hen, will soften you.
—Weekly Gate City.

YESTERDAY AND TO-DAY.

"HOLE on dar," said a colored man, hailing an acquaintance. "Does yer cross de street ebery time yer sees me ter keep frum payin' dat bill?"

"No, I doesn't."

"What fur, den?"

"Ter keep from bein' axed fur hit."

"Mr. Napoleon," said the creditor, "I lent yer $10 three weeks ago. Yer promised an' promised ter pay me. De udder day you say dat 'pon yer word an honor as a gen'leman yer'd pay me ter day. Now, what's yer got ter say?"

"I al'ers zerves my honor. Yer's getting yer lack of flosofy and my honor mixed."

"How's dat?"

"Doan yer know dat de oder day all de time in town was changed? Da foun' dat de time was wrong an' dey sent off an got what da calls a transit apperatus. Since den all de watches an' clocks hab been overhauled. Hit hab been foun dat our time is gis one day too fast."

"Dat's got nuthin' ter do wid my money."

"Course it hab. I promised ter pay yer ter day. The overhaulin' ob der time shows dat dis ain't ter day."

"How does yer make dat?"

"Why dis is ter-morrow. Doan yer see! Let me tell yer, if yer goes roun' dis town showin' such ignunce ob flosofy de people will laugh at yer."

"When is yer going ter pay me?"

"Jes ez soon ez we kin git the time straightened up. Da's workin' on it now. Jes take my advice, fur et de people onst gits it inter dar heads dat a man is a fool, ten years ob knowledge won't change it.—Little Rock (Ark) Gazette.

HOW TO ASK AND HAVE.

"Oh, 'tis time I should talk to your mother,
Sweet Mary," says I;
"Oh, don't talk to my mother," says Mary,
Beginning to cry;
"For my mother says men are deceivers,
And never, I know, will consent;
She says girls in a hurry who marry
At leisure repent."

"Then, suppose I would talk to your father,
Sweet Mary," says I;
"Oh, don't talk to my father," says Mary,
Beginning to cry;
"For my father, he loves me so dearly,
He'll never consent I should go—
If you talk to my father," says Mary,
He'll surely say 'No!'"

"Then how shall I get you, my jewel?
Sweet Mary," says I;
"If your father and mother's so cruel,
Most surely I'll die!"
"Oh, never say die, dear," says Mary;
"A way to save you, I see,
Since my parents are both so contrary—
You'd better ask *me*." —Samuel Lover.

FINE COOKING.

THE dissatisfied boarders at Mrs. O'Rourke's house on Howard street were very much astonished the other day at beholding that amiable landlady bring in a leg of mutton in which were stuck a number of peacock feathers, supplemented by a dazzling array of gilt pasteboard stars.

"Begorra, we'll have no more grumbling about plain cooking in the house. Look at that, now! Can they bate that at the Poodle Dog, wid all their parley voo fixings? Ye'll foind I kin be as Frinch as the bist uv them, d'ye moind that!"

ODE TO A FISH WORM.

UNLUCKY creature! When the cruel hook
Impales thee, ere I plunge thee in the brook,
Thou canst not by an agonizing yell,
The fearful tortures thou endurest tell.
Thou canst not, by thy countenance, express
Thy awful suffering and dire distress.
'Tis only in thy power to twist and squirm,
But I can tell what that dost mean, O worm!
And shall I all this pain inflict on thee?
No; I'll show mercy.—Ha! What do I see
In yonder pool so deep? It is a trout!
A big three-pounder! I must have him out!
For what are you to such a prize, O worm?
Thy hour has come! Get on that hook! Don't squirm!
Ha! You resist me? 'Twill avail thee naught.
That trout still waits for thee. It must be caught—
Oh, drat! I've dropped the worm, and too, by swum,
That cussed hook I've baited with my thumb!
Confound the thing! I've lost that worm, and more,
The trout made off the minute that I swore.

THE ENGLISH SPARROWS.

"So when in bed at morn I lie,
And twist and turn, and vainly try
To get an extra forty winks,
'Tis then, O sparrow! that methinks,
While listening to your chattering song—
More tuneful than a Chinese gong—
I'd like to stroke your downy coat,
And put my hand upon your throat,
And wring your neck—though ne'er were heard
Again your song, dear sparrow bird."
—Boston Transcript.

OH, wad some power the giftie gie us,
To treat the musquito as the musquito treats us,
It would frae manifold sufferings free us,
And give our nails a chance to grow.
—Sandie Stone.

THE EYE OPENER.

The United States Washing Machine, made by Lyman & Co., 104 and 106 John Street, this City, and largely advertised throughout the country by means of circulars and postal cards, is a worthless humbug for all practical purposes. We are constantly receiving inquiries about this thing and trust this notice will be sufficient for at least a month or two.....N. S. Mayes & Co., Sweetwater, Tenn., are again flooding the country with circulars advertising a recipe for making sorghum sugar; Normandy White Corn, Mammoth Spring Wheat, Peach Tomato, etc., etc. In answer to an inquiry, a trustworthy gentleman in that town writes us that no such circulars are distributed in that section, and that the whole advertisement is, *of course*, a humbug.....With the sale of harvest products, swindlers are already sending out advertisements, especially through the West and South, offering glorious chances for realizing fortunes for a small sum entrusted to their care. The alluring schemes are generally based on the same principles as the "put," "call" and "straddle" swindles exposed here at length last Spring except that grain and cotton, and sometimes pork or other products are substituted for railroad and other stock. Of course, any sensible man will have nothing whatever to do with such knaves, however plausible their schemes and the presentation thereof.....An electric lamp for $1, is a Chicago humbug in that the handsome advertisement that sets forth its brilliant merits leads the reader to believe the lamp will be complete on its arrival; whereas it's the glass and stand alone that are sold—and the buyer too. With these is sent another circular offering ready-made electric batteries, or the materials for making them, for an additional sum, the clumsy lamp being perfectly useless without the electric apparatus. The whole thing is a fraud, and "The Scientific Toy and General Novelty Co., who make it, a rascally concern.....Boyd's Electric battery was exposed here as a humbug several times in the Spring and early Summer, yet folks persist in sending us additional inquiries about the thing. Two other humbugs of the same nature are Dr. Rhodes' Electric Transfusing Battery, and "Professor" Cauldwell's Magnetic Galvanic Battery. These bear so strong a resemblance to the Boyd humbug that one would be justified in believing them identical, the *names* of batteries and advertisers alone having been changed. At any rate they all three belong to the same disreputable family.

IDLERS, TO THE FIELDS!

THE professions are full. "There is always room at the top," but in them there is no vacant place which the man of ordinary gifts may hope to fill. Lawyers without briefs, clergymen without congregations, physicians without living patients—certainly we have enough and to spare of these in every city and village.

"Living by one's wits," which has been to many a pleasant and profitable business in times past, is not now an inviting one. Money is too scarce, people are too suspicious, too cautious, too calculating. We want no more merchants. Every village has two where there should be but one, and our cities swarm with bankrupt traders and starving clerks.

It used to be said that "he who has a trade is safe." He was, once, it is true; but everybody knows he is not now. A large percentage of the men now out of employment are skilled artisans, who, through long years of experience have become good carpenters and masons and millwrights and shop hands. They are idle now, not because they are not good workmen or because there is not work to be done, but because machinery is doing the work they used to do.

Statistician tells us there are in use in this country alone 100,000 planing machines, which, when in operation, do the work of 10,000,000 carpenters shoving laboriously the old-fashioned implement for making shavings; in other words, that one of these machines will turn out just as much finished work per diem as 400 men, skilled in that particular form of industry. The same authorities inform us that the number of sewing machines in the country is about 4,000,000, capable of performing the work of 100,000,000 sewing-girls, operating with needle and thread by hand; that a single boot and shoe factory in Massachusetts averages the production of 6,000 pairs of pedal coverings daily throughout the year; that when running full, the 1,300,000 cotton spindles of Fall River manufacture more yarn in one day than 6,000,000 persons could do in the same time, the latter operating with the old-time spinning wheel.

To issue 100,000 copies of a newspaper daily, using the appliances of fifty years ago, would require the making up of 180 "forms," and the services of 7,000 compositors and 1,000 pressmen, inkers, etc. All this makes clothing and houses and reading and other necessaries of life cheap, but it has reduced the demand for skilled mechanical labor to a mere fraction of what it would have been had "the human machine" been left to do the world's work alone.

And now the population of the earth, or of our country at least, must shape its labors to meet the changed condition of things. The young man who stands upon the threshold of active life querying what he shall do, finds, as we have said, the professions full, the stores and exchanges swarming with bankrupts, and the way to the factories and shops crowded with idlers who only want an opportunity to work.

But the fields are not full. If our counters are filled with goods for which there is no demand and our cities are full of houses for which there are no tenants there is no glut of food in any of our markets, and for all which labor can coax from the earth, for everything which the intelligent worker can gather from the soil there is a call. There is one calling which is not full. New Hampshire, which passes for an agricultural State, produces but three-fourths of the food she consumes, and leaves thousands of acres of her soil to grow up to bushes or to return less than half the crops they should. And while doing this, merchants stay behind their counters until the sheriff locks the door, mechanics stand about the street corners and complain because they can get no work, and young men grow into chronic loafers because they can't "find an opening." And what is true of our State is true of others. Isn't it about time there was a new departure, a turning from the factory to the field, from complaining and suffering idleness to cheerful, earnest, food producing work on the farm?—Mirror.

For Women.

CONDUCTED BY MISS RAY CLARK.

VIOLETS.

VIOLETS! violets! bring me blue violets!
Violets wild as my own mountain air;
Bring them from shadow-nook,
Down by the meadow brook,
Some for my bosom and some for my hair.

Violets! violets! bring me blue violets!
Violets wet with the sweet shining dew;
Low where the zephyrs pass,
Gay o'er the growing grass,
Lift they their faces, love, waiting for you.

Violets! violets! bring me blue violets!
Violets fresh from the shadowy woods!
Life holds them slenderly,
Gather them tenderly;
I would have no other gems if I could.

Violets! violets! bring me blue violets!
Violets bright from the far-forest gloom;
She of the golden hair
Sought for them everywhere,
Only to garland herself for the tomb.

So they are dear to me, timid, wild violets!
Dearer than diamonds the costliest are;
Bring them with tender hand
Up from the shadow-land,
Some for my bosom, and some for my hair.

A PEEP INTO MY LIBRARY.

IT is not about books nor authors but about "house millinery" that I would discourse, and if you will but "step into my parlor" gentle reader I will engage to show you a few artistic oddities in the way of decoration.

To begin with, the windows are my especial delight and I have indulged in no end of self glorification over them.

I was sorely puzzled at first as to whether I could possibly get along without window drapery of some sort, and I had nearly decided in favor of linen curtains with antique lace, insertions and borderings, when I was tempted to try my hand at "home-made" stained glass.

I invested in some sheets of patented silk paper printed with brilliant oil-colors—which comes for the purpose—and pasted them on the window glass. I had selected small designs in which crimson and yellow predominates. The effect is exquisite and very closely resembles that of costly colored glass. I have neither blinds, shades, nor curtains and yet the room is never unpleasantly light.

Near the window stands a small table over which is thrown a table *scarf*. This is a half yard wide and a yard and a quarter long, made of old-gold satteen with a band of plush at each end embroidered in English crewels. On the table is a Marguerite banner-screen made of old-gold, satin-finished stuff and represents Marguerite straying beneath the forest trees, picking the petals from her daisy, while the softly blended lights of green and gold fall around her slender form.

The mantel lambrequin is made to match the table scarf, as to materials and colors. In this, the satteen has the story of Cinderella worked in outline in panels with the plush between.

I have a book-case of course but for that I am indebted to the cabinet maker. Not so, however

with the curtain for the open book shelves. This is of crimson brocaded silk. The hem is finished with a facing of butter-cup, yellow silk, from which spring tufts of conventional buttercups embroidered in floselle.

My scrap basket trimming is made of linen momie cloth with a drawing outlined on it, and finished with narrow velvet fringe and small balls. A bracket which is ornamented with quilted blue silk, crimson velvet and a fringe of blue crimson and old-gold, holds a small engraving "From an Unknown Shore" which represents a lovely baby afloat on a shell.

Another bracket has an "ace of clubs" which is made by grouping three brilliant little open Japanese fans stem to stem. For the rest there is nothing strikingly original about the room, except possibly the cover of a large table which stands in the center. It is of crimson cloth edged with heavy bullion fringe of the same shade. Around the border is inserted a broad band of crimson plush closely worked with an arabesque of gold colored silk. In any of the foregoing decorations linen and cloth and crewels may be effectively exhibited for the richer and more expensive materials I have employed.

To some it may appear that by confining the hanging to one of two colors, viz: old-gold crimson, the effect is monotonous. This not at all to be desired result, is obviated by the brilliant and varied hues of the embroideries. In another letter I may have something to say of decorations for napery and for infants' bed spreads.

ART AMATEUR.

SMALL CONVENIENCES.

"I MUST give up getting a new parlor carpet again this year," said Phebe, rather discontentedly; "I did hope to see my way clear to pay for it this Fall, but it seems as far off as ever."

"Well," said cousin Abby, philosophically, "just think how much hard work it will save you; it's dreadful hard work making up a carpet."

"I'd be willing to undertake it for the satisfaction afterward."

"I know," said Abby, consolingly, "that it is a real, solid comfort to put down a new carpet, but, still, child, you can get a good deal of satisfaction out of much smaller possessions. Just give me a quarter to invest for you to-day when I go into the village, and see if I don't bring back what will in the long run give you as much comfort as a new carpet."

Phebe was amused and a little curious to see what Abby would bring, so she handed out the quarter of a dollar, with a laugh, and told her she expected to be made rich on the proceeds of that sum.

Abby had been helping around the house for a week and saw what a dearth there was of small conveniences She walked at once to the "five cent counter," a wonderful institution which has sprung up like magic all over the land within the past two years. She remembered the handleless shovel at Phebe's house and laid out a new article of that description the first thing. She thought of her scorched fingers trying to toast bread that morning, and a toasting-fork was added. "When Phebe has mashed potatoes once with this wire potato-masher, and sees how light and nice it makes them, she will never pound them into a salve again with that old rolling-pin or wooden masher." Then the long handled skimmer was just what was wanted to dish up their big boiled dinners. Dishing-up had always been such a difficult business with only a saucer and fork to manage it with. A great iron spoon finished out the quarter of a dollar; but there were so many useful articles still to be had that were so much needed that cousin Abby laid down another quarter and selected five more.

They had a good deal of fun over the purchases, and when they were all hung up in handy places Phebe said she felt as if she had just had a tin wedding. Everything came in use almost every day and meal. "I don't know how I got along without them so long," she used to say wonderingly; "I guess you are right about them and the carpet, Abby. I can do without that, but I don't see how I could without these things."

It is these "littles" that count more than one supposes in the wear and tear of life. Everything that makes labor lighter is worth having.

MRS. J. E. McC.

THE CHILDREN OF THIS GENERATION.

ANNIE L. JACK.

IT was my lot the other night, to sit for an hour listening to the glowing picture drawn by a city young man of the wealth, prosperity and pleasures of a city life. He talked of his thousands and his tens of thousands, and filled his audience with little less than awe as he rolled out the sentences that told when he lost $15,000, and how soon he re-made $25,000 in another authorized speculation.

The country youth who toils early and late with faithful diligence to help his father who is "not so strong as he used to be"—was filled with a restless desire to have his quiet surroundings, and try *his* chances in the busy life of the city. The harm of such exaggerated talk is immense in the instance I have cited, as in many others, and it is only when too late that he may in some future day

"Close his eyes to his garish rooms,
To dream of meadows and clover blooms."

This is no fancy picture; the fact, stubborn and real, is often enacted as in the home I have mentioned. Young men and boys with grand ideas of what may be, do not take into consideration the free, independent life they lead, the country pleasures they enjoy, which become luxuries often in the city, the pure air and purer food, the wealth of field and river and tree, the priceless boon of health, that no city person can so well enjoy, with many hours of leisure untrammeled by conventionality or sham. But the glamor of the golden calf is upon him. Home, health, mother and a thousand associations fade and are as nothing if he becomes infected with the disease of money getting, and allows the glowing accounts of city dwellers to bias his mind.

The young man from the city leads a charmed life, the cut of his coat is in the latest style, so is the ring on his lily hand. He will show you a blister if he takes an oar or a spade for five minutes, expressing lofty disdain of "the country," converses freely on business that involves thousands. All these things are enough to unsettle a well-balanced youth, who, while well read, and conversant with the latest news, and neither awkward nor a boor, yet feels that he is being left behind in the race for wealth, the one object in life that appears to have any charm for the children of this generation.

WORLDLY MATTERS FOR GIRLS.

Entertaining.

"LET'S pretend" we live in the country; it is Winter; we are going to have a small company and we want them to have a particularly nice time, because we have been out frequently this Winter and haven't enjoyed ourselves for various reasons.

In the first place, let us have plenty of light, everything will be so much more cheerful and everybody will be in so much better spirits than if the room is in semi-darkness; then we will try and be as bright and cheery as the room. We must be sure to invite Tom C., because he is so jolly and witty, and Miss M, because she sings and plays, and as long as she is moderate in both she will be an acquisition. We will invite three or four couples beside.

We will have our refreshments early, so if there is any stiffness in the company it will certainly pass away.

If any of the party care for Euchre or Whist we will have the cards handy; then, if the rest of the company become tired of music and conversation, let's propose French charades—a little of that; then Twenty Questions—What's my thought like? Crambo, Borrow and Return, and anything else we can think of, and if they don't have a good time it will be their own fault.

Watermelon, archery parties, and picnics are just the thing now. Invite your city friends, if you have any, and in the Winter, if they play fair, they will return the compliment and give you a taste of city life.

MISS M. D.

ABOUT WOMEN.

ELIZABETH STUART PHELPS has a summer cottage of her own on Cape Ann. She is said to be annoyed by the staring of visitors who are anxious to see a live authoress.

THE lesson enforces itself. Let every young lady heed it. Miss Tellie Mateer walked with a gentleman at Mount Jersey, Pa., on Sunday, and was burned to death by a spark of his cigar.

MISS ELIZA JANE CATE was recently elected a corresponding member of the New Hampshire Historical Society—the first woman who ever received that honor. Miss Cate is a magazine writer.

QUEEN VICTORIA is so pleased with Col. Chester's book on the "Westminster Abbey Registers" that she has given him, in acknowledgment, a copy of Martin's "Life of the Prince Consort," with an autograph inscription in each volume.

MRS. JENNIE M'GRAW FISKE, the wealthy bride of Professor Willard Fiske of Cornell University, is building an elaborate new house at Ithaca. It is to be of the Medina white and Ohio sandstone, and will cost between two and three hundred thousand dollars.

ATLANTIC CITY is interested in a musical prodigy, Miss Bella Spencer Wiel, ten years old, who, in an admirable manner, plays from memory the entire score of "Il Trovatore," as arranged by Gottschalk. The young lady was taught her knowledge of the art at the Convent of the Visitation, Georgetown, D. C.

MRS. BROWN, the mother of "Artemus Ward," is mentioned by the Boston *Journal* as a bright and busy old lady of seventy years, and now living at Waterford, Me., where her son is buried. She has a great love for gardening. Her pride and affection are pleasantly shown when visitors come to look at the house where "Artemus" was born.

MRS. MARY CLEMMER is the guest, for a week, of Mrs. Dahlgren, at her beautiful Summer home on South Mountain. The feeble health of Mrs. Clemmer's father, who makes his home with her, precludes the idea of her leaving Washington for an extended sojourn, but her handsome house on Capital Hill is at all seasons airy and attractive.

HINTS.

TO CLEANSE THE TEETH.—A good way to cleanse the teeth is to dip the brush in water, rub it over genuine white Castile soap, then dip in prepared chalk. A lady says: "I have been complimented upon the whiteness of my teeth, which were originally anything but white. I have used the soap constantly for two or three years, and the chalk for the last year. There is no danger of scratching the teeth, as the chalk is prepared, but with a good stiff brush and the soap it is as effectual as soap and sand on a floor."

WASHING THE FACE.—Few people would think that there are several wrong ways of washing the face and but one right Dr. Wilson's directions are: "Fill your basin about two-thirds full with fresh water; dip your face in the water, and then your hands. Soap the hands well, and pass the soaped hands with gentle friction over the whole face. Having performed this part of the operation thoroughly, dip the face in the water a second time, and rinse it completely. You may add very much to the luxury of the latter part of the operation by having a second basin ready with fresh water to perform a final rinse."

BORAX.—Lady readers who have not tested the magic properties of borax have been losing a great help and comfort. If once used you will never be without a bottle on your toilet table. It removes stains and dirt from the hands better than soap, and at the same time softens and smoothes the skin. It is splendid for washing the hair, and will, without injury, cleanse brushes and combs in a few moments. For washing purposes it saves both soap and labor. It will extract the dirt from articles of delicate texture without rubbing, it being only necessary to put the articles to soak with a solution of borax over night, and need only to be rinsed in the morning. Two tablespoonfuls of pulverized borax dissolved in a quart of water, to which water enough is added to cover a pair of blankets, will cleanse them beautifully. It also saves great labor in washing paint. It is said to drive away ants and roaches, if sprinkled on the shelves of safes and pantries.

Ladies, do you want to be strong, healthy and beautiful? Then use Hop bitters.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

THE Summer of 1880 is among the things of the past and Autumn is upon us. Once more we settle down for the long Winter evenings and the busy mother begins to think of fingers and toes that must be covered from the frost, of garments that must be re-made, turned and enlarged or cut down for the younger members of the family. So life is one continued preparation—always looking forward, if our aim is right, for a brighter future, the only guiding star to our wearied souls. The future! thank God we do not know its dark side! We see only the brightness, and hope for the best. Meanwhile we must be up and doing. A slight tingle of frost, the comments of the children on stiffening grass at sunrise, the delight with which they bring in the first thin crystal cake of ice, all serve to remind us of duties to be done. The pickles must be made up, the last preserves packed away, and then every spare moment is spent in the work I have mentioned. In a family of girls it is only a duty to teach them to cut and fit garments for the younger ones. No matter if they do spoil a bit of cloth now and then, or make a garment that is not exact in fit, they will do better next time, and it is only practice that makes perfect. "I would give all my Latin and Philosophy" I have heard a lady say, "if I could cut and make my children's garments." I am not one to advocate close application to the needle, especially in neighborhoods where some poorer neighbor may be benefited by the work given; but "knowledge is power" in this as in every other department, and there is nothing in which economy is better seen in domestic affairs than in the sewing of the inmates. I always feel more like this kind of work in Autumn. There is a quiet, settled air about everything and neither oppressive heat, nor piercing cold to influence one. While on this subject, I would say that no mother should ignore the use of flannel in all possible garments for children in cool weather, a necessity that is not always felt, but should be in this variable climate. Warm, bright, woolen garments are a saving every way, but in nothing more than in the health of those who wear them.

SUGGESTIONS ON HOUSE-BUILDING.

THE good "RURAL" came to-day and in it I see Mrs. B. is going to build a new house, and asks for suggestions. If possible, have a closet opening off from every bed-room and one off from the living-room. Let the closet doors swing outward into the room; have a shelf put up in the closet over the door as long as you can have it and wide enough to hold your band-boxes, etc. In arranging your bedrooms have one large enough to hold two beds; this is especially convenient in case of sickness, or where there are small children in a family. One of the beds might be a three-quarter size. I have two such in my family, and they are very convenient. Calculate so as to have plenty of room to stand up your beds, so that a window or even part of one will not be against the bed. A window throwing light directly into the eyes of the sleeper is undesirable. If you cook and eat in separate rooms, have a china closet built in the wall between the two rooms, with doors on both sides, so that you can set the table without carrying dishes from another room. If you eat in the kitchen, have a cupboard built in your pantry with tight doors to keep dishes in. For eatables a movable cupboard with wire-netting sides and doors is best. Calculate spaces for your larger pieces of furniture, so they will not come against windows—have a place for the baby's crib out of the way of drafts or strong light. Have the organ stand well away from the stove, and, if possible, against an inside partition wall, your writing table and book-case where the light will fall over the left shoulder of the writer, and your lounge or sofa where the little ones can play on it and be warm in the Winter. Try to have everything arranged so as to save steps, and have the house pleasant inside. Wishing Mrs. B. success and pleasure in her enterprize, I am,

Respectfully, MRS. H. H. SWEET.

LIGHT REFRESHMENTS FOR EVENING PARTIES IN THE COUNTRY.

Saratoga Punch (strictly temperance). Grate the rind of three and squeeze the juice of six lemons; add water the same as for ordinary lemonade, sweeten to taste; then add six eggs, yelks and whites beaten separately, and serve. This makes a delicately frothy drink, which everybody appreciates. *Pop Corn Balls.* Have ready a six-quart panful of nicely popped corn; boil one pint of New Orleans molasses, one-half cup of sugar, and a tablespoonful of butter, until it hardens when dropped in cold water; then stir in the popped corn and with buttered hands work into balls, and put away to cool. *Saratoga Cake.—White part.* One-half cupful of butter; one and one-half cupfuls of white coffee sugar; one-half cupful of sweet milk; two cupfuls of flour; the whites of three eggs beaten to a froth; a heaping teaspoonful of baking powder; flavor with lemons; bake in two round tins. *Fruit part,* a quarter of a cupful of butter, one cup brown sugar, quarter cup sweet milk, one cupful of flour, one-half cupful each of raisins and currants, chopped fine, two even teaspoonfuls of baking powder, the yelks of three eggs Bake in one round tin. Make icing with the whites of four eggs, sugar and lemon flavoring. Place on cake dish—in the following manner—first, a layer of white, cover with icing; then the layer of fruit cake, cover also with icing; then the other layer of white, cover with the rest of your icing. A bunch of flowers placed on the cake makes a pretty finish.

MISS M. D.

DOMESTIC RECIPES.

Mushrooms.

TO BROIL.—Peel and wipe with flannel those that are large and fresh, cutting the stems close. Dip into melted butter, season with pepper and salt, cover and let stand from thirty minutes to an hour. Then broil on a fine gridiron over a clear fire; butter again and serve at once. If you please, squeeze over them a few drops of lemon juice.

TO STEW.—Take small ones, of uniform size, rub clean and white with a wet flannel, and cut off the stalks. Put into a porcelain saucepan, just cover with cold water, salt, bring to a boil, then stew gently 15 minutes. Pour off a part of the water, stir in a half tablespoonful of flour rubbed smooth in a tablespoonful of butter, boil a minute or two, add three tablespoonfuls of sweet cream, draw to the back of the stove, stir a minute or so, then serve.

TO BAKE.—Wipe and rub clean, cutting off nearly all of the stalk. Arrange, tops-down, on an earthen pie-dish, season with pepper and salt, drop a bit of butter upon each, and bake in a moderate oven for about thirty minutes. Baste several times with butter and water, that they may not be dry. Serve with drawn butter, to which has been added the juice of a lemon.

TO STUFF.—Skin or rub clean ten large mushrooms and cut off the stalks. Dress, then chop fine eight large mushrooms and one eschalot. Put two small spoonfuls of butter in a frying-pan, let it become hot, then in it brown the chopped eschalot and mushroom. Season with pepper and salt, and stuff the centers of the 10 peeled mushrooms with this mixture. Place on a baking dish, sprinkle fine bread-crumbs over all, and bake half an hour in not too hot an oven. Baste with a little melted butter and water. Good with lemon juice.

TO PICKLE.—Use button mushrooms, clean with flannel, cut off stalks, throw into salted hot water, and boil *gently* 10 minutes, drain, turn into a clean cloth and cover with another. Put into bottles, with a blade or two of mace and a dash of Cayenne, and cover with white vinegar. Seal tightly.

CATSUP.—Put alternate layers of salt and cleaned mushrooms in an earthenware dish, using one-fourth pound of salt to each two quarts of mushrooms. After six hours break into small bits and set where it is cool for three days, stirring twice a day. At the expiration of the time strain the juice and to each quart add one-half ounce each of ground allspice and ginger, a half teaspoonful of mace, and a teaspoonful of Cayenne pepper. Put into an earthen jar, set into a kettle of boiling water and boil five hours. Take out, pour into a porcelain kettle and boil gently half an hour longer. Let it stand in a cool place 24 hours to settle. Pour off the clear liquor into small bottles, cork and seal tightly.

The greatest appetizer, stomach, blood and liver regulator on earth—Hop Bitters.

News of the Week.

HOME NEWS.

MONDAY, Sept. 13, 1880.

THE steamer Vera Cruz, plying between New York and Vera Cruz, Mexico, was overtaken by a terrible gale off St. Augustine, Florida, on the 28th ult. and went down, and all but 11 of the 82 persons on board were lost. The vessel was supposed to be perfectly safe and capable of weathering the severest gales, but there are reports of neglect to perfectly trim the ship in loading the cargo..... The Illinois Central Railroad has paid $36,563,344 in dividends and reduced its funded debt to $10,300,000 in 20 years.....In a patent suit instituted by the Washburn and Moen M'f'g Co. against Haish, with regard to barbed wire fence, it has just been decided in favor of the W. & M. M'f'g Co, that, 1, A person has no right to mark his goods with any words or terms indicating that they are manufactured under a patent which he does not own and has no right to use. 2, A defendant, having so marked his goods, will not be allowed to defend himself by denying the validity of such patent.... John Shenk, a well-known farmer in Conestoga township, Pa., committed suicide by hanging on the 7th.....Martin Hagens and John Reesman, of Altoona, Pa., were run over by cars, near Petersburgh, on the 5th and killed.....Albert Griswold, a prominent citizen of Pike County, Pa., was killed by the cars at Rowland on the 7th.

The Palisades Hotel at Oakland, Cal., was burned on the 8th. Loss, $50,000.....Mrs. Harvey Holmes, of Monticello, N. Y., drowned her child on the 7th, while laboring under temporary insanity.....The boiler of a mill on Lowenburg's place, at Lake Concord, Miss., exploded on the 9th, killing William Poole and scalding four negroes.....Captain Alexander M. Hamilton, who committed suicide by shooting at Harrisonburg, Va., on the 9th, was a brother-in-law of Cyrus McCormick, of Chicago.....R. Q. Adams, the defaulting ex-Postmaster of Deadwood, D. T., who recently escaped from custody after conviction of embezzlement, has been captured at Fort Sully.....The hurricane of the 29th and 30th ults. was very destructive in the Bermudas, incalculable quantities of fruit being destroyed, in addition to much damage done to buildings and vessel property.

There was a heavy storm at Petersburg, Va., on the 8th. The custom house was struck by lightning and several persons were stunned. The Galt Street Presbyterian church was damaged. A number of employes of the Western Union Office were stunned. A bookkeeper in a bank was knocked from his seat, and his pen was melted by lightning. A number of trees were uprooted. The roads in the adjacent counties were washed out. The wires between Petersburg and Richmond were prostrated.... ...Dr. Thomas E. Williams, a promising young physician of Texas, was run over by a railroad train at Meridan, Miss., on the 6th, and instantly killed.....On Sunday night Homer Richards, formerly Captain of the Leadville (Col.) police force, fatally shot Edward Jones as the result of an old quarrel.....Fire destroyed Simpson's knitting factory at Toronto, Ont., on the 5th .....Calvin Warren was killed by Bruce Green in a fight on at Lakeman, Mo., on the 6th .....The annual session of the American Social Science Association opened at Saratoga on the 6th.

The American Gynecological association began a three days' session in Cincinnati on the 6th..... Two short line railways will soon connect the twin cities of St. Paul and Minneapolis with double steel tracks and half-hourly trains, which are expected to cover the ten miles in fifteen, ten or even seven minutes.....Eight prisoners confined in the Clinton county, Ia., jail, during the absence of the jailor, overpowered and gagged the turnkey and escaped. They carried off the turnkey's revolver and pocketbook.....Colored men were drawn on the grand and petit juries at Louisville, Ky., on the 6th for the first time.....A whirlwind at Richmond, Va., on the 5th, did great damage, and another storm prevailed there on the 8th.....The Free Thinkers' National Convention has just closed a five days' sessionat Hornellsville, N. Y. The average attendance was about 1,000. Nearly every Northern State was represented, and some of the Southern States and Canada. The principal speakers were Colonel Robert G. Ingersoll, Hon. Elizur Wright, George Cheyney, Parker Pillsbury, Amelia Colby, J. H. Burnham, Thaddeus B. Fakeman, C. Fanny Allen and Lucy N. Coleman. It was considered the largest and most important convention of the kind ever held in this country.

POLITICAL.

Arkansas held a State election on the 7th, electing the democratic State ticket and defeated the proposed constitutional amendment.....The State election was held in Vermont on the 4th and gave an increased republican majority for the State ticket.....

THE WORLD'S FAIR.

The subscription books for raising the first one million dollars necessary to the perfection of the organization of the world's fair exhibition at New York city in 1883, will be opened at the Farmer's Loan and Trust Company in New York city on September 15th. Already enough has been ascertained to show that the amount will be easily obtained. In the selection of a site there has been a very earnest discussion of the advantages and disadvantages of locations to be had, and there seems to be but little further to be said upon that subject, there being one or two points of acknowledged advantage over all others, and the general conclusion seems to be that the site will be on the shore and perfectly accessible by both railroads and river craft of all kinds, probably at Port Morris.

The bogus medical diploma manufacturer, Dr. Buchanan, has been arrested and was on the 12th safely lodged in jail at Philadelphia.....Though the population of Ohio has not yet been made known, it has been estimated, from the partial returns published, that it will reach about 3,200,000. .....The growth of Illinois since the admission of the State in 1818 has been marvelous. The first railroad which brought into the State either passengers or freight was after 1850, or less than thirty years ago, and during these thirty years the population has increased from 860,000 to more than 3,000,000.

The Post Office department has received telegraphic advices from Gainesville, Fla., stating that a severe storm swept over the central portion of Florida on the 1st and 2d instant. Post roads were flooded, bridges washed away, and mail communication seriously interrupted between Ocala and Tampa, on the west coast of Florida..... ....Leadville bullion shipments this year, to September 1, aggregate $10,165,000. For the month of August, $1,296,352... ....The telephone has only been invented five years. Yet its owners can afford to hold a convention at Niagara Falls. .....Unofficial estimates of the census of 1880 show a population of about 50,000,000 for the United States, an increase of 11,700,000 since 1870 or about 30 per cent.

FOREIGN.

In Ireland the anti-landlord and anti-House-of-Lords agitation is still active. Mass meetings of the peasantry are being held in different parts of the country, at which violent speeches are constantly inflaming the public mind. Outrages in the shape of attacks and threats against resident landlords and still more against the agents of absentees are matters of weekly, yea, of daily or rather nightly occurrence. Those who take the farms of evicted tenants are ostracised by the neighbors, threatened with a dire fate and frequently flogged or otherwise maltreated, while their stock are often killed or maimed, and their crops injured. The excellence of the harvest seems to have very little effect upon the popular passions, though harvest work just now, by giving employment to the people, lessens the number of public meetings.

In Turkey there has just been another change of ministry—but these are so common that they excite little interest. Kadri Pasha, who last June succeeded Said Pasha as Prime Minister, has been replaced by his predecessor and all the Cabinet has been renewed. The new ministry is considered intellectually inferior to the old, and it owes its origin to mere court favor. The Powers have delayed that naval demonstration in Turkish waters to give the Porte an opportunity to surrender Dulcigno to Montenegro. Then the cession of territory to Greece will be the main topic of dispute, after which England is likely to insist on internal reforms in Asia Minor and Europe.

In France the agitation about the religious societies still continues. The Societies have signed an agreement to confine themselves strictly to religious matters and not to speak against the present government, but the extreme Republicans insist on their expulsion and advocate the abolition of the concordat with the pope. In Germany the great annual military manœuvers which are to take place near Berlin absorb public attention in the Fatherland and excite great notice elsewhere. They will be of unusual importance. Cologne cathedral is just about to be completed, the foundation having been laid more than 600 years ago. There was a tradition that it never would be finished. Its cost is $10,000,000. The Emperor and all the court will attend the celebration of its completion. What is German news with Bismarck's name left out? Well, Bismarck is taking a holiday. In Spain the birth of a young princess has disappointed millions who hoped for a prince. In the absence of such in future this baby may in time be queen of Spain, if she survives and revolution doesn't exclude her.....Forest or brush fires are doing an immense amount of damage in the province of Montreal, Canada.

In England the Hares and Rabbits bill has been passed by both Houses of Parliament, and must afford considerable relief to farmers. It allows them to kill ground game on their own land at certain seasons of the year and hours of the 24. It is thought that it is only the first step towards the final abolition of the game laws. Strikes are again commencing among miners and cotton spinners. In order to maintain her supremacy in foreign markets it is absolutely necessary that Great Britain should undersell other nations, as the reputation she used to have for better goods, is fast disappearing owing the wide adulteration of manufactures now practised. To sell cheaply, it is necessary to make cheaply and this can only be done by lessening the wages of the workmen; for, of course, lessening the profits of the employers must not be thought of—unless under necessity and then only for as short a time as possible. There was a terrible mine explosion at Sheaham colliery in the north of England, in which 130 lives were lost, by an explosion of foul gas in the pit which afterwards took fire in several places, while upwards of 200 men were working below. Fifty-nine were saved and the rest fright fully mutilated and killed along with some 300 horses used to haul coals down in the pit galleries. Lady Burdett-Coutts is still unmarried and has been made sick by the prosecution to which she has been subjected.

.....The German authorities are purchasing largely in England for cavalry mounts: at the great horse fair of Horncastle over 1,200 were bought, ... The British arms have been overwhelmingly triumphant in Afghanistan. Ayoob Khan has been utterly routed by Gen. Roberts after his splendid march from Cabool, during which it was prophesied he would be hampered and delayed, if not defeated, by guerrilla bands of Afghans. He marched rapidly, however, and easily beat off all assailants. A couple of days after his arrival at Candahar he attacked the Khan, who had withdrawn to a strong position near the city. The British outflanked him, however, and after a couple of hours' fierce struggle drove his army pell-mell, captured all his cannon, and slew vast numbers of his fleeing followers who were pursued for 20 miles by the English cavalry. Ayoob himself fled early in the contest with a handful of men, and started for Herat whence a couple of months ago he hopefully started. According to this morning's cablegrams his former adherents there have revolted, and he will meet with either a very cool or an exceedingly hot reception. The trouble now is what to do with Afghanistan—abandon it entirely or hold on to a part of it?

[Chicago Tribune.]

Mr. Ira Brown, the enterprising real estate man states that he could and would say a good word for the St. Jacobs Oil, which had cured him of a severe attack of inflammatory rheumatism that all other treatments had failed even to allay.

AGRICULTURAL NEWS.

At Exeter, England, a young farmer has just been sent to jail for a month for shooting a rabbit on a farm of his own occupation, while a man brought before the same bench for brutally ill-treating his wife was fined five shillings.....Practical plowing by electricity is now practiced on a beet-growing farm in Des Maine, France.....The vintage of the Rhine is said to be only eighty per cent. of the usual yield..... Two American vessels loaded with grain have arrived at Reval, Russia..... The French agricultural authorities estimate that the French harvest will be a good average; those of Roumelia, Upper and Lower Bavaria, 25 per cent.; Podolia and Suabia, 20 per cent.; South Italy and Wurtemburg, 15 per cent.; Bessarabia, 10 per cent.; Hungary, Poland and Belgium, 5 per cent. above the average. The harvests of Prussia, the Palatinate, Baden, Switzerland, Denmark, Sweden, Norway, Central Italy, Holland, South Russia, Servia, and Egypt will be up to the averages, and those of Austria and Mecklenburg 5 per cent. below; Great Britain, Ireland and Saxony, 10 per cent.; Courland, 20 per cent.; Gothland, 25 per cent., and Central Russia 40 per cent. below the average.....The August rainfall in England was under an inch, against eight and five inches respectively in the two preceding years..... The Irish correspondent of the London Times writes: "The potato crop is simply magnificent. What few men can recollect seeing is now seen on all hands—fields beginning to wither naturally, without a sign of disease. This is chiefly owing to the change of seed, the 'Champions' being planted on all hands from east to west, and fully bearing out the good things spoken of them. The price of oats and cattle has doubled since last year, that of pigs more than doubled. Oats are a good crop, and turnips and mangolds never looked better."..... A dispatch from Cairo says the cotton crop of Egypt is about 15 days late and it is estimated to be 22,500,000 pounds less than last year. This is equivalent to 56,250 bales of 400 pounds each, which is an insignificant amount in the world's supply.....The London Standard's correspondent at St. Petersburg telegrapns that competent authorities say that the Russian harvest is the worst since the famine of 1873; but it does not follow that Russia will have no grain to export. The latest reports from Odessa, which is the main exporting center, are to the effect that the crops were pretty good in that section of the country. .....The London Gardener says the fruit crop in England is a failure, especially apples, except the cooking sorts .....The Wartha has followed the grim example set her by the Odor, the Elbe, and other German rivers, which, overflowing their banks, have wrought destruction over an immense extent of country. The damage inflicted by floods in Upper Silesia is terrible..... Canada's surplus of oats is estimated at 7,500,000 bushels.....Dr. Law of Cornell University, has found Texas fever among a herd of cattle at Oswego, N. Y. Ten cows had died before the 6th inst. .....It is believed that the tobacco crop of Pennsylvania will reach the enormous value of $8,000,000 the present year. Lancaster and York are the two leading tobacco growing counties ....The wool clip of California this year is estimated at 35,000,000 pounds, being a heavier yield and far more profitable than that of any previous year.....The seven colonies of the Australian group now hold about 70,000,000 sheep.....The crop of cranberries in Wisconsin is reported to be only fair, owing to the high waters prevalent during a good share of the season. The crop for the State is estimated at about 30,000 barrels..... Pennsylvania has expended thus far nearly $4,500 in suppressing pleuro-pneumonia, of which sum $2,365 were paid for killing 150 animals infected with the disease. Over six thousand examinations were made, and the special agent is said to have traveled nearly 11,000 miles in the performance of his calling. Maryland has been considered the principal source of infection, but as the State has now in operation a law for the suppression of the disease similar to that in force in Pennsylvania, it is believed that its spread in that State will be effectually prevented .... The receipts of grain at Montreal since January 1 to Sept. 1, by rail and canal, amounted to 13,245,000 bushels, a gain of over 20 per cent. compared with the corresponding period last year. The shipments were 14,394,000, against 9,661,000 for the same time in 1879.....Among the fish of the United States the cod comes first in money value, the salmon second, the mackerel third, and then the menhaden. In weight the last stands highest. Its chief use is for the manufacture of oil and fertilizers.....The Crow Indians about Keogh, Montana Territory, in recent interviews with Secretary Schurz, have expressed a desire to go on a Reservation, take to farming and become permanently settled.. ....Vennor says he already foresees "very early and severe cold."..... Experiments in raising sugar-beets are being made in Hartford Co., Md., where the soil is said to be excellently adapted to raise beets of the highest sugar-productive quality. The nearest factory, however, is at Wilmington, Del., and an effort is being made to start one at Havre de Grace.....The silk works at Patterson, N. J., have orders for all the goods they can turn out. So have the mills of Mr. Ilschner, at Kinderton, Philadelphia, Pa., and Mr. Huber's at Germantown. Large new silk works are being erected at Hawley, Wayne Co., Pa.....A late Inman steamer took to Liverpool 1,200 barrels of apples. The export of fruit is unusually large this year.... The amount of ground game *sold* in England seven years ago was estimated, from testimony taken before the Committee of the House of Commons, to be about 10,000 tons. The other day during the debate on the Hares and Rabbits bill, it was said that 40,000 tons of those animals were annually killed as game.... ...The late storm which destroyed the steamship Vera Cruz is reported to have injured the orange crop of Florida about $1,250,000. Besides destroying or greatly injuring the trees in many groves, it swept off the fruit over a large area.

THE WABASH RAILROAD ENTERS CHICAGO AT LAST.

THE Supreme Court of Illinois, on Sept. 6, decided the long-contested case of E. M. Dunbar against the Chicago and Western Indiana Railroad, reversing the decision of the lower court, and dismissing the case. Dunbar has been the representative of a number of competing railroads hostile to the entrance of the above road into the city, and the road considers this decison a final disposition of the litigation, and will immediately begin to extend its tracks to Van Buren Street. The Wabash Road has the right of running its trains over these tracks into Chicago, so that this popular railroad has now added another link to its length, which enables it to do a great deal of business connected with the fairs this Fall. It can now carry goods and passengers either to the Illinois, Indiana and St. Louis fair from Chicago, Quincy, Toledo, any of the above cities, and all points along its trunk line. This road is very favorably known for its fast time, fine cars and excellent freight facilities, and will doubtless be largely patronized by those who have goods to send to the fairs or are going thither in person. The offices of the Wabash railroad in this city are at 277 Broadway where full information can be obtained.

Forgetfulness of People.

We would not, by enticing headings and other devices lead you into reading of the virtues possessed by Pierce's Celebrated Medicines were it not that we are aware of the forgetfulness of people, and that must be our excuse, dear reader, for again telling you that Dr. Pierce's Golden Medical Discovery is without an equal as a blood-purifier. It cures all humors from the common blotch, pimples, or eruption, to the worst scrofula, fever sore or ulcer. Dr. Pierce's Pellets are a pleasant and efficient cathartic. Sold by druggists.

ST. CLOUD HOUSE, Chicago, Ill., Jan. 20, '80.

HON. R. V. PIERCE, M. D.:—Dear Doctor—I have been using your Golden Medical Discovery and Pellets for liver complaint and general debility. It is impossible to express the gratitude I feel. It is simply wonderful the effect your medicines have had upon me. I am in every way a thousand per cent. better. I am, yours gratefully,

J. C. DAVIDSON.

THE best biographies in the English Men of Letters, series—a veritable treasure-house of biography—which a recent writer describes as "contemporary men of letters on their predecessors"—are added to the Acme Library of Standard Biography, published by the American Book Exchange, New York. Ten lives are issued in two volumes, price forty cents each; at which rate each biography costs eight cents, instead of 75 cents, as heretofore. The lives selected for re-issue are Dean Church's Chaucer, Prof. Ward's Spencer, Dr. Pattison's Milton, Goldwin Smith's Cowper, Prof. Dowden's Southey, Mr. William Minto's Defoe, Leslie Stephen's Dr. Johnson, William Black's Goldsmith, R. H. Hutton's Scott and Anthony Trollope's Thackeray.

Interest in the standard favorites of fiction is by no mean diminished by the multitude of new stories that are called for in this novel-reading age. The American Book Exchange, of New York, has just issued new editions, in long primer type, and in duodecimo form, of these standard and instructive novels, Scott's Ivanhoe and Bulwer Lytton's Last Days of Pompeii. Their reappearance in such a cheap and handsome edition (50 cents each) is a good indication of the healthy literary tastes of the great army of readers who look to the American Book Exchange for literary supplies.

Winter Butter.

Let a farmer divide his white Winter butter into two lots, while yet in the form of cream, and for one make use of Perfected Butter Color, made by Wells, Richardson & Co., Burlington, Vt., while the other goes to market without color, and he will discover on what course his interest depends. This color gives the fine, rich, golden yellow of first-quality June butter, and is not tinged with the dull red tint, objected to in most butter colors.

Thousands of ladies have found sudden relief from all their woes by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND, the great remedy for diseases peculiar to females. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets. Sold by all druggists.

Hop Bitters has restored to sobriety and health perfect wrecks from intemperance.

Burnett's Cologne received the highest award at the Centennial Exhibition. It is filled in elegant bottles—glass and cork stoppered, and basket covered—and is for sale by all first-class Grocers and Druggists.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 11, 1880.

BEANS AND PEAS.—There is a fair demand for white beans, but under free supplies prices are more or less limber. Old crop lots are being hastened forward so that new may not shade them later on. Old, however, always hold a trade until good curing is assured. It is thought the new crop will turn out well though a portion of the season has been drawn for growth. A few new mediums have shown, but commercial parcels are not looked for until the end of the month. Red beans are dull and pressed for sale. Green peas quiet at $1.50@1.60 for old and new Wisconsin, the latter a job bing rate for new.

BEESWAX.—There is little doing, and the market is unsettled; quoted at 23 to 24½c. for Western and Southern.

BUTTER.—The Fall opens most favorably for butter. Stocks are small, receipts are manageable and good qualities will now arrive in lines that will accommodate all classes of trade. Steady shipments are deemed advisable so that no outlet may be killed. The crop of late years has been certain to warrant holding supplies away from positive distributing points. At the moment fine butter is not plenty and prices have advanced. Still there is a good supply of useful grades that sell down to popular rates. The wants of the week begin to enlarge with the return of excursionists. A few State dairies are selling and an early quotation may be looked for. Western butter is running poor as an average. Many of the fine lines that used to reach New York are now absorbed at points between the West and here.

Creamery, best State, 30c.; Western, 29c.; good to prime, 27@28c.; fair to good, 25@26c.; sweet cream, 25@28c.; State firkins, 24@27c; pails and half tubs, choice, 27@28c.; fair to prime, 25@26c.; poor, 20@23c; Welsh tubs, best, 26@27c.; other, 23@24c.; Western imitation creamery, 18@23c; dairy, fine fresh, 22@23c; fair to prime, 19@22c.; factory, fine June, 20@21c.; fair to prime, 17@19c; poor, 15@16½c.

Receipts for week, 33,564 pkgs.; last week, 36,875 pkgs.; exports, 16,000 pkgs.

BROOM CORN.—Prices at present are wholly nominal.

Brush and short broom, choice, ₩ lb., 6@6½c.; do., do., common to good, 5@5½c.; hurl, good to choice, 6@6½c.; do., common to fair, 5@6c.; red and crooked at 3@4c.

CHEESE.—The market has been without much life this week, and the feeling weak. The cable advices have been tame and exporters have been very indifferent, consequently supplies have accumulated. Shipments for the week, 41,800 boxes. Quotations are for

State factory, fancy, at 12¼@12½c.; do. good to prime, 12@12½c.; do. fair to good, 11@12c.; do. half skimmed, 9½@10½c.; Wisconsin factory, fine, 12¼@12½c. do. good to prime, 11½@12c.; do. fair to good, 10½@11¾c.; Ohio factory, fine, 11¾@12c; do. good to prime, 11@11¾c.; do. flat, fair to good, 10@10½c.; do. poor to fair 9@10c.

Receipts for week, 40,312 boxes; do. last week, 106,550

Exports, 33,482 do.

Liverpool quiet, 63s.

Steam, Liverpool, 40s.@47s. 6d.

COTTON.—Has been in good demand, but closed easy. Latest prices are September, 11.19@11.20c.; October, 10.78c., November, 10 65@10 66c.; December, 10 66@10.67c.; January, 10.76@10.77c.; February, 10.89@10.90c.; March, 11 05@11.04c; April, 11.17@11.18.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

Strict good ordinary	9¾	Middling	10¾

DRIED FRUITS.—The small fruits are received very moderately and there is sufficient demand for them to give a strong range of prices. Apples move out slowly.

Apples—Old State at 5¼@5½c., new Tennessee at 3½@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6@7c.; evaporated, ring cut, at 8½@9½c. Old peeled peaches at 8@11c. Blackberries at 7½@8c. Raspberries at 25@26c. Pitted cherries at 19@20c Whortleberries at 11c. New Georgia pooled peaches at 16@17c.; new North Carolina peeled peaches at 18@19c. new unpeeled peaches, quarters at 7½c. new unpeeled peaches, halves at 8c,

Exports for week, 986 pkgs. of apples.

EGGS.—Receipts for week, 7,727 bbls.; do last week, 7,300 do. Good prices have brought in free receipts from nearer points than the West. Quality continues variable, Canada run best. Market closes strong, with a steady demand,

Near points, @20c.; State and Pa. 18½@19½c. Western and Canadian fresh, 18@18½c.; off grades, 17½c.

FEED.—Sales at $15@16 for 40 to 60 lbs; $16@17 for 60 lbs; $19@21 for 100 lbs.

FLOUR.—The offerings have been liberal and prices have tended lower, but closed firmer with the stronger tendency of wheat.

Latest prices are: $3.25@4.00 for inferior to very fancy superfine state and Western; $3 75@4 00 for poor to choice extra State and Western, odd lots and lines; $4 00@4 15 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4.50@5.5; good to choice do at $5.25@5.75; (very choice to fancy do. at $5.80@6.25.) red and amber winter wheat inferior to choice trade and family, at $4 25@5 65; round hoop Ohio, $4 00@4.50; and trade and family brands of do, at $4.60@5.75; St. Louis at $4.50@5.25 for inferior to good extra; $5 25@5.85 for good to choice (and $5.10@6.25 for very choice to fancy brands); Minnesota clear, inferior to fancy at $3.85@6.25; Minnesota "straight," poor to fancy, at $5 75@7.25, and patent inferior to very fancy at $5.75@8.25; Nebraska stock at from $3.25@4 85; city mill extra at $5.00@5.25 for fair to very choice for the West Indies; do. for England, $3 80@4.15 for poor to choice spring wheat, and $4.35@5.00 for winter wheat product; do. trade and family extras, $5.25@6.50; do. for South America, $5.25@5.50.; No. 2 at $2.25@3.50 for poor to very fancy.

Receipts for week, flour, bbls. 111,450; corn meal, do, 2.85; wheat, bush. 1,502,375; corn, do. 1,384,100. oats, do. 207,350; rye, do. 16,250; malt, do. 87,500; beans, do., 4,200; rice, pkgs. 900.

Exports for week, flour 88,481 bbls.; corn meal, 4,481 bbls.; wheat, 1,280,350 bush.; corn, 1,127,300 bush.; oats, 3,600 bush.; peas, 2,700 bush.; beans, 1,900 pkgs.; rice 1,900 pkgs.

CORN MEAL.—Sales at $3.20@3.25 for Brandywine, and $2.50@2.75 for yellow Western.

FRESH FRUITS.—Apples are plenty, and a good export demand only holds them at the low prices. About 25,000 bbls. have gone abroad in the past fortnight. Red fruit meets best sale to all buyers. Peaches are in good supply for the date. White Heath run small this year. State orchards make a good addition to the offering and make very paying prices. Plums are scarce, and future sales will make up some of the losses that were suffered when buyers were away and hot weather ruined stock. Pears are in large variety: Bartletts rather scarce, B. Bost, B. Clairgeau, and B. d'Anjou, $4.50@6 as to quality. Grapes are of fine quality and cheap at quotations Watermelons have been pretty well culled out. Quinces and Cranberries are new items for the week. Not much call for the latter while apples are so cheap. Crop of cranberries reported full, though there may be some falling off in the N. Y. bogs.

Apples—Fall pippins, per bbl., 50@1.00; Alexander, $1.25@1.75; Detroit Red, $1 25@1.50; Malden's Blush, $1@1.50; Twenty Oz., $1@1.50; Gravenstein, $1.25@1 75; King, $1.25@1.50 Pears—Bartletts, fancy, per bbl., $5.50@9; prime, $7@8; other, $5.50@6; Seckels, choice, $7@8; other, $5@6; Flemish Beauty and Duchess de A., $3@4; Louise bon de J., $3.50@4; Howell, $3@3.50; Sour Bell, $2@2.50 Cooking, $1.50@2. Quinces, per bbl., $6 50@7. Grapes—Delawares, cases of 50 lbs., $2.50@3; bulk, per lb., 5@8c.; Concords, cases of 50 lbs., $1.25@1.50; bulk, per lb. 2½@3c. Peaches—N. J. extra, per basket, $2; prime, $1.00@1.50; other, 50@80 c.; Up river extra, $2@2.50; prime, $1.50@1.75; other, $1.00@1.25; Delaware Smocks, 75c.@$1 75; White Heath, 60c@$1,50, a few yellow at $2. Plums—German prune, per bbl., 1@1½; Quaces enough, 8@9c.; Reine Claude, $5@5.50; Damson, $4@5; Boston blue, $3 50@4 50; Copper, 6@7c. Watermelons, large, per 100, $20@25; fair, $15; small, $8@10. Nutmeg melons—Hackensack, per bbl., $1.25@1.75; Peanuts—The demand is small, and prices are again weaker. Va. hand-picked, per lb 4¾@5c.; extra prime, 4c.; good to prime, 3½@3¾c.; shelled, 4@5½c. Cranberries—Cape Cod, per bbl., $6@7.50; N. J. boxes, $1 50@$2.

GRAIN.—Wheat has been fluctuating, ruling lower but closing firm on an increased export demand. Shipments for the week, 1,200 000 bush.

Latest prices are for No. 1 white at $1 04½@1.05; do. September, at $1.04¾@1 04¾; do. October, at $1.05½@1.05¾; do. November at $1.07@1.07½; do. steamer grade at $1,00½@1.02 No. 2white at $1.00½@1.01; No. 3 white at 98@99c.; ungraded white at 96½c.@$1.03½; mixed Winter at $1.03; No. 2 red at $1.05@1.06¼; do. September, at $1.05½@1.06; do., October, at 1.07½@1.08; do. November, at $1.08¾@1 09; No. 3 red at $1.02@1 03¼; ungraded red at 97½c.@$1.01½; very choice hard Spring at $1 08; No. 2 Chicago and Milwaukee spring at $1.02@1 05. Rye is scarce and quoted 95c. for No. 2 Western. Corn has been active but closed weak under full receipts; latest sales are for New York No. 2, at 51c.; do., September, at 50¾@51c.; do. October, at 52@52½c.; do., November, at 53¼@53½c.; New York steamer mixed at 51c. for car lots; New York No. 3 at 51c.; ungraded mixed Western at 49¾@51½c. Exports for the week 1,400,000 bush. Oats have been active and higher but closed weak; latest prices are for No. 1 white at 41c.; New York No. 2 white at 42@43c.; No. 3 white at 41@41½c; New York No. 1, 43c.; No. 2 at 42½@43½c.; do., September quoted at 39c bid; do., October, at 38@38½c.; do., November quoted at 38¾c. bid; No. 3 at 40½@41c.; ungraded White Western at 42@45c.; ungraded mixed Western at 40@43c.; white State at 43½c.; No. 2 Chicago at 43c.

HAY AND STRAW.—Demand is active and prices well sustained. Quotations are for

Shipping hay quoted at 75@80c.; medium to prime do., 90c.@$1; salt hay at 65@70c.; clover do. at 70@80c. Straw at 85@90c. for long rye; 55@65c. for short rye; and 55@60c. for oat.

Exports for week 1359 bales.

HONEY.—It is rather early to speak of this product, still arrivals have begun perhaps 400 cases for the week, and the figures named are only nominal.

White clover single comb 18@19c.; larger boxes 16@17c.; Buckwheat 12@14c.; extracted range 9@12c.

HOPS.—The demand is slack pending freer supplies of new. Prices are held steady. Quotations are for

	Cents per lb.

Yearlings, crop 1879, choice	22 @26
Olds, all growths	4 @14
Pacific Coast, new	none.
Pacific Coast, olds (nominal)	nominal.

OIL CAKE.—Western is quoted $29@29.50.

POULTRY AND GAME.—Dressed poultry starts off with a vim that belongs to a colder season. Prices are firm now, but with possible free supplies a sudden reaction may occur. Shippers at this season should wait for advices from responsible consignees. Turkeys, choice, ₩ lb., 14c.; fair to good, 12@13c.; Phila., dry-picked, 14@15c. Chickens, do., 18@19c.; State scalded, 13@14c.; Western, scalded, 13@14c. Fowls, Phila., dry-picked, 15@16c.; N. J. d.-p., 15@16c.; State, d.-p., 14@15c.; State, scalded, 13@14c; Western, scalded, 13@14c.; poor to fair, 11@12c. Ducks, Spring d.-p., 13@16c.; State scalded, 13@14c.; Western mixed, 12@13c. Squabs, white, ₩ doz., $2.25; dark, $1.25@1.50.

Live poultry is active with a continued call for Jewish festivities. This demand is for best stock that will readily fatten. Southern and Western ducks are small. Southern fowls are slow of sale owing to small size.

Chickens, N. J., 13@14c; Western 11@12c.; Southern, 11@12c. Fowls, N. J., 14c.; Western, 13@14c.; Southern, 11@12c. Roosters, 8@9c.; turkeys, near points, 12@13c.; Western, 11@12c.; ducks, choice, ₩ pair, 85@87c.; other, 40@60; geese, fancy, $1.50@2; other, $1.00@1.25; pigeons, 20@30c.

A good assortment of game is offering, but cooler weather is required to make stock trustworthy and create a regular demand. All good birds are firm.

Partridge, prime, ₩ pair, $1 25@1 50; soft, 50@87c.; grouse, $1.25; woodcock, $1.12@1 25; English snipe, ₩ doz, $2; Sand snipe, 40c.; grass plover, $3; wild pigeons stall-fed, $1.75@2

PROVISIONS.—Hog products have been fairly active and firm.

Mess pork quoted at $15.60@15.70 for Sept. and Oct., and $15.70@15.75 for sellers option remainder of the year. Bacon at 8-85c. for long clear, and 9½c. for short clear. Lard—Western steam at 8.32½@8.35c. for spot lots; 8.30c. for Oct; 8-27½ for November delivery. Stearine at 8¾ for choice Western. Tallow at 6¾ for prime. Beef hams at $18. Beef—extra India mess quoted at $18@20 for city; $10 for extra mess, and $9.50 for plain mess; $10.50@ 11 for packet, and $11.50@12 for family mess.

Receipts for week, beef, 860 pkgs.; pork, 1,250 bbls.; cut meats 28,650 pkgs.; lard, 5,501 pkgs.

Exports for week, beef, 2,475 pkgs.; pork, 3,975 bbls.; cutmeats 15 552,195 lbs.; lard, 5,0.6,325 lbs.

SEED.—Clover is firm at 8¼@8¾c. Timothy is quiet at $2.35. Flaxseed has sold at $1.36.

TOBACCO.—Trade has been very good both on export and home account, and prices have ruled steady. Quotations are

VEGETABLES.—Exports of potatoes for week, 6,800 bbls. The N. Y. C. R. R. will not receive potatoes in bulk this Fall. The market is steady and prices are well supported for an early Fall season. L. I. early rose, $1.50@1.75 ₩ bbl.; State do., $1.37@1.62; peerless, $1@1.12; the latter are largely included in the exports at present. Sweet potatoes are firmer. The recent storm has kept back Va. schooners. Del. River, $3; Va., $2, 0@2.75. Avoid washing sweets in packing for market shipments. Cabbage is low. Other items of garden truck bring fair rates.

Green corn, ₩ 100, 75@90c.; tomatoes, ₩ bush., 25@40c.; cucumber pickles, per 1,000 $1.25@1 50; egg plant, per bbl., 75c.@$1; string beans, per bag, 30@50c.; green peas $1.50@2.50; Lima beans, potatoe $1@1.25; flat do. 75c.; shelled, $3. turnips, L. I. 100 bunches, 75c.; Russia turnips ₩ bbl. 75c.@$1; beets, 100 bunches, $1 50; bullnose peppers, ₩ bag, 75c.; cabbage, flat Dutch, ₩ 100 @3@5; red do., $4 50; squash, ₩ bbl. 50@75c.; onions, white, $3; yellow, $2.50@2.75; red, $2.50; carrots, ₩ 100 bunches, $1,50; pumpkins, ₩ 100 $3@6; okra, per 100, 15c.

WOOL.—Quotations are essentially as last week. Demand is moderate, manufacturers apparently carrying fair stocks.

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 11, 1880.

BEEVES.—Receipts for the week 13,461 head; do. last week, 13,214 do. Receipts have exceeded the expectations of sellers. The opening sales were strong at Wednesday's figures, but prices broke ½c. before sellers could close out. The ruling rates were Texans and Colorados, 8@9c., to dress 55@56 lbs.; common to fair native steers, 8¾@9¾c.; same, good to choice, 9¾@10¾c., to dress 56@57 lbs. Exporters took 525 head. Irregular trains impeded trade; to some extent.

COWS AND CALVES.—September brings out some additional local demand; and as receipts are high prices are firmer; good milch cows quite steady at the close. Poor to fair quoted $30@40 per head; good to prime, $45@55 do.

SWINE.—Receipts for week, 21,429 head; do. last week, 23,477 do. Good corn State, 5¾@5¾. Western, same; Grassers dull and not wanted at 4@4½c. City dressed hogs, 6¾@7c.; grass, 6½@6¾c.

SHEEP AND LAMBS.—Receipts for week, 30,802 head; do last week, 35,440 do. With moderate supplies the market was quick and showed something better in prices over early sales. Sheep quoted 4@5¼c. with a few picked wethers $5.65 ₩ 100; lambs 4½@6¼c.

VEAL CALVES.—A couple of stormy days kept back near points and the market is temporarily high. The scarcity of primes has given more sale to State and grassers.

Live mixes, N. J. and Bucks Co., fed 6¼@7½c., State choice, 7c.; fair to prime 5½@6¾c.; poor, 4@5c.; Mt Holly, 180 to 240 lbs., 6½@7c.; do., 250 to 350 lbs., 6@6¼c.; buttermilk, 2½@3c.; grassers 2½@2¾c.

Entered at the Post-office at New York City, N. Y., as second-class mail matter.

NEW MUSIC BOOKS

The Anthem Harp.

($1.25.) By DR. W. O. PERKINS.

A new book intended as a successor for "Perkins' Anthem Book," published some years since and which was a decided success. The new book contains music perfectly within the reach of common choirs, and is destined to have a great sale.

DITSON & CO. also call attention to their three books for SINGING CLASSES; recently published, already very popular, and worthy of universal adoption.

The Temple.

($1.00.) By DR. W. O. PERKINS.

The Voice of Worship.

($1.00.) By L. O. EMERSON.

Johnson's Method for Singing Classes.

(60 cents.) By A. N. JOHNSON.

The Temple contains an excellent Singing School Course, and a large number of Glees, Songs, Sacred Tunes and Anthems for practice and for use in classes. L. O. Emerson's Voice of Worship has exactly the same end in view as the other, but has a different method, and entirely different music. Johnson's Method is for those who wish a low-priced book; is admirably simple and clear, has plenty of music, and has a thorough course in Note Reading.

Reading for the Young.

IN MY GARDEN.

My garden is all planted o'er,
The borders have been freshly dug,
The green shoots are a pleasure for
The slug.

The fruit is forming on the stalk,
But woe is me! No care avails
When on my pear-trees proudly walk
The snails.

The mignonette and fragrant pea
Throw in the air their tender germs,
But wriggling round their roots I see
The worms.

My cherished rose-tree! Horror! That's
A sight that saddens sorry eyes;
Covered its leaves with tiny gnats
And flies.

Of slug and snail and worm and gnats
In vain I am a ruthless killer,
Still there's that horrid cat, cat, cat-
Erpillar!

THE MARTIN.

MAUDE MEREDITH.

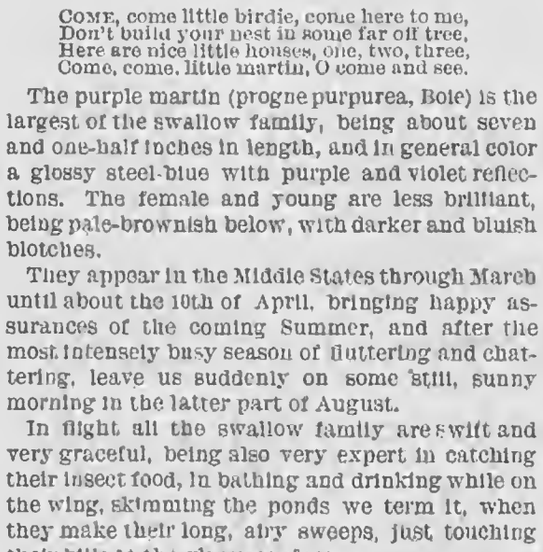
COME, come little birdie, come here to me,
Don't build your nest in some far off tree,
Here are nice little houses, one, two, three,
Come, come, little martin, O come and see.

The purple martin (progne purpurea, Boie) is the largest of the swallow family, being about seven and one-half inches in length, and in general color a glossy steel-blue with purple and violet reflections. The female and young are less brilliant, being pale-brownish below, with darker and bluish blotches.

They appear in the Middle States through March until about the 10th of April, bringing happy assurances of the coming Summer, and after the most intensely busy season of fluttering and chattering, leave us suddenly on some still, sunny morning in the latter part of August.

In flight all the swallow family are swift and very graceful, being also very expert in catching their insect food, in bathing and drinking while on the wing, skimming the ponds we term it, when they make their long, airy sweeps, just touching their bills to the glassy surface.

These little fellows, though so harmless and friendly, are yet no cowards, as many a feathered enemy has found to their discomfort, for they attack crows and hawks, which from their superior flight they are enabled to drive away, and are thus valuable guardians of the poultry-yard. Cats and dogs, in fact any marauders of the farm yards, are sure of a rather warm reception if the martin first holds possession. For this reason, and from their friendly social nature, they are great favorites, and are provided with little elevated houses, or less pretentious boxes, near by dwellings, and



PURPLE MARTIN.—FIG. 305.

their company assiduously cultivated by man. They become much attached to their Summer homes, and return to the same place year after year, and when the little folks with rosy cheeks and sparkling eyes rush in crying, "Oh, the martins have come! the martins have come!" how even we, children of an older growth, grow happy and unconsciously date our Summer from that time. Though sometimes a cold storm will send the little birds shivering into their houses, and prove true the old adage "It takes more than one swallow to make a Summer."

In absence of houses, the martins build in any crevice or hole in a tree. The nest is made of leaves, twigs and grasses, feathers and other soft linings, and usually contains from four to six pure white eggs. Two broods are generally reared in a season and many families will live in perfect harmony in one little tenement. Their food consists of flies, wasps and beetles, though by some instinct hard to determine, they seldom touch a honey-bee.

The swallow family is composed of quite a number of cousins closely resembling each other, but differing in their nesting habits. 1, the barn or eaves swallow, building in barns or under the eaves of old houses or barns, its house made solely of mud and plastered to the timbers. 2, the house or chimney swallow, building its nest of loose twigs in any unoccupied chimney, and the Sand Martin, or Bank Swallow, who drives his circular shafts into the sides of the rocky banks, or any dry, sandy river shore. I will tell you all the peculiarities of these interesting birds at some other time, but now that the busy days of Summer are over in the bird kingdom, and almost over for the busy little boys on the farms, let me suggest that all our RURAL boys who have never made martin houses, use some of the long Winter evenings that are coming by and by, to make at least a couple of houses ready for another Spring. Almost any box will do, an empty starch-box or any of small size, and here a boy can display his taste and ingenuity. A roof can be easily made of two bits of board, the little arch or door carefully cut in one or both ends, and all painted with imitation windows or porches, in any color or shade that fancy or a bit of paint left in the paint-pot when the painter has finished may suggest. The box should be fastened in a tree or some upright post will do as support to fasten the birdhouse upon, but a straight fine pole or little tree is better, peeled of its bark, and after nailing the house to the smaller end, set the larger end firmly in the ground, for the houses must not be endangered by Summer storms and wind. Plant woodbine or grape vines—any tall-growing vine that will twine about it, wreathing the support in greenness, while at the top Mr. and Mrs. Martin go in and out of their fairy house, but infinitely more free from intrusion than was Mr. and Mrs. Giant at the top of "Jack's" famous "bean."

"When the swallows homeward fly,
When the roses scattered lie,
When from neither hill nor vale
Chaunts the merry nightingale,"

then we fully realize how much pleasure the little feathered songsters added to our Summer days.

THE WATER-PUPPY.

THIS is not a water dog, there are several things which are given the name of water dog. A sailor is often so called from his sea going habits, but he is more often called a sea-dog. A small floating cloud supposed to indicate rain is called a water-dog, not the two bright luminous spots sometimes seen in the morning on either side of the sun, those are called sun-dogs. The Shark is also called sea-dog from its fierce nature—but sharks are also called sea-kittens, sea-foxes, &c.

The seal is also called a sea-dog from its barking like a dog, but it is also called a sea-bear, sea-lion, &c. A water dog is also a species of the common dog which is useful to hunters and loves the water. The water-puppy is also sometimes called a water-dog but its proper name is water-puppy. It has not heretofore been very fully described nor have its habits been very well known. It is supposed to be a very poisonous inhabitant of the water and most people would fight shy of it.

At the meeting of the Natural History Department of the Association for the advancement of Science at Boston, Dr. P. R. Hoy, of Racine, Wis., gave a very minute description of the water-puppy, its structure, habits and manner of life. He said that Physiologically it is a fish, with legs instead of fins. It inhabits the large rivers and lakes of the north, and is especially numerous in Lake Michigan. It seeks deep water and swims with much velocity. It takes the baited hook, and dire is the consternation of the boy who hooks the poisonous fish with legs. In life the water-puppy is a beautiful object, with its long, scarlet, plumose gills waving continually. When confined in an insufficient quantity of water, it will rise to the surface, take a mouthful of air, and bubble it out through the gill openings, thus getting mechanically a supply of oxygen, precisely as do certain fishes in like circumstances. Dr. Hoy then gave a more particular account of its structural peculiarities, and some interesting experiments of his own on points which distinguish the menobranc from the fish race generally and from other amphibians, but we are unable to obtain his complete account until the publication of the proceedings of the association.

THE BOBOLINK'S NEST.

DEAR UNCLE MARK:—I am a city girl staying with Uncle Nathan on the farm this Summer. One day we all went away on the hill after raspberries. There was Auntie Min and mamma and Gene and Jo and I. We rode up on the great hay-wagon, and Uncle Sidney said the load up to the meadow was a great deal nicer than the one down to the barn would be. He gave us a drink of water out of Jo's little tin cup from the nice cold spring, and when we came to the meadow fence, then he helped us off the wagon and we hurried away to the raspberry bushes. Some of the bushes grew very high and swung the round, red berries just out of reach, above our heads; but there were berries enough lower down, so we could fill our pails. Then we sat down on soft mossy knolls and strung berries on long stems of herdsgrass until our fingers grew as red with stains as the berries themselves.

At last auntie and mamma came along with their great pails full of berries and sat down by us to rest when mamma put her hands behind her head and laid down on the moss "To watch the slow, white clouds in June's blue sky," she said. Wasn't she funny, for it was the middle of July. By-and-bye she said "It rains! A drop just fell on my nose," and we all laughed, and did not think it rained at all, but in a few minutes whole armies of big drops came after us, until we started and ran as fast as we could out of the pasture through a wheat field and into the meadows toward shelter.

I was hurrying so fast and trying to keep my berries from spilling when what do you think? Out of the long grass flew a little brown bird, and there we found a bobolink's nest with three speckled eggs in it. Mamma said in all her life she never saw one before.

There is a little round place dug in the smooth ground, and the nest, so nice and round and smooth, fixed in. Mamma says if you like my stories I may tell you all the pretty things I have seen this Summer on uncle's farm.

Iowa. GEORGIA G. SMITH.

A FUNNY CAT.

In a basement news room in Nassau street, N. Y., the keeper has a large fat black cat, apparently some seven or eight years old, which shows not a little power of reasoning. The writer stepped down into the room one day, and stood talking with the proprietor, but without taking any notice of the cat for some time, although it came rubbing up against him, and finally to attract his attention jumped upon the counter before him, and rubbed against his hands. The writer neglected to pet the animal, and after he was done his conversation turned to the steps to go out, as he did so the cat leaped from the counter with almost lighting quickness, caught the departing visitor, by the leg, and imprinted its claws deeply and sharply into the flesh, and darted away to the further extremity of the store to a hiding place, all so quickly that the writer had hardly time to comprehend what was going on. The owner of the shop said that the cat seemed to think that it was as much entitled to notice as anybody, and took that way of showing its displeasure when not noticed.

LETTERS FROM THE COUSINS.

DEAR UNCLE AND COUSINS:—I am almost ashamed to write as I have had such a failure this summer in my garden work. The phloxes and petunias came up nicely but were cut off before the time for transplanting came. The okra was forgotten. The pinks grew nicely until ready to blossom when the chickens nipped the buds. The mignonette is growing finely. Among mamma's flowers, the asters, gladioli, pansies and geraniums are blossoming nicely. It has been so terribly hot that the earth has been parched until lately, when we were blessed with rain. I am going to sow pansy seed in a few days for plants early in the Spring. I am very sorry I have so poor a report to make, but I think I shall have something in my next which will prove that I am not an entirely idle member of the Club.

Yours sincerely, MINNIE S. WHITE.
Erie Co., N. Y.

DEAR UNCLE MARK AND RURAL COUSINS:—This is my first attempt to write to Uncle Mark. Our RURAL seeds did not grow very nicely. There were no more than half of them came up. This is the first year Pa has taken the RURAL we all like it very much. We have got lots of peaches. I wish Uncle Mark and all of the RURAL cousins could be with me and help eat them. We think some of them will go to waste. Those that are ripe now are the early Crawfords. I hope if Uncle Mark has any seeds for the cousins next spring he will remember me with the rest of them. Pa's oats that were sent with the RURAL grew so tall that one night the wind blew them down. Our Cow peas and Golden Mangels are very nice. I am 12 years old. BERTHA M. HALE.
Kent Co., Michigan.

The Puzzler.

HIDDEN BUILDINGS

1. Why, Kate, your dress is all mildewed.
2. When I had put on my cap I told him I was ready.
3. Beware of the bar, Nathaniel.
4. Three cheers to reach the train in time.
5. "I shan't, you wicked girl," she said.

☞ Answer in two weeks.

A DROP LETTER PUZZLE.

A.. I. .o. .o..'..a. ..i..e..

Fill with consonants and form an old and well-known saying. LITTLE ONE.

☞ Answer in two weeks.

CROSSWORD ENIGMA.

My first is in plantain, but not in quince.
My second is in cantaloupe, but not in mince.
My third is in muskmelon, but not in pumpkin.
My fourth is in winter-green, but not in raisin.
My fifth is in mango, but not in cassava.
My sixth is in apricot, but not in guava.
My seventh is in sapadilla, but not in dewberry.
My eighth is in damson, but not in strawberry.
My ninth is in persimmon, but not in papaw.
My tenth is in bread-fruit, but not in haw.
My eleventh is in nannieberry, but not in banana.
My whole is a delicious fruit. LITTLE ONE.

☞ Answer in two weeks.

TENNYSONIAN ENIGMA.

31 LETTERS.

"To their 17, 4, 21, 2, 19 under the hill."
"To love once and 10, 30, 23, 13, 21, 6, 11."
"The bounds of 29, 11, 6, 6, 15, 9, 24 wider yet."
"Two little 1, 28, 14, 26, 7 that meet."
"He turned and 5, 12, 7, 7, 31, 15 her where she stood."
"And 20, 8, 13, 26 loved the queen."
"Sainted Juliet, dearest 19, 25, 3, 27."
"A legend of good 16, 18, 3, 22, 19."

The whole is a line from Elaine which contains much truth. MARY E. BIXBY.

A DIAMOND PUZZLE.

1, A letter; 2, a bud; 3, a carniverous animal; 4, origination; 5, intervening; 6, a knot of hair; 7, a letter. GUS.

☞ Answer in two weeks.

LITERARY ENIGMA:—Where Autumn, like a faint old man, sits down by the wayside a-weary.

HIDDEN CRIMES:—1, bigamy; 2, arson; 3, infanticide; 4, robbery; 5, matricide; 6, burglary; 7, murder; 8, manslaughter; 9, rape; 10, fratricide; 11, forgery; 12, assault and battery; 13, larceny; 14, theft; 15, embezzlement.

Sabbath Reading.

PASSING AWAY.

PASSING away, so whispers the wind,
As it treads in its trackless course;
And passing away, doth the bright rill say,
As it leaps from its crystal source.
All passing away on the stream of time,
To oblivion's vale in a far-off clime.
Matter and man, we make no delay,
To eternity's gulf we are passing away.

Passing away, mark the wrinkled brow,
And the head with the silvery hair,
And the furrowed cheeks, how they plainly speak
That they're leaving a world of care.
Yes, passing away, even beauty's flower,
Is fading fast 'neath the spoiler's power,
And fair and frail, to their bed of clay,
Adown in the tomb are passing away.

Passing away, shrieks the ocean wave,
As it breaks on the beaten shore;
And the tortured tide is left to chide
The cliffs with a hollow roar.
Aye, passing away, both from castle and cot,
The places which know us will soon know us not;
Whether peasant or prince nature's last debt to pay
At the fiat of God we are passing away.

Passing away, even Time himself,
Bends under his load of years,
His limbs are frail and his cheeks grow pale
With the furrows of sorrowing tears.
With his broken scythe, with a silent tread,
He is passing on to the home of the dead;
With a bending form and with locks grown gray
Even Time himself is passing away.

Passing away, how swiftly they go!
Those scenes of our youth once dear;
Those friends we loved are by death removed,
And the world waketh strange and drear!
And the hopes of our youth, see, they all depart,
And the chords of love round the human heart;
E'en the soul groweth tired of its cot of clay,
And the essence immortal would fain pass away.

Passing away, all but God's bright throne,
And his servants, home above,
And His grace divine and the boundless mine
Of His eternal love.
And His will to save, through a Saviour's blood,
The child of faith who hath washed in the flood;
Even earth to its frame-work doth all decay,
But God and His love will ne'er pass away.

HOLD ON, HOLD IN, HOLD OUT.

HOLD on, my heart in thy believing;
The steadfast only win the crown;
He who, when stormy winds are heaving,
Parts with his anchor, shall go down.
But he whom Jesus holds through all
Shall stand, though heaven and earth shall fall.

Hold in thy murmurs, heaven arraigning;
The patient see God's loving face;
Who bear their burdens uncomplaining,
'Tis they that win the Father's grace.
He wounds himself who braves the rod,
And sets himself to fight with God.

Hold out! there comes an end to sorrow;
Hope from the dust shall conquering rise.
The storm foretells a sunnier morrow:
The cross points on to paradise.
The Father reigneth: cease all doubt;
Hold on, my heart, hold in, hold out.

"SEE," said Luther one evening when money to supply his wants was scarce, "see, that little bird has chosen its shelter, and is about to go to sleep in tranquility. It has no disquiet, neither does it wonder where it shall rest to-morrow night, but it sits in peace on its slender branch, leaving God to provide for it."

There were strange soul-depths, restless, vast, and broad,
Unfathomed as the sea.
An infinite craving for some infinite stilling;
But now thy perfect love is infinite filling.
Lord Jesus Christ, my Lord, my God,
Thou, Thou art enough for me!
—Frances Ridley Havergal.

GOD'S LOVE.—God so loveth us that He would make all things channels to us and messengers of His love. Do for His sake deeds of love, and He will give thee His love. Still thyself, thy own cares, thy own thoughts for Him, and He will give thee Himself. Ask for Himself, and he will take thee into Himself. Truly, a secret, hidden thing is the love of God, known only to them who seek it, and to them also secret, for what man can have of it here is how slight a foretaste of that endless ocean of His love!—Zion's Herald.

GRIEF should be
Like joy,—majestic, equable, sedate,
Confirming, cleansing, raising, making free,
Strong to consume small troubles, to command
Great thoughts, grave thoughts, thoughts lasting to the end.—Aubrey de Vere.

OUR hope is not hung on such an untwisted thread as "I imagine so," or "it is likely;" but the strong cable of our fastened anchor is the promise and oath of Him who is eternal verity. Our salvation is fastened with God's own hand and Christ's own strength to the stronghold of God's unchanging nature and truthfulness.

"WHAT is eternity?" was a question once asked at the Deaf and Dumb Institution at Paris, and this beautiful and striking answer was given by one of the pupils: "The lifetime of the Almighty."

THE good are better made by ill,
As odors crushed are sweeter still.

MEN will never know us by our faith, for that is within us; they know us by our works which are visible to them.

WORK to-day, for you know not how much you will be hindered to-morrow.

PERSONAL ITEMS.

"How under heavens am I to get along now?" was the regretful remark of shiftless Hank Munroe of Lebanon, Mo., after he had, in a moment of anger, killed the wife who had long supported him.

General Torbert, lost on the Vera Cruz, leaves a widow, but no children. His estates near Milford, Del., are valued at $200,000. He is reported to have acted bravely and cheerfully during the last hours before the wreck.

Miss Flora Sharon, daughter of Senator Sharon, is betrothed to Sir Thomas Hesketh, a wealthy Englishman, who, in the course of a tour round the world in his steam yacht, has been making a stop at San Francisco.

Professor Alexander Graham Bell has received the Volta prize of the French Academy of $10,000 for the invention of the telephone, as "the best application of electricity." He values the prize chiefly, he says, as settling the question of the real inventor.

Mr. Gladstone is going to Madeira, and a sea voyage will, it is thought, thoroughly restore him. He is said to be at present troubled about the will of his late sister, Helen Gladstone. It has mysteriously disappeared, and her executors have offered a reward of $500 for its discovery.

Henry Labouchere, editor and proprietor of the London Times, who has lately become a prominent advocate of farmers' rights in Parliament, is described as a scholar of extensive and well-digested reading, a traveled linguist, a diplomatist of nearly twenty years' training, a shrewd financier, a brilliant conversationalist, a ready, incisive public speaker, a man of wit, a man of sense, and a man of business.

It has been suggested that Mr. Gladstone ought to succeed the late Lord Stratford de Redclyffe as Knight of the Garter, although the honor is rarely conferred upon a commoner. Admiral Montague, whose ship brought Charles II. back to England, was created a Knight of the Garter before he received the Earldom of Sandwich, as was Monk, at the same time, before he was known as Duke of Albemarle. According to Pepys, the only commoner on whom the honor had been conferred previously was George Villiers, first Duke of Buckingham, who was enrolled when only a plain knight, in 1616. But Sir Robert Walpole received a garter in 1725; and one was offered to the younger Pitt by George III., and on his declining it, given to his brother, Lord Chatham.

[Chicago Inter-Ocean.]

Perils of the Deep.

The world-renowned swimmer, Captain Paul Boynton, in an interview with a newspaper correspondent at the seashore, related the following incidents in his experience:

Reporter.—Captain Boynton, you must have seen a large part of the world?"

Captain Boynton.—"Yes sir, by the aid of my Rubber Life Saving Dress, I have traveled over 10,000 miles on the rivers of America and Europe; have also been presented to the crowned heads of England, France, Germany, Austria, Belgium, Italy, Holland, Spain and Portugal, and have in my possession forty-two medals and decorations; I have three times received the order of knighthood, and been elected honorary member of committees, clubs, orders and societies."

Reporter.—"Were your various trips accompanied by much danger?"

Capt. Boynton.—That depends upon what you may call dangerous. During my trip down the river Tagus in Spain, I had to "Shoot" one hundred and two waterfalls, the highest being about eighty-five feet, and innumerable rapids. Crossing the Straits of Messina, I had three ribs broken in a fight with sharks; and coming down the Somane, a river in France, I received a charge of shot from an excited and startled huntsman. Although all this was not very pleasant, and might be termed dangerous, I fear nothing more on my trip than intense cold; for, as long as my limbs are free and easy, and not cramped or benumbed, I am all right. Of late I carry a stock of St. Jacobs Oil in my little boat,—(the captain calls it "Baby Mine," and has stored therein signal rockets, thermometer, compass, provisions, etc.)—and I have had but little trouble. Before starting out I rub myself thoroughly with the article, and its action on the muscles is wonderful. From constant exposure I am somewhat subject to rheumatic pains, and nothing would ever benefit me, until I got hold of this Great German Remedy. Why, on my travels I have met people who had been suffering with rheumatism for years; by my advice they tried the Oil, and it cured them. I would sooner do without food for days than without this remedy for one hour. In fact I would not attempt a trip without it."

The Captain became very enthusiastic on the subject of St. Jacobs Oil and we left him citing instances of the curative qualities of the Great German Remedy to a party around him.

New Publications.

The Literary Revolution.

In January, 1879, **The Literary Revolution** was inaugurated by the publication of one small volume. In September, 1880, its list, published and in preparation, comprises over 120 volumes of standard books. It gives employment to about 500 hands, is actually delivering to purchasers over three tons of books a day, or over 1,000 tons a year, and is so far from able to fill all orders that additional buildings have just been leased, machinery purchased, and other steps necessary taken to double the present product within the next sixty days. To meet the popular demand for the coming twelve months at least 2,000,000 and probably 3,000,000 volumes will be required. The almost wonderful success which the Revolution has achieved is doubtless to be attributed to its leading principles, which are: I. Publish only books of real merit. II. What is worth reading is worth preserving—all books are neatly and strongly bound. III. Work on the basis of the present cost of making books, which is very much less than it was a few years ago. IV. Books have commonly been considered luxuries; in a free republic they ought to be considered necessities, and the masses will buy good books by the million if prices are placed within reach. V. To make $1.00 and a friend is better than to make $5.00 only, and 1000 books sold at a profit of $1.00 each gives a profit of only $1,000, while 1,000,000 books sold at a profit of one cent each gives a profit of $10,000, and it is more pleasure as well as more profit to sell the million. The most important publication thus far undertaken—indeed the most important work ever published in this country—a work that every intelligent person wants in his library, is the **Library of Universal Knowledge.** It is a verbatim reprint of the last London edition of Chambers's Encyclopædia, with copious additions by American editors, about 15,000 topics being added to the original work. It will contain, complete, about 10 per cent more than Appleton's and 20 per cent more than Johnson's Cyclopædia, though costing but a fraction of the price of either. The publication of a large type edition of the Library of Universal Knowledge is just begun, vol. I. being issued September 1. Two or more volumes will be issued each month till the whole is completed in 15 vols. octavo of nearly 1,000 pages each. The price of the large type edition in cloth binding is $1.00 per volume; bound in half Russia, gilt top, price $1.50 per volume. According to our usual custom, special reduction in price is made to early purchasers, and during the month of September only orders for volumes I., II., or III., either or all, will be received at the nominal price of 65 cents per volume for the cloth, 95 cents per volume for the half Russia, gilt top. As a portion of the Library of Universal Knowledge, the Chambers's Encyclopædia is also published separately, complete in 15 volumes of clear nonpareil type, and sold, bound in cloth, for the nominal price of $7.50, or in half Russia, gilt top, for $15.00. Of this style 12 vols. have already been issued, vol. 13 will be ready September 10, and Vols. 14 and 15 a few days thereafter. On this also special terms are given to early purchasers, the price being to those whose orders are received during September $6.75 for the set complete in cloth, $13.50 for the half Russia gilt top. The volumes already issued will be sent at once by express, and the remainder when completed in October. The Revolution is always undertaking new enterprises and accomplishing new victories. During September in Religion we expect to complete Young's "Analytical Concordance to the Bible," the great "Webster Unabridged" edition of of Smith's Bible Dictionary. In Biography, two volumes added to our Acme Library of Biography contain 10 vols. selected from the famous English Men of Letters series, at little more than one tenth the cost heretofore. In Poetry we shall soon have the Iliad and the Odyssey of Homer, translated by Pope, and a large type edition of Shakespeare. In History a cheap edition of the celebrated Froissart's Chronicles, with over 120 illustrations. In Fiction, Scott's "Ivanhoe" and Bulwer's "Last Days of Pompeii." In Juvenile, "Karl in Queerland," profusely illustrated. The cost of making books diminishes in large degree as their number is multiplied. Many of our books are selling in so much larger quantities than we anticipated that we find it in our power to considerably reduce their prices, and we do it with a great deal of pleasure. Among those so reduced are the histories of Macaulay and Gibbon, Taine, Rollin, Josephus, Modern Classics, Milton, Virgil, Dante, Koran, Bunyan, Crusoe, and several others.

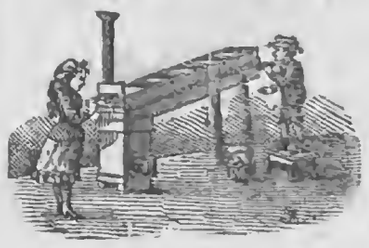
THE AMERICAN FRUIT DRIER.



Cheap! Practical! Portable!

Correct Principles, Correctly Applied. Illustrated Catalogue giving much valuable information mailed *free*.

Address, American Fruit Drier Co., Chambersburg, Pa., U. S. A.

$1000 REWARD

FOR ANY WASHING MACHINE that will wash cleaner, quicker, with less labor and wear and tear of clothes than the ROBBINS FAMILY WASHER AND BLEACHER, patented Oct. 3, 1871. No rubbing required. It is the best in the world, and cannot get out of order. GOOD AGENTS WANTED, BOTH MALE AND FEMALE. Send for descriptive circulars and testimonials. Price $3.50 delivered at Railway Express office east of the Mississippi and Missouri Rivers, also in Kansas and Nebraska.

BISSELL MANUFACTURING CO.,
50 Barclay St., New York.

Farm Grist Mills

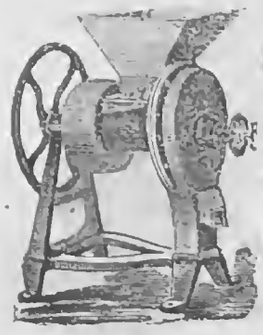
And Corn Shellers

Over 25,000 Now in Use.

Every machine is guaranteed to give satisfaction or no pay. Price of Mill, $30. Shellers, $5. Every farmer should have them. Send for Illustrated Circulars and terms to agents. Address,

LIVINGSTON & CO., Pittsburgh, Pa.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y.



THE VICTORY CORN MILL.

The only Mill that is a complete success in grinding corn and cob together. We defy competition on this kind of grinding. It also grinds shelled corn and all other kinds of grain, coarse or fine, as desired. Capacity, 10 to 20 bushels per hour. Self-sharpening plates, and warranted in every respect. Address

THOMAS ROBERTS,
Springfield, Ohio.

Humorous.

WHY is the world like a piano? Because it is full of sharps and flats.

"ARE you asleep, dearest?" "Yes, mamma, and the doctor particularly said that I needn't be waked up to take my medicine." (*snores.*) —Punch.

A YOUNG man boasted that he had a well-stored mind: whereupon a young lady murmured: "What a pity we can't find out where he stored it?"

THE pastor of a church is reported to have prayed the other Sunday for the absent members who were "prostrate on beds of sickness and chairs of wellness."

THE Emperor of China has 400,000,000 subjects, and not one of them is named John Smith, but as every third man of them is called Hop Sing it is just as bad.

SOME wicked Yankee says that he has invented a new telegraph. He proposes to place a line of women fifty steps apart, and commit the news to the first as a very profound secret.

DIVISION OF LABOR.—Aunt Mary: "Well, Tommy, shall I carry your bat and stumps for you?" Tommy—"No, aunty, tanks! *Me* tarry bat and 'tumps. 'Oo tarry *me*!"—Punch.

"Is that the second bell?" inquired a gentleman of a colored porter.—"No sah," answered the porter; "dat am de second ringin' ov de fust bell. We hab but one bell in dis establishmum."

LITTLE Johnny went fishing without consulting his parents. Next morning a neighbor's boy met him and asked: "Did you catch anything, yesterday?" "Not till I got home," was the rather sad response.

SITTING Bull's son consented to have his photograph taken if he might be permitted to hold his revolver ready to shoot the artist if the camera should go off, and the photographer took the chances and got a fine cabinet picture of the frightened brave.

"Hi! where did you get them trousers?" asked an Irishman of a man who happened to be passing with a pair of remarkably short trousers on. "I got them where they grew," was the indignant reply. "Then, by my conscience," said Pat, "you've pulled them a year too soon!"

"I CAN'T tell for the life of me," said an old farmer at the White Mountains to a party of city visitors, the other day, "what you fellers see up here to draw ye. For my part, these old-fired hills have been the worst thing we've had to contend with. Still, it's all right if ye like it; we're glad to see ye; only it's mighty funny."

SUNDAY AT THE SEASIDE.

Sis.—"Aren't you coming to church with us this morning, Herbert?"

Herbert.—"No, an excursion train is just in, so I shall stroll about on the beach and look at the breakers—the Sabbath breakers, I mean?"

After Uselessly Battling

With rheumatism for years, a course of Hostetter's Stomach Bitters has afforded the desired relief to many, who, grateful for the relief obtained, have borne emphatic evidence to the excellence of this grand medicinal staple, which eliminates from the blood the seeds of the agonizing disease, and neutralizes their further development. The genial glow it diffuses through the system, and its invigorating action also tend to counteract the effect of exposure in damp or otherwise inclement weather, and render it peculiarly serviceable to those troubled with an hereditary tendency to rheumatism, that trifling causes often aggravate into a serious attack of the malady, which is perhaps the most inveterate one against which medical skill is exerted. The medicine insures complete digestion and assimilation, healthfully stimulates the kidneys and liver, and promotes regular action of the bowels. In short, possesses remedial and preventive qualities constituting it a most valuable household remedy.

New and Rare Winter Flowering Plants.—New Fruits, Dutch Bulbs, &c.

New Pears, new Peaches, new Cherries, new Grapes, new Strawberries, &c., with a large stock of all kinds of Fruit trees, shrubs, &c.

DUTCH BULBS.—Large importations direct from the leading growers in Holland. First quality Bulbs, Beautiful Hot-house plants, Orchids, Dracænas, Crotons, &c. Winter flowering plants, Roses, &c., well grown. Cheap by the single plant or doz., by mail or express. Catalogues mailed to applicants.

THE RURAL NEW-YORKER

Ralph Evans

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 39. WHOLE No. 1600. | NEW YORK, SEPT. 25, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Dairy Husbandry.

JERSEY QUEEN OF BARNET, Vt.

T. H. HOSKINS, M. D.

The Fairbanks family, of St. Johnsbury, Vermont, famous the world over as scale makers, are also farmers. The "arms" of Vermont represent a pine tree, three sheaves of wheat and a cow. The pine trees vanished from her hills long ago. Wheat, which was once her staple crop, has ceased to be so; but the cow remains. Vermont is essentially a dairy State, and especially a butter State. The abundant sweet grasses of her hills, and the equally abundant cool springs, as well as the accessibility of the best markets for good butter in the rich cities of southern New England, all combine to turn the industry of Vermont farmers into that channel. It ought to be added that the character of Vermont farmers' wives, their intelligence and their industrious, careful habits, give the State an advantage in a business where such qualities tell in the quality and marketable value of the product. Almost every family in Vermont keeps cows. Many of her village people, manufacturers, merchants and professional men, own farms and run dairies. Such millionaire citizens as the Fairbankses and President Smith of the Central Vermont Railroad are no exception. The former run some 500 acres and the latter over 1,000 acres, the marketable product in both cases being mainly butter. Most of our lawyers who seek for political preferment at the hands of the people run dairy farms as a make-weight in popular favor, and to "head off" any practical farmer who may aspire, on that ground, to the suffrages of the people. In short, butter is the "boss" interest among the Green Mountains.

Naturally, the peculiar merit of the Jersey breed of cattle, its capacity for the production of choice butter, early attracted the notice of Vermonters, and men of means began to purchase and farm herds of these cattle as much as 20 years ago. The Fairbankses, having abundant wealth and business houses located both in England and France, began to collect a choice herd among the first, and the Fairbanks' Jerseys have long been held in high repute, especially in the upper Connecticut Valley. The Caledonia County farmers (largely of Scotch ancestry, but Yankees of the Yankees in all the best Yankee characteristics, nevertheless,) have availed themselves of the advantage offered in the existence of this herd amongst them, and the cattle of that region (and to a less extent of all northeastern Vermont) nearly all have a strong tincture of Jersey blood. Many herds of pure-bred cows, numbering from five to thirty, exist and form centers in the several towns for the dissemination of grade stock round about. As a consequence this part of the State is favorably known to all buyers of gilt-edged butter in Boston and elsewhere. Much attention is paid to putting up butter in fancy packages, one of which, the "Kenerson Butter Package," the invention of James R. Kenerson, of Peacham, Vermont, was illustrated and described in the RURAL some 18 months ago.

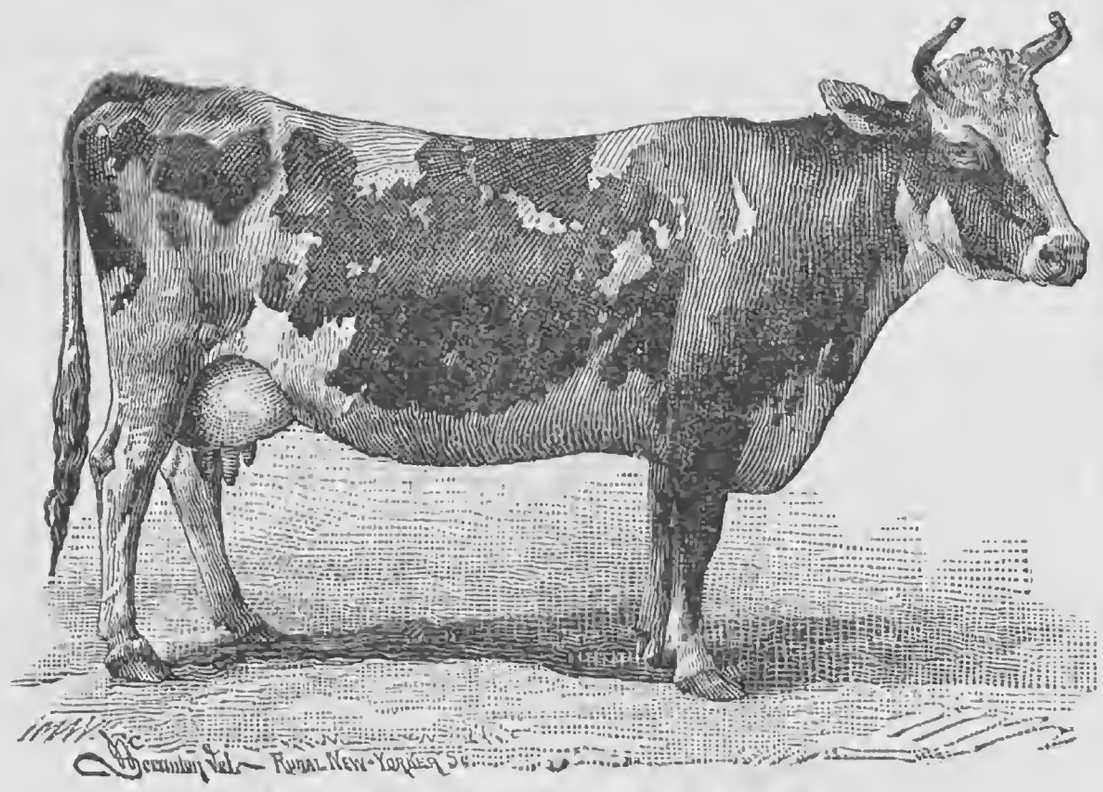
This Mr. Kenerson has a brother, Josiah S. Kenerson, of Barnet, who, though not the owner of a farm, is a great fancier of Jersey cattle. He has accumulated between 50 and 60 of them, which he has deposited singly, or by twos and threes, among the good farmers of his neighborhood. Whenever he sees a cow to his liking he buys her, and in this way he became possessed of the famous Jersey Queen, whose portrait from a photograph, graces the present issue of the RURAL. She is of the "Fairbanks stock," having been dropped on the Fairbanks farm January 2, 1874. She was sold, while a heifer, to Asa Hoyt, of Peacham. Her first calf (a heifer) was dropped June 26, 1876, her second and third (both bulls) in 1877 and 1879. While in Mr. Hoyt's possession she revealed remarkable qualities as a butter maker. From March 15, 1879 to the same date in 1880, according to the sworn testimony of her owner, Jersey Queen produced 676 pounds of butter. During the same time 468 quarts of her unskimmed milk were otherwise disposed of. The tests made from time to time showed that from six to seven quarts of her milk made a pound of butter.

This would place her entire butter yield for the year at 748 pounds, a product which fully entitles her to the title of "Jersey Queen," and also reveals the fact that an American (and mainly Vermont) lineage of nearly or quite 20 years has in no wise deteriorated the dairy quality of these Jersey cattle. As a fact the Vermont Jerseys in careful hands have increased in size, beauty and productiveness over their imported ancestry, and no better cows or bulls of this breed exist on the island of Jersey to-day than can be found in many herds owned in Vermont, descended from some of the earliest importations. These Jerseys, by their merits alone, fairly tested alongside of the Devons, the Short-horns, the Ayrshires and the Dutch (all of which are well known among Vermont dairymen), have so taken the lead that almost no demand now exists here for any other stock for the butter dairy. This fact has been repeatedly, and will be again, attested at the fair of our own State Agricultural Society, and at every local fair throughout the State. I make this statement without being in any way interested, but as an observer who has had as wide opportunities for observation as any resident of the State during the past 12 years; having attended in that time no less than 100 fairs, and visited many more than that number of our best dairy farms.

Last April Mr. Hoyt sold Jersey Queen to Mr. Kenerson, who placed her with S. K. Hazelton, of Barnet. During the week ending April 15, (her 13th month as a farrow cow) she gave 60 quarts of milk and made 12 pounds of butter. In her 15th month, ending June 15, she made 13 pounds, being then at pasture. She is now due to calve in February, 1881. Jersey Queen has never been fed over five pounds of grain daily, a mixture of meal and bran, and while at pasture she has had nothing but the grass.

I am and have long been personally acquainted with Mr. Kenerson and other parties above named, and am entirely satisfied of the correctness of the statements made in relation to the yield of butter as above given. I procured the photograph from which the engraving given herewith was made from Mr. Kenerson personally and sent it to the RURAL with this brief notice of the best butter cow in the world. I have had the best opportunities to know about this stock, having been for several years the editor of the Vermont Farmer while it was published at St. Johnsbury.

Orleans Co., Vt.



JERSEY QUEEN OF BARNET.—Fig. 306.

THE DAIRY COW—NO. 8.

HENRY STEWART.

How to Milk a Cow.

In milking the profit for all the labor and cost is secured. Cows are kept for producing milk, and a very important part of this business depends upon the milker. Good cows are spoiled by poor milkers. I have turned over to a hired man a cow that I had milked steadily and satisfactorily, and the milk has fallen off one-half in less than two weeks. The production of fifteen cows in my stable at one time decreased from an average of 336 pounds a day for the previous week to 340 pounds daily the next week, the reason being the employment of a poor, careless milker for one week only. He was a rough, brutal young man who abused the cows. The milk never fully came up again that season. The feed and feeder were the same. To save 50 cents a day by employing a boy in place of a valuable man, $2.70 a day were lost, the milk being sold at six cents a quart.

This is not at all an infrequent occurrence in dairies, and the reason of it may be easily explained. The cow is a nervous animal, and nervous excitement has always a serious effect upon the circulation. As the milk is secreted from the blood, anything that interferes with the circulation of the blood, interferes with the secretion of the milk. Besides, the udder is a most delicate organ, made up of sensitive membranes and exquisitely fine secretory glands, of which 300 placed side by side measure only one inch. These are made up of a number of round cells gathered together, and each cell is the end of a minute blood vessel, and the beginning of as minute a milk duct. Now, in drawing the milk, if it is not done gently, the fine structure of the udder is very easily irritated; if it is not done quickly and completely, the condition of these extremely delicate glands and ducts is affected more or less, and as they are very numerous a very small disturbance in each will have a very large aggregate result. So that a bad milker will soon dry up a good cow, and a good milker will be able not only to get all the milk the cow can make, but will be apt to help the cow to make more, by exercising the natural aptitude of the milk organs.

The process of milking is as follows: The milk secreted by the glands gradually fills the ducts from the smallest to the largest, the latter being situated at the lower part of the udder and having for their outlets the teats. The duct of the teat, when filled, has considerable capacity. When the teat is gently squeezed from the top to the bottom, the contents are forced out in a stream, and when the pressure is relieved the duct is instantly filled again, not only by the force of gravity, but also by the pressure of the distended membranes of the udder and by the atmospheric pressure as well, because when the teat is emptied and released from the squeezing of the milker's hand, the elastic tube takes its original form, and an air vacuum is formed in the passage, or would be, if the milk were kept back; this, however, rushes in and fills the space. The pressure should be from top to bottom of the teat, and should be made without dragging on it. To pull down the teat, as in stripping, so-called, between the fingers, is to be avoided. The teat should be taken in the hand from the top and squeezed with a firm, even motion. One may force the milk in a contrary direction, and from the teat to the udder by bad milking, and many cows are injured by this faulty action in careless or ignorant milkers. When the udder is completely filled, the pressure of the distended membrane is very great. Sometimes this pressure overcomes the elasticity of the annular or ring-like membrane which closes the opening of the teat, and the cow leaks milk.

If it were not for this outlet the cow would suffer; because when the distension of the udder is at a maximum, the pressure then affects the ultimate gland cells which are highly nervous, and causes pain; it further affects the circulatory apparatus, and causes engorgement; the blood in these fine vessels cannot then unload its burden of milk, and this is returned into the circulation, with the effect to load the blood with abnormal, and therefore diseased matter. From this it will be readily seen that some cows should be relieved of their milk more than once in twelve hours, and that once in eight hours would be better and safer, and would be more productive of milk; and further, it will be seen how much mischief may result from leaving in the udder a portion of the milk not drawn off, or of drawing it in an improper manner. The udder should be completely emptied of milk at each milking. The cow should not be disturbed during milking, and no person but the milker should be present.

The best time for milking is either immediately before or after feeding. To milk while feeding is troublesome and annoying. No singing or droning should be permitted, but to speak to the cow in a gentle, petting manner will not be objectionable. Constant watch should be kept against any movement of the cow's leg or foot which might upset the pail, and if such should happen accidentally, the cow should not be punished for it. Milking should be made a business; there should be no fuss, no noise; it should be done quietly and quickly. If a cow is vicious, she should be punished. A cut with a raw-hide, kept purposely, will be the most effective, and if but one blow is given, the cow will be disciplined and not enraged, as by repeated brutal beatings for revenge. I don't think there was ever a cow that was not improved by reasonable discipline in this way. Punishment for cause only, and that prompt, sharp, decisive and summary, is always needed some time or other, especially with some young cows, but a cow should never be *beaten* and NEVER kicked, or struck about the head or face.

Sometimes it is necessary to draw the milk artificially; this is done by means of a silver

tube, Fig. inserted into the udder. The tube is shown its exact size. It is oiled and carefully inserted in the teat, and in case of garget or wounded udder or teat, it is left in con-

MILKING TUBE.—FIG. 307.

tinually, so that the milk runs off as it is secreted. The slide regulates the depth to which the tube is inserted. But these tubes should only be used when thus required. They cannot safely be used for regular milking as a substitute for the hand. Efforts to introduce them for that purpose have been costly failures.

SHEBOYGAN CO., WIS., DAIRYING.

PROFESSOR G. E. MORROW.

Wisconsin dairy products have taken very high rank in the last few years. The quantity made, more especially of cheese, has rapidly increased, but not more rapidly than has been the improvement in reputation of these products. Not only have Wisconsin butter and cheese taken prizes at dairy fairs open to competition from all parts of the country, but the more decisive test of prices in the open markets shows that no State produces better cheese. This is owing to good natural facilities, good manufacture and to a more rigid adherence to the practice of making only full-cream cheese than has been customary in any other State in which equal quantities are made.

Sheboygan County, on the shore of Lake Michigan, from 40 to 60 miles north of Milwaukee, is one of the best dairy regions of the State. I have not accurate statistics at hand; but I believe there are between 80 and 90 cheese factories in the county—some of them receiving milk from adjoining counties. The cheese product last year was between 4,000,000 and 5 000,000 pounds. The number of milch cows owned last year was 18,129. The Winters are long and cold, but grass and grains grow very rapidly in Spring and the pastures are often more fresh and green in the Autumn than are those lying much further south. The soil varies from a sandy loam to heavy clay. Generally the surface is rolling and there are several good-sized streams and many small, clear, running brooks. Underdrainage would be of advantage in many places and a little has already been done in this work, although there are no tile factories in the county. Wheat has been a prominent crop in the county. This year it is almost a failure. Corn—mainly of the flint varieties—and oats do well. The meadows are mainly of Timothy and clover. The older pastures are mainly of Blue Grass—Poa pratensis—here called June Grass.

As a class, the cows are of "native" or common stock, of medium size. A fair number of full-blood and grade Ayrshires are to be found, and recently a few Holstein bulls have been brought to the county. While the Ayrshires have given good satisfaction to some of the owners, they have not become common. Hon. A. D. De Land is breeding his Ayrshire cows to a Holstein bull, using an Ayrshire bull on his common cows.

In a visit to this county this month, I found little that is remarkable in the management. I heard of no great yields of milk. As a rule, high feeding is not practiced. The majority of the cows have no other food during the best of the Summer except what they get in the pastures. The factories are generally comparatively small; I was informed that the one at Plymouth is now the largest in the State, receiving the milk of about 800 cows. A number of the factories are owned and managed by dairy farmers, who either make or superintend the making of the cheese, high-priced cheesemakers being the exception. The manufacturers receive from $1.25 to $1.50 per 100 pounds for making the cheese. Mr. De Land receives one-sixth of the selling price, guaranteeing a pound of cheese for ten pounds of milk.

Most of the cheese is Cheddar-shaped, averaging about 60 pounds. Some factories are making "flats" of about 35 pounds, and a few of the small "Young America" style. The latter are sold for one cent and the "flats" for one-half cent per pound above the price of the Cheddars. In an unusual degree, as it seems to me, there is uniformity of product and of price. The cheese is made firm and close-textured, and is now almost invariably sold as soon as fit for shipment; weekly sales of all cheese two weeks old are a common rule.

There is a successful Dairy Board of Trade, which has done much for the interest in the county. I was present at its well attended weekly reunion on August 6th. There were 1,800 boxes offered, and sales made at 11@11½c. for Cheddars. This price was fully as high as the New York quotations. It is worthy of note that this is probably the highest price at which July-made cheese has ever been sold in the country on a gold basis. The low prices of a part of last year were discouraging to some of the farmers, but they are now making as large profits as at any former time. This, with the failure of wheat this year, will tend to increase the attention to dairying.

The Hon. Hiram Smith, a well known dairyman, who has been President of the State and Northwestern Associations, and a successful competitor at many dairy fairs, is one of the comparatively few butter makers of the county. He has a herd of over 50 cows. He uses the Cooley creamers and Rectangular churn, and is selling his butter for the Summer months, to one of the leading Milwaukee hotels, at 25 cents per pound. Last year he sold 214 pounds of butter per cow. While this is not one of the "great yields," it represented a total yield of over $60 per cow. I found Mr. Smith's cows on good pasture, and receiving, twice a day, a feed of green clover, also of ground feed—bran and shorts. In a few days it was expected to give them green corn. Much is thought of this crop. Mr. Smith is practicing cutting it earlier each year, as he does with his meadows, and he now makes an absolute prohibition of pasturing the meadows. He has no difficulty in keeping a cow on rather less than four acres.

This county is one of the many illustrations of the good results from intelligent, persistent attention to dairying. There are obvious evidences of prosperity on the part of most farmers, and I much doubt if any grain-growing or even meat-growing counties have advanced more rapidly than has this.

I am now in Brown Co., in which but little attention has, as yet, been given to dairying. My friend, J. M. Smith, the well known market gardener, has a full-blood Ayrshire cow from the milk of which 371 pounds of butter were made in one year, the cow running on the commons, but having good feed in addition.

Green Bay, Wis., Aug. 14.

Goats for Churning.

Those persons who have tried them say that goats are the best of all animals for this purpose. Being natural climbers, the up-hill movement on the power used for driving the churn, does not tire them as it does other animals; in fact, they rather like the work as being special fun for them. Fewer or more goats can be put on to the tread power to operate it as a less or greater churning may require. As goats will subsist on coarser herbage than any other grazing animal, they are doubtless the most economical of all to use for churning; and those who have dairies of only a moderate size cannot do better than to use them for this purpose. If, in addition, they select them from milking breeds, they will be well repaid for their keep from this alone. Goat-milk cheese is a delicious article when properly made, and commands a high price in the European markets, being considered there a great luxury. Goats make handsome teams to draw children's wagons and sleighs, and are much sought after for this work. It will thus be seen that the goat can be utilized both profitably and pleasantly for quite a variety of purposes.

Sheep Husbandry.

SHEEP NOTES.

Green Fodder Crops would provide just now a most acceptable food for a flock of sheep. Every deterioration in the quality of the food may be found in the fiber of the wool. Every pinching of the sheep's belly reduces the strength of the wool fibers immediately, and if the want of nutritious food is long continued, this weakening of the fiber becomes a most conspicuous sign of it. The care of the flock owner should be to provide a succession of green food for use when pastures become dry and hard. An acre or two of rape or tares on which to turn the flock would be most valuable now.

An Importation of Fine Sheep has been made by Mr. T. S. Cooper, of Pa., for exhibition at the international wool and sheep show at Philadelphia. These sheep are Oxfords and South-Downs. The Oxfords are the pick of the famous flocks of Mr. Treadwell and Mr. Street, and Lord Walsingham's South-Downs have been drawn upon for the remainder of Mr. Cooper's purchases. Although we are interested to see these show sheep so beautifully formed and gotten up, yet at the same time we regret to think that these *model* sheep will go the way of many former ones, and pass away without helping very much to make us independent of continuous importations. When will American breeders of these sheep be able to walk alone, as the Merino men, the Cotswold men and the Short-horn and Jersey men now do, and improve upon the imported stock? We have been importing South-Downs these many years, and if we are still to continue to import, it argues that South-Downs are no sheep for us. But we know better.

Stubble Shearing Sheep is one of the tricks of the exhibitor at fairs, made "the same with intent to deceive" the unwary observer and may-be purchaser, with appearances of full shoulders, square rumps, and fat buttocks. The fraud is forbidden, but if the judges are not well posted, the tricks of some breeders would deceive the very elect. So, too, the newly washed wool is artfully dressed with glycerine and yellow-ocher—as indeed we have seen fancy cows dressed, and have proved it by the application of the tongue to the skin, for a judge must not be too nice in such matters—and this dressing gives a soft feeling of the wool to the hand, and a luster and color to the eye, which are very taking. But let judges examine the fleece where the sheep appears too square and filled out, and compare the wool with that of other parts, and apply the tongue to the wool to detect the sweetness of the dressing, and bring all such tricksters to confusion.

The Sheep Business in the West is literally "booming." At a recent sale in Kentucky sheep that were offered at $10 a head at home without being sold, brought $46; which shows that they were not without honor except among their neighbors. It further shows that if a public sale may be a good place to purchase, it is a good place often to sell. But when unwashed wool in Kentucky realizes 35 to 36 cents a pound, it is only right that a sheep should be thought to be something. For its value, there is no farm product that can be carried one or two thousand miles so cheaply and so safely as wool. A ton of wool is worth $750 at 35 cents a pound, or $500 at 25 cents. A ton of wheat is worth about $33 and of corn about $16. The freight is about the same for each, and is thus 25 times more for wheat and nearly 50 times for corn than for wool. This is worth considering, and shows how much better it is to turn corn into wool than to sell it.

The American Merino is attacked in the house of its friends, for Mr. Stephen Powers in one of his very readable "Experience Papers" in the Ohio Farmer "pitches into" this defenceless animal and calls it names. He says it is inferior to the French Merino; and indeed it is if Mr. Powers's figures are true, for he declares this sheep will dress 185 pounds on a carcass of 200 pounds. Well, our best American Merino is a pretty fair mutton sheep and has dressed 120 pounds, which is a fair dressed weigh tfor a 200-pound sheep; but it must be confessed with all its excellencies, that it cannot do impossibilities. And it would seem that the feat ascribed to the French Merino is rather too good, anyhow; for 15 pounds of offal in a 200-pound sheep would hardly provide intestines enough to make one set of fiddle strings. Mr. Powers had better revise these figures.

The International Exhibition of sheep and wool, to be held at Philadelphia on and after September 20th, is a noteworthy occasion for those interested in sheep. There will be seen the best sheep from Europe in competition with our own. For not only are very liberal premiums in money offered, but the honorary distinction of successful competition there will be an attractive inducement. At this time when the sheep and wool interests are prospering in an unusual degree, those persons engaged in these pursuits and those looking to them as desirable occupations, will naturally be drawn to such an exhibition with more than ordinary eagerness. For there they will not only meet the leading men engaged in these industries, but they will have an opportunity to examine the various breeds of sheep; the different varieties of wool; the numerous kinds of manufactures of which wool is the staple material, and generally to gain such an insight into these and other points as will give them a vast fund of practical information which will be of the greatest use to them. The sum of $2,200 is appropriated for premiums for Merinos; $100 for first, $50 for second and $25 for third premiums are offered in the first classes of each breed of sheep, and there are from six to ten classes. Two hundred dollars are offered for a sweepstake premium for the best two rams and ten ewes over one year, we suppose, in each breed; $100 for first for fat sheep, and $50 for first for wool in each kind. The exhibition is to be held at the main Centennial Exhibition building, in Fairmount Park, Philadelphia, under the auspices of the Pennsylvania State Agricultural Society. It is an opportunity which seldom occurs and should by no means be missed.

EWES FOR BREEDING EARLY LAMBS.

The production of such as are suitable for this purpose, is unquestionably one of the most profitable things in which Western farmers can engage, as they are sought for in large numbers in the Eastern States, during the months of August and September to raise early lambs for the following Spring market. Such ewes are cheaply and easily bred from grade Merino, or any common stock, if put to a Cotswold ram, as on account of his greater size and fatness, he imparts these qualities in a superior degree, even to his half-bred offspring. These, when taken to the Eastern States and crossed there by South-Down rams, produce an excellent sort of early lamb, which if well fed with its dam, is ready for market in May and June, and then brings an extra-high price. Lambs which weigh from 30 to 40 pounds at three to four months of age, usually fetch from seven to ten dollars each. At this price it is very profitable raising them, as the mother's fleece shorn in the Spring, more than pays for the expense of wintering her and the service of the ram.

The Swine-Herd.

SHALL WE GROW PIGS WHICH ARE NOT MARKETABLE?

COL. F. D. CURTIS.

A radical change in the breeding of pigs is necessary. We say necessary, if the consumption of pork is to be increased. As pigs are now bred and fattened people will not eat pork except in limited quantities.

In a former article on this subject we stated that fully one-quarter less pork was consumed now in proportion to the inhabitants than formerly. Recent careful inquiries among dealers, and farmers also, have satisfied us that not more than half as much pork is used as an article of diet as when pigs were so bred as to be better adapted for food. The line of improvement for many years has followed fashion or fancy, which has demanded short noses and fat cheeks. Constant breeding in this direction has also shortened the bodies and thickened the sides, so that the modern pig has become not much less than a stuffed, rounded mass of plumpness, or animate fat. Such food is not digestible, and hence is unpalatable, even though fashion may mark it perfect in the form of a pig, and prizes be given to it by judges educated in the fancy school.

Sarcasm has pointed for years to a pig with a natural nose and a long body as a monstrosity which should not be tolerated in thoroughbred society. In the face of public opinion we must pronounce the monstrosities to be of the other sort. A pig made up of less than 25 per cent. of bone and muscle—lean meat—and the balance of lard is not food very desirable. Just about these proportions are found in most pigs. Farmers have experienced so much difficulty in selling this kind of *meat* that but few pigs are now kept where formerly large numbers were grown, and this profitable home market has necessarily been done away with.

Heavy hogs used to command the highest prices, but now in the interior country they can hardly be sold at all. Butchers who cut up and sell fresh meat, require light and thin pigs so that they can get a larger proportion of lean meat, and they complain universally about the improved, chunky pigs having too much fat. The old-fashioned, heavy hog had a long body and its natural adjunct—a long nose, as the two go together. Long noses and long bodies; short, fatty heads and short, fatty bodies are relative characteristics. Why should farmers let these fancy notions stand between them and their own interests, and why should farmers persist in producing a kind of meat that is unsuited to human stomachs?

Old breeds of hogs which possessed the characteristics of long bodies and plenty of lean meat, have had these characteristics bred out of them by continuous crosses upon the finer breeds which fancy called perfect, but about whose only virtue is that they are "easy to keep."

The pigs of the latter kind could be very much changed in their characteristics if they were made to exercise or roam about in an open field or roomy yard while growing, which would have the effect to develop bone and muscle. This will never be the case when pigs are kept closely confined. A pig is naturally, if plenty of food is given to it, an indolent animal. The approved idea and practice in growing pigs are to keep them as quiet as possible so that no food may be thrown away by exercise. It does not take a philosopher to know that pigs thus cramped and confined will have morbid appetites and eat nearly all the time. They soon get into a feverish condition which continues until butchering time, and often breaks them down before, when they are speedily slaughtered. Such pigs can scarcely walk, as their joints are inflamed, the bones weak and the tissues diseased—but they are fat.

We insist that pigs reared and fattened in close pens are not fit for human food, and yet this is the common way in which these animals are made into food. Economy may argue that there will be less consumption of food on account of quiet, as an offset against healthiness, but we are inclined to attach more importance to the latter than to the former, since in the long run health is evidently more important and also more profitable; as pigs

reared under a system which gives them plenty of exercise, which will produce bone and muscle and lengthier bodies, will better meet the requirements of the market and more ready and extensive sale.

We might add that this change of system will furnish a purer air, which of itself would be reason enough for urging a reform in the fattening of pigs. A pen reeking with filth and the vapors which inevitably arise therefrom, and which must be inhaled by the pigs, certainly cannot be conducive to health. Lungs thus constantly filled with impurity cannot purify the blood. In order to insure rapid growth and fatten pigs they are usually given food in a concentrated form, which has the effect to promote fever.

Practically, perhaps, pigs cannot always be fattened out of pens; but they can be fed food less concentrated so as to promote a healthier condition; and, practically, breeds may be selected of less chunky character, in which lean meat and fat are both combined. Either of these reforms can easily be reached and will result in improving the quality of pig meat.

The Herdsman.

GREAT SALE OF THE TILLYFOUR HERD.

This came off in Scotland on the 26th ult. The cattle were of the black polled breed called Angus, and sometimes, though not so properly, Aberdeen. The herd was bred by the late Mr. William McCombie, of Tillyfour, and has long been the most famous of its kind. Animals from it, illustrated in the Rural of February 15, 1879, received the champion prize as the best group of cattle exhibited at the great show at Paris in 1878, and they have been equally successful at the shows for years past in Great Britain, whether for breeding purposes or as fat cattle.

About 1,500 persons were present at this sale, most of whom came for the express purpose of buying. Seventy head were offered, 28 of which were cows and three-year-old heifers; 13 two-year-old heifers; 15 heifer calves; and 14 bulls from calves to two-year-olds. The prices obtained were from 11 to 270 guineas ($55, to $1,350.) The cow sold for this sum is called the Pride of Aberdeen 9th, and it is considerably the highest price ever paid for a polled cow of any breed. The sale was spirited, and the prices realized far exceeded expectation.

We are greatly disappointed to find that no American buyers were present at this sale, as the few black polled cattle which have been taken on to our great Western plains for breeding purposes, have been very successful there, and their half-bred stock from miserable, lean, long-horned native cows, have generally come of good form, and without horns. Steers of this cross bring an extra-high price in the Western markets, and are sought for with avidity, and the only fault found is, that they cannot get anything like as many as they want of them.

The Canadian Government had an agent present at the Tillyfour sale, but he did not bid high enough, it is reported, to obtain anything—the more is the pity.

Short-horn Cattle for Beef and Milk.—In a review of all the different breeds of cattle in Great Britain and the Channel Islands, by the Agricultural Gazette, it estimates the number of cows and heifers there at 2,250,000. The particular merits of each of these breeds—which are 20 in number or more—are fairly estimated as to beef and milk. Some excel in the former yet are deficient in the latter, and *vice versa;* but the Gazette emphatically adds that "It is the great merit of the Short-horn that it *holds the foremost rank in both of these classes.* The exceptional aptitude of the Short-horn cow to lay on flesh whenever, whether by accident or age, she has become no longer adapted for the dairy, is a very great addition in the eyes of the dairy farmer to her merit as a mere milk producer." In consequence of this, Short-horn cattle, which early in this century only occupied a few of the narrow districts of England, have now spread over the whole island, where moderately good pastures abound; also into the south of Scotland, and in Ireland. All the British colonies possess them, from Canada on the northwest, to distant Australia in the southeast.

American breeders have always had the good sense to take the same views on this question as the English; but in the Western States they have hitherto paid more attention to the meat than the dairy qualities of their Short-horns. In this point, however, a decided change is going on with many breeders, and to show what this is, Mr. L. F. Allen, in his circular for the next volume (the twentieth) of the American Short-horn Herd Book, has asked for accounts, whenever possible to be sent to him for publication, of the weekly, monthly and annual yields of milk and butter obtained from single cows, or a whole herd.

Field Crops.

WHEAT.

It certainly is of great importance to farmers to know the "bottom" facts of raising good crops of wheat—good in quality and in quantity. If my experiments this season will be of any value to the many readers of the Rural, they may have them so far as the results have yet been ascertained:—In 34 rows 100 feet long and about one and two feet apart, on a plot of ground six rods long by three wide, I sowed 34 varieties of Spring wheat—one ounce only in each row. Half an ounce of each kind I wet with sulphate of copper; the other half I sowed dry; three of the 34 smutted wet and dry; 11 smutted dry but not wet, and 20 did not smut at all.

I cut low with a sickle and weighed the straw which came to 210 pounds—grain 202½ pounds; all without any fertilizer and on poor soil. The largest yield produced was 10 pounds of Rio Grande from one ounce sowed, or 160 from one. The smallest yield was Sonora—56 from one.

So far as thick and thin sowing go, the result is in favor of the latter. In four rows 720 feet long I sowed one pound of seed, and in five rows of the same length, right beside the other, I sowed nine pounds of the same seed. The four rows yielded the most. Of the 70 varieties I now have on exhibtion—all of which I raised on these grounds—the most prolific and attractive are the Rio Grande, Australian, Black Centennial, Clawson. Of my hybrids Nos. 10, 13, 16, 18, 19 and 21—18 is by far the finest of any; No. 10 is next. These results are the croppings of quite poor soil without a shovelful of manure or a pound of any commercial fertilizer.

My hybrids are not yet named. When they become fixed in color, etc., I shall give them a name. A. E. Blount.

How Much Wheat Seed to the Acre?

In a late Rural a Virginia contributor said that one and a half to one and three-quarters bushel of wheat seed to the acre is the right quantity. On this head I will give my experience for three years:—In '77 I sowed one peck in rows 18 inches apart, and cultivated in the Spring—result, 35 bushels. The average crop of the neighborhood was about ten bushels per acre. In '78 I used 40 pounds of seed on two and one-third acres, and got 70 bushels. It was a good wheat year, the average yield on my neighbors' land being from 15 to 25 bushels per acre. In '79 I sowed 100 pounds of seed on five acres in rows 12 inches apart, and harvested 18 bushels per acre. This was a poor wheat season, the average yield in the neighborhood being from five to ten bushels per acre. I shall sow the last-named amount again this Fall. If our Virginia friend will again try the peck of seed with the product of which he was not content, on land less heavily manured, he may be better satisfied. If farmers would experiment more, they would learn more, to their profit. W. H.

Daviess Co., Ky.

Good Crops.

In a late issue of the Rural those who have raised unusually fine crops are invited to tell how it was done. I raised 222 bushels of very fine red wheat from seven acres, or at the rate of 31½ bushels per acre—and this after the Army worm, millions of them, had passed through the field and trimmed off all the leaves, as well as the beards and a great many of the short heads. This crop was raised on ground that had been planted to potatoes the previous year. The wheat was drilled in—about 1½ bushel per acre—from September 20 to 30. No fertilizer was used for the wheat except what had been applied in the Spring for the potatoes—home-made manure, horse dung from the city stables and some fish and fish scrap. Last year I dug from 3¾ acres—some of the land this year under wheat—1,200 bushels of Burbank's Seedling potatoes. This year I have about 14 acres under the crop, and my Beauty of Hebron is yielding from 250 to 300 bushels per acre—the handsomest tubers I ever saw. Burbank's Seedlings will, I think, do about as well. S. L. T.

Orient, L. I., N. Y.

[We are always thankful for such communications as the above. Eds.]

The Vineyard.

ELECTRICITY APPLIED TO GRAPE CULTURE.

Horticola, in the the Rural of August 21, expresses the wish that I should tell of the effects upon the grapes of the lightning that struck one of my grape trellises. It was July 27th; a member of the family happened to be sitting, face to the window, overlooking the trellis and saw the ball of fire strike the post and, scattering, play along the wires. There were four wires on the trellis which runs east and west, the ground rising about four feet in a hundred. The two upper wires were burnt off at the post; the two lower ones about six to seven feet from it; from one at least a piece a few inches long was taken out clean, and afterwards found on the ground.

The next morning the wires were mended and the vines readjusted, when, in company with "Horticola," we made observations and found no difficulty in tracing the course of the electric current by the burnt, scorched leaves and withered stems along nearly the whole length of the row. The Salem, the second vine from the post where the lower wires were cut in two, had the fruit really burnt. In a few days the effects began to be more plainly visible the whole length of the row, the berries of the Worden, at the extreme end, dropping at the slightest touch. Every few days a change was noticeable. Up to that time the vines had been well cared for, tied up and pinched in. The foliage was as heavy, thick and vigorous as I ever saw, without the least evidence of mildew anywhere visible. I certainly was very hopeful of some fine grapes, if not proud of the vines. This morning I have made some measurements and notes which will convey a tolerably clear idea of the present situation:—The stricken post stands seven feet high sixty-five feet from the northwest corner of the house down which runs one of the five seven-sixteenths-inch square rods that protect it.

The Salem vine next the post has made a strong growth; some mildew and rot present.

10 feet distant—The fruit of the Salem that was scorched, has dried up; foliage almost gone; wood well ripened; some mildew.

15 feet.—Merrimac, foliage and fruit on lower wires somewhat injured; on top wires the fruit is of fine size and color, and ripe.

20 feet.—Merrimac, fruit and vine below badly injured; fully half of the canes are dead.

25 feet.—Agawam, fruit and foliage on lower wires badly injured; fruit ripening unevenly; a little mildew on lower leaves.

30 feet.—Agawam, ditto, ditto, ditto.

35 feet.—Lindley, slightly injured; a little mildew on bottom and top leaves.

40 feet.—Agawam, fruit and foliage below more or less injured.

45 feet.—Wilder, below fruit, pink; foliage gone; above fruit, black and clusters large.

50 feet.—Goethe, foliage gone below; some rot, and some bunches gone; some mildew.

55 feet.—Goethe, lower clusters and some canes injured; mildew and rot.

60 feet.—Senasqua, part of vine killed; fruit and foliage ditto.

65 feet.—Senasqua, vine nearly killed; fruit shriveled; foliage gone.

70 feet.—Croton, vine dead, not fruiting.

75 feet.—ditto, ditto, ditto.

80 feet.—Martha, foliage injured below; mildew as abundant as on any.

85. Martha, vine, fruit and foliage badly injured; will probably die.

90 feet.—Ives, foliage below injured; canes ditto; top foliage good.

95 feet.—Ives, fruit and foliage on top injured; of two clusters hanging side by side on the same cane almost touching each other, one is killed and the other unharmed.

100 feet.—Cornucopia, vine apparently dying; foliage drying up; canes have made a strong growth.

105 feet.—Brighton, foliage and fruit injured; most of the bunches dried up.

110 feet.—Elvira, foliage almost all dead and gone; clusters all shriveled. This was the most heavily loaded vine on the trellis, having probably 10 pounds of fruit, and did not show any evidence of serious damage for perhaps two weeks.

115 feet.—Black Eagle, foliage and canes injured; fruit dried up.

120 feet.—Black Defiance, foliage and fruit all gone.

125 feet.—Cambridge, foliage and cane injured; vine vigorous; wood ripening; some mildew.

130 feet.—Moore's Early, vine and foliage destroyed.

135 feet.—Moore's Early, foliage injured.

140 feet.—Canada, fruit and foliage destroyed.

145 feet.—Canada, foliage destroyed and only two or three clusters remaining.

150 feet.—Champion, no apparent injury.

155 feet.—Champion, two or three canes killed.

160 feet.—Worden, fruit injured and most of it dropped within a week or two; foliage, with the exception of two or three canes, uninjured.

165 feet.—Worden, fruit injured; vine and foliage apparently unharmed.

I conclude that these vines are paralyzed and consequently less able to resist the attack of mildew, from the fact that the adjoining row in which are Lady, Martha, Brighton, Duchess, several of Rogers's Hybrids, etc., is as free from it at this date as any one can desire. But there are other points on which my convictions are not fixed. Did the lightning rods protect the house? Are they any protection anyway; or did the four trellis wires—which combined, would amount to about one-fourth the size of a single rod—contain more attractive capacity? Are we to conclude from this experience that wire should not be used for trellises? These are questions on which doubtless there is, and will be, different opinions; but in regard to the benefits of electricity in horticulture, I think we will all agree that the application, if made in this way, should be in much smaller homœopathic doses. What say the scientific readers of the Rural?

Montclair, N. J., Sept., 8. E. Williams.

Floricultural.

HYBRID FLOWERING PLANTS.

I noticed in the Rural of August 21st, under the head of "Brevities," that we were told that while the coleus, gladioli, and geraniums (pelargoniums) are among the most interesting plants for seedling cultivation, seedling pelargoniums are "the least compensatory," and that "ninety-nine out of one hundred will prove inferior to those in the market."

Now permit me to say such has not been my experience, at least to the extent indicated. I have of late experimented somewhat in that direction with more satisfactory results. I have now in my grounds five different specimens of pelargoniums selected from seedlings originated by myself, either of which is, in my judgment, equal, if not superior, to a majority of those usually offered in the market, and surely I have never had 500 seedlings to select from, and perhaps not to exceed a tithe of that number. True, a large majority of the seedlings are rejected as unworthy; but when I find one that is satisfactory in some distinctive feature or marking, I feel impelled to exclaim "Eureka!" and feel amply repaid for all my painstaking. To me there is a peculiar satisfaction in exhibiting such plants to others, and there is an additional satisfaction when I present a plant or a cutting to a lady friend or visitor, to be able to inform her that the kind was originated by *myself.* Call it a feeling of *pride,* if you choose, but I cannot restrain it, neither do I seek to, for I feel, in some degree, compensated by it for all my troubles and repeated failures.

One of the advantages the cultivation of seedling pelargoniums has over that of the gladioli is, that you ascertain the results so much sooner—sometimes the first season, and certainly the second—whereas with the gladioli I have always been obliged to wait till at least the third year to witness their bloom, which, to an elderly person, is a somewhat serious consideration. I have, however, some of the gladioli thus grown, which, in the estimation of good judges, are fully equal to some advertised by the florists, with high-sounding names at from one to four dollars per bulb.

The coleus will show its peculiar color and character, at the latest, within a few months after the germination of the seeds, and by those who are impatient of delay, and who are desirous to witness the results of their experiments at an early day, the coleus would probably be preferred for their purpose. But to one who has neither the necessary time nor patience to enable him to attend properly to the matter of cultivating seedling plants, experiments in that direction to any considerable extent could not be recommended. Still, I believe that something of the kind may be done by anyone who has even a small plat of ground for a flower garden. For instance, if instead of buying his verbena plants of some traveling plant peddler, or at some greenhouse, he will be careful to select seeds from the most desirable plants in bloom, sow the seeds carefully early the next Spring in boxes in the house, keep them in a suitable temperature till they germinate, prick them out into thumb pots as soon as they will answer, and set them rather thickly in the flower bed as early as the season will warrant, he will get stronger and more satisfactory plants than if he had taken them at once from the greenhouse without a previous process of hardening. True, they may not bloom quite as early, but they will usually be found to be stronger plants and more abundant bloomers through all the later portion of the season. This, at least, has been my experience.

The reason for planting them rather thickly is, that if any undesirable plants should be found among them, they may be removed without leaving a vacancy, and they can be properly thinned after showing their bloom, and only the most desirable retained. The same rule will apply to most seedlings. But with any seeds the tyro must understand that success can only be attained by care and patience and perseverance. Experience will soon be gained, which is often of more value than the most labored instructions.

Clinton.

[We should have said that "ninety-nine out of every hundred will prove inferior to the *best* of those offered in the market." For the rest, we heartily agree with our respected contributor.—Ed.]

Industrial Societies.

NEW YORK STATE FAIR.

(Special Correspondence.)

THE Fortieth Annual Meeting of the New York State Agricultural Society opened Monday morning, Sept. 13, under rather unfavorable circumstances. The sky at early morning was over-cast with heavy clouds, and at 11 A. M. a heavy rain set in which lasted far into the night, and up to the present writing (Wednesday) the sun has not been seen, and showers, cold and drizzling rains, mud and dreary dismal weather have been the order of the day. The committees have been very much hindered in their work, and it was late on Tuesday before any arrangements were perfected that tended to make any show toward a settled condition of affairs. General Superintendent Bowen, who has filled the position he now occupies for the past fifteen years, has been very busy locating exhibitors and giving directions satisfactorily and with his usual skill. And while this is true of one of the committees it is equally true of all others. The several departments are all in competent hands, and with a few exceptions, the exhibitors are all satisfied with every thing except the weather.

In point of exhibits this fair, taken as a whole, has a fuller display in all classes than any heretofore held. The flower and fruit class is the only one that looks deficient. Four years ago when the fair was held in Rochester, this department was well represented, and the exhibits were very fine, but we have not seen so full and varied a collection at any of the fairs since. A stroll among the cattle exhibitors shows as fine and varied an exhibit of thorough-bred cattle as was ever brought together. In this particular class no better or more valuable animals have ever been shown in this State. The exhibits show 85 head of Short-horns, 71 Devons, 29 Herefords, 91 Ayrshires, 56 Holsteins, 84 Jerseys and 25 Guernseys. The representatives of each one of these breeds are the finest stock, and come from the herds of our largest and best importers. The show of swine is not so large as last year; only 130 entries have been made, and these are principally Essexes, Berkshires, Cheshires, Yorkshires, Poland-Chinas. Doubtless many of the breeders of swine and sheep are waiting to make their exhibits at the International Show in Philadelphia next week. Sure it is that the show here in these two classes is hardly an average one.

The horse department presents some very fine entries, and the list comprises some of the best horses in the country. The Clydesdales and Percherons are particularly fine and noticeable, and are from the stables of our largest importers. We are glad to see so many of our farmer friends interested in draft horses, and those who have exhibited such fine specimens will doubtless receive many benefits from it aside from the coveted premiums in which all cannot share.

The poultry hall is very nicely arranged; the ground is covered daily with clean, nice shavings which present a cleanly and attractive appearance. Some very fine birds are shown. The entries comprise Light and Dark Brahmas, Buff Cochins, Partridge and Grouse Cochins, White and Black Cochins, Dorkings, Dominiques, Plymouth Rocks, Hamburghs, Spanish, Leghorns, Houdans, Bantams, etc. Taken altogether, the show of birds is a very commendable one.

On Thursday and Friday sunshine—all the more welcome after the preceding three days of gloom and rain—gladdened the exhibitors and officers and shortened their long faces with broad smiles, which grew more beaming and hilarious as the public kept pouring in from all directions. The attendance on these two days was exceedingly encouraging to the officers of the fair. The gate receipts hardly fell short of $17,000, which will prevent the Society from suffering loss by the exhibition. On Thursday the receipts exceeded those on any single day at any fair held under the auspices of the Association since its inauguration, a moderate estimate placing the number of visitors on the grounds at 25,000.

The agricultural implement manufacturers are nearly all represented and the variety and perfection of their goods are an important feature of the exhibition. It is not a little surprising to note the many advances that have been made during the past ten years among this class of manufacturers. The old-time drudgery of farm work is almost entirely done away with, and implements of all kinds take the place of manual labor. Here are machines for preparing the soil, for sowing the grain, for cutting and binding it; horse forks for handling it, and machines for thrashing and bagging it. Here, too, are corn planters to plant the corn, cultivators for hoeing it, and huskers and shellers to prepare it for the market; besides potato-diggers, manure-spreaders, bean-pullers, brick and tile machines, etc., etc,

We give below a brief description of some of the most useful and practical machines on exhibition at this fair.

WE notice first a fine display of Wm. Anson Wood's harvesting machines, consisting of two reapers and four mowers finished in a most artistic and tasteful manner. Of these machines their new inclosed-gear mower and No. 3 sweep-rake reaper attracted large crowds of people who interest themselves in this class of machines. This mower possesses many new and valuable improvements, worthy of notice, The new tilting device for tilting the points of the guards, excels in simplicity, and proves a valuable addition to the machine. By a very simple and easily operated device the guards can be thrown downward, so that in badly lodged grass, the bar catches it all up, and avoids clogging or running over and leaving the grass uncut. The eccentric for throwing in and out of gear is a very ingenious device patented by Mr. Wood, which avoids all lost motion in stopping and starting the machine in the grass—a very important factor in the working of any machine The pitman-protector and connection are of a very strong and simple design; the pitman is made with compensating heads, so that it cannot bind, and it also has a patent protector, so that it cannot bend or break if it should come in contact with any impediment. The device for raising and lowering the cutting-bar enables the operator to raise or lower either end as he may elect, and the bar can be folded for transportation without detaching any parts. As the name implies, it is an *inclosed gear*, the gearing is perfectly protected preventing the possibility of dirt and dust working in, and its operation is almost noiseless.

The No. 3 reaper is a new departure from the ordinary machines of this class, and among the new improvements in it we noticed the device for raising and lowering the platform, and tilting the same from the seat of the driver, by simply turning a crank in front of the seat. The driver can also set the platform and raker in any desired position instantaneously, without leaving his seat. This device enables the operator to deliver a perfect gavel even when reaping in lodged or tangled grain. In passing through gate-ways, the seat of the driver is turned over toward the machine, which lessens the width about three feet, and prevents the necessity of folding up the table, which is attended with labor and inconvenience. The weight of this machine is only 750 pounds. It is simple and compact in its construction, and has merits that will make it a leading machine for both our eastern hills and western prairies. During the past season, the company made and sold over 400 of these reapers, with most satisfactory results, and have orders booked for nearly 1,000 for 1881.

The company also advise us that owing to the large and increasing demand for their machines in the West as well as East, not being able to secure a suitable site in Albany for the extension of their factories it has become necessary to change the location of the works; and as the star of Empire westward moves, they will move their manufacturing works to Youngstown, Ohio, where they are now building large factories, with a capacity of turning out 20,000 machines annually With greater facilities for obtaining iron and other material for their machines, they will be prepared to supply all their trade promptly in the future—a satisfaction not enjoyed by them during their trade for 1879-'80.

They will also keep an office and storehouse in Albany, N. Y., from which their Eastern trade will be supplied with machines. They will, in their new works at Youngstown endeavor to please their patrons, and to manufacture machines, equal, if not superior to the standard of excellence for which they have been so justly celebrated.

MR. W. J. VAN PATTEN, of the firm of Wells, Richardson & Co., Burlington, Vt., exhibits the Ferguson Bureau Creamery, the sales of which, during the past year, have been very large, and in every instance entire satisfaction has been given. Among the many points of excellence claimed by the manufacturers, may be mentioned its adaptability to all conditions of temperature. In good weather, in June and October, when the best butter is made by the old way, a uniform temperature of about 60 deg. is the rule. In this way nature guides us to this point, as the one which gives the best results in cream raising. If the cows are well fed and cared for, the outside influences will have but little effect on the butter, if the milk and cream are kept at this temperature. This the Ferguson Bureau Creamery does, and hence both in Winter and Summer the results are the same, from the fact that the temperature of 60 deg. can be constantly maintained, with scarcely any trouble or expense. No dairyman should fail to carefully study and thoroughly understand the principles which govern the thorough separation of cream, as the value of his products is almost entirely dependent upon application of these principles in his business. That a uniform temperature of 58 deg. to 62 deg. is essential in making good butter, is conceded by dairyman, and the apparatus which will produce and retain this temperature, is one in which all butter makers should interest themselves. By the use of a Bureau, such as the one above mentioned, the desired results are readily obtained. All the requirements have been met by the cold-air process, which is used in Summer, and by the use of the heater the same temperature can be produced in Winter, and thus the Bureau is completely adapted for use during the entire season. Complete separation of cream is another important feature; and by no other method, can so large a quantity of butter be obtained. During the prevalence of thunder storms the milk is kept sweet until every particle of cream is raised, and an increase of from 10 to 20 per cent is the result. The use of the heater in cold weather gives the same results, for the milk is constantly kept at the same temperature.

KEMP'S MANURE SPREADER was exhibited by the Kemp & Burpee Manufacturing Co., Syracuse, N. Y.. This machine spreads all kinds of manure, coarse or fine, wet or dry, and is adjustable to spread from ten to forty loads to the acre. The manure is torn in fine particles which flow in a continuous stream from the end of the cart. The bottom is an endless apron which passes the manure to the rear, where it is torn asunder and scattered in a fine shower by a revolving cylinder set with spikes, which extends across the width of the cart. The coarsest, toughest and roughest manures are all mastered by it. It is a comparatively new device, this being only its second exhibition in this State. It was shown in full operation on the grounds, spreading at first a lot of fine manure from the canal-boats, which it did in the best shape. Its second trial was with a lot of fresh manure from the stables on the grounds. This was about nine-tenths straw and one-tenth manure. It was simply a test to see if the machine would work in manure not well rotted, and it was acknowledged by all who witnessed the experiment that the work was done far better than was expected. In fact, in *all* of the tests made it proved itself to be all that the manufacturers claim for it. Some of the leading agriculturists in the country are using it to their entire satisfaction.

MR. J. H. DE MOTT, Flemington, N. J. exhibited the Paxton Drill made by the Harrisburg Car Co., Harrisburg Pa. The working of this drill met with very many commendations. It is furnished with Shreiner's Patent Broad Cast Shovel, which involves principles long known, but never before practically illustrated. The shovel is made triangle-shaped so as to make a furrow about four inches wide, in which the seed is evenly distributed by a bell or oval-shaped distributor, which is suspended in the lower end of the shovel. An experience of five years with these shovels has practically demonstrated that they will do all the manufacturers claim for them. The feed attachment is positive and at the same time an even distributor, thus preventing all bunching of either grain or fertilizer. It also has a grass-seed attachment which is so arranged that it can be changed from rear to front in a moment's time. Moreover, the device for increasing or diminishing the amount of seed desired to be sown, requires no change of wheels or gearing—merely turning a thumb-screw does the work in a moment.

THE EMPIRE DRILL CO., of Shortsville, N. Y., exhibited their Empire Grain Drills with fertilizer and grass-seed attachments, sectional sheet-iron conductors, etc. This drill has a positive force-feed, the grain being under the control of the feed from the moment it enters the cup until it is discharged into the conducting tubes. It is accurate and reliable. The quantity is regulated by change gear wheels. Its force-feed fertilizer attachment has proved a great success. The manufacturers claim that they can save fifteen per cent. of the fertilizer used, by distributing the phosphates evenly over the surface and accurately as to quantity. The grass-seeder is constructed on the same principle as the grain-feed, presenting the same advantages. It is attached in front of the hoes, so that the seed is distributed evenly over the surface. The demand for the Empire during the past season has been very large, so much so that to-day the company are over 500 drills behind their orders. No better commendation than this is necessary.

MESSRS. SHORT & SMITH, Syracuse, N. Y., had on exhibition a full line of their three-spring wagons. These wagons are made of the best selected stock, and for style and durability they have already established a first-class reputation. The manufacturers spare no efforts to make their wares as good as fine material and workmanship can render them. They have overcome the only objection that has ever been made to the three-spring wagon—that of its being too high—by hanging the body on loops, which brings it sufficiently low for all practical purposes. The prices of these wagons are low, and the company made a number of good sales during the fair. They report that they have done a fine business during the past season, and that the prospects for the coming year are more than favorable.

THE EUREKA MOWER CO, of Towanda, Pa., exhibited Wilber's Direct Draft Eureka Mower. This mower has met with a great success during the past season. Its ease of draft, rapidity in cutting, and its leaving the cut grass standing light and loose, untrampled by the horses, allowing it to cure quickly ready for the mow, commend it to all. The company are rapidly extending their business all over the country. Their machines are all made of the best material and in the most substantial manner. The Eureka is very simple in construction, having no bevel gears or other complicated and expensive features. To show its ease of draft and the amount of work that a farmer can do with a six-foot machine, they have a report from a farmer in Morris county, N. J., who cut thirteen acres of grass with this machine inside of six hours.

THE WHEELER & MELICK CO., of Albany, N. Y., made the largest display on the grounds. Their exhibit consisted of a full line of their horse-powers, thrashers, harrows, rakes, etc. Their new safety steam generator and engine was shown in full operation, and attracted a great deal of attention. The one shown was a six-horse power, running one of their 34-inch cylinder thrashers. They claim for this engine great economy in fuel, and absolute safety from explosion. They also show the new La Dow's sulky and down spring-tooth harrows, brought out by them during the past season. These harrows have met with great success. Farmers present who had used them recommended them highly. They are adjustable to all kinds of soil.

MR. M. D. CHAPIN, of Poultney, Vt., exhibits the Wooster Creamer, which is a model of neatness and usefulness. The many favorable notices from those who are using these creamers prove their efficiency. They are made of good material in a workmanlike manner, and are guaranteed to raise the cream between the milkings, if the directions are followed. It is generally conceded that by the use of a good creamer the products of a dairy can be increased fully one-third each season; hence, as a matter of economy, they should come into general use. Mr. Chapin was the recipient of the first premium on print butter, made from one of his creamers, an honor which he was justly entitled to.

MR. P. C. LEWIS, of Catskill, N. Y., the inventor of Lewis's Potato Bug Exterminator, has on exhibition an instrument which is destined to become very popular and extensively used. It consists of a combination force-pump, which can be used for several distinct purposes, with only a moment's work in changing. With a short hose attached, it is a garden syringe; a slight change and you have a regular force-pump; another change and it becomes a very effectual sprinkler. This is carried over the top of the vines to be sprinkled, and a light tap on the handle with the hand discharges from 3,000 to 5 000 fine drops on each hill. By its judicious use a pint of the mixture will cover 30 or 40 hills.

THE VERMONT FARM MACHINE CO'S exhibit of dairy goods is fully up to their usual standard of excellence and shows a disposition on their part to keep even with this age of improvement by introducing new features in Cooley Creamers, whereby the labor of handling is reduced to a minimum and all the advantages of submerging, running off milk, etc., are attained. Their Elevator Creamers and Cooley Jr., are especially worthy of notice. The Davis Swing Churn, also one of their manufactures, is simple, easy of operation and is having an extensive sale. They also show the Eureka Butter Worker and their Sugar Evaporator.

NASH & BRO., 22 College Place, New York, exhibit their Acme Harrow, which came into general use in 1879, and is meeting with immense sales. In a single day, during their Fall trade, the orders of the firm numbered 103, coming from leading farmers in all sections of the country. As a pulverizer, clod-crusher and leveler, the Acme proves a success. It is made entirely of steel, wrought iron and wood, and for durability it is claimed by the manufacturer to be unexcelled.

HUGHSON'S WAGON CO., of Syracuse, N. Y. exhibit a full line of their wagons consisting of side springs, side bars, elliptic-top and no-top buggies. They also exhibit, as they claim, the only factory phaeton made in the State and the cheapest top skeleton-wagon—only $50. Their work is all fully warranted. They are large manufacturers exclusively for the jobbing trade, and ship their wagons all over the world

MR. W. E. LINCOLN, of Warren, Mass., exhibited a Creamery which bears his name, and which separates the cream from the milk very rapidly and successfully. The experiment was made at the request of X. A. Willard and other judges, and showed the following results: Milk was set in water at 56 deg. without ice, and showed a perfect separation of cream inside of three hours. This was considered the standard of deep setting.

MESSRS. JOHNSON, GERE & TRUMAN, of Owego, N. Y., exhibited their Champion grain drills with fertilizer, grain-seeder, hoe-shifter and corn-planting attachments. There were three different sizes, showing off to the best advantage the workings of the several important and valuable attachments. General Agent Stiles sold all of his goods on the grounds, and took a number of large orders.

BRADLEY & CO., of Syracuse, N. Y, made a handsome exhibit of their American Harvesters, Changeable Speed Mowers and Self-Dump Rakes. This company have done a fine business during the past season, and are several hundred machines behind their orders, although they have run their works to their fullest capacity.

THE WASHBURN AND MORN MANUFACTURING CO., of Worcester, Mass., had on exhibition a machine for making their steel barb fencing, which was a center of attraction during the fair. This machine barbs the wire, twists it and reels it up ready for shipping, at the rate of about 15,000 feet per day. In their factory, which has grown from a small industry to the largest of its kind in the world, they are producing 130 tons of wire per day, about 30 tons of which are manufactured into patent steel barb fencing. It is obvious to the most ordinary intelligence that what was needed to follow the discovery of a great and universal desideratum like barb fencing, was the invention of machinery for its rapid and cheap production, so as to place the benefits of the first discovery within the reach of all. Without such machinery steel barbed fencing would certainly have been an impossibility as a farm staple, on account of its cost. It has actually been made the cheapest effective fencing in existence, because automatic mechanism for its manufacture was perfected and put into use in Washburn & Moen's works, andprotected by their patents. In the manufacture of steel barb fencing, this company are associated with J. L. Ellwood & Co., of De Kalb, Ill., as owners of the patents controlling the manufacture of steel barb fencing. They also have on exhibition the Brinkerhoff patent metallic fencing, which is made from flattened steel wire, the barbs of which are of a tapering form or wedge-shaped, and are attached to the fencing at right angles with it, the taper running longitudinally with the fencing, so that it is impossible for these barbs to hook into or tear the flesh of animals, if they should come in contact with them. The average tested strength of this fencing is 2,200 pounds. This great strength is due to the fencing being made of a fine quality of highly carbonized steel. It also has the desirable feature of being galvanized after the barbs are attached to it. This is a new and very important point in barbed fencing, as it prevents it from rusting or corroding. This fencing was awarded the certificate of highest merit at the New York State Fair, Sept. 15, 1880.

S. M. CHILDS & CO., of Utica, N. Y., made a very handsome display or agricultural implements, embracing, however, but a small portion of the goods of which they are general agents and manufacturers. Their exhibition included the Tiger Self-Dump Hay Rake, Oliver Chilled Plows, Farmer's Favorite Grain Drills, one and two-horse cultivators, Iron Turbine Wind Engines, Barbed wire fence, &c. The Tiger Self-Dump Rake has been in actual use for the past five seasons, and has by its merits attained its present enviable reputation. The Oliver Chilled Plows are too well known to our readers to need an extended notice. They have secured a first-class reputation in this section, as can be attested by the constantly increasing sales. The Farmer's Favorite Grain Drill, manufactured by Bickford & Huffman, was also at this exhibit, represented by Mr. S. N. Gallup, of Macedon, N. Y. This drill has had an immense sale during the past season, and the makers' factory has been taxed to its fullest capacity, and then they could not fill their orders. The Farmer's Favorite has been long and favorably known to our readers, and its constantly increasing sales show that its manufacturers keep it up in the foremost rank. It has a double force-feed distributor, adapting it perfectly to sowing and planting all kinds of grain perfectly and uniformly. The Bonanza Grass-Seeder attachment positively distributes all kinds of grass seeds, large, small or mixed, and can be placed either on the front or rear of the drill tubes. The fertilizer attachment is accurate and complete, and was awarded the only premium in this class at the Centennial Exhibition. It was also awarded the two first premiums at the recent exhibition of the Pennsylvania State Agricultural Society at Philadelphia. The Turbine Wind Engine is a very popular machine, and is fast coming into general use. Several sales were made on the grounds. Messrs. Childs & Co. have done a large and successful business during the past season, and are making extensive arrangements to add largely to it the coming year.

G. WESTINGHOUSE & CO., Schenectady, N. Y., exhibit their improved thrashing engine connected with and operating their grain thrashing machine. This is now the fourth season with this engine, and it has made many friends in different sections of the country by reason of its lightness, capacity and economical use of fuel. This thrashing machine is so well known as to scarcely need mention, but it is safe to say that no pains have been spared to keep it fully up to the times in the way of improvement. Messrs. Westinghouse & Co. also exhibited their new 10-horse traction engine, and it presents quite a number of features which are novel in this class of engines. An important point in it is the method of communicating the motion to the traction part. Instead of rigid gear or chain connections, power is given by a belt from the fly-wheel, and this belt is controlled by a tightening pulley. The engine can thereby be started at any point, slowly, if desired, be stopped instantly, and is relieved of the effects of contact with obstructions in the track of the wheels. There is also a very simple and effective reversing gear, which is under control of the engineer, whereby the engine may be moved either backward or forward. This engine seems perfectly adapted to the uses for which traction or road engines are in demand. The entire weight of this engine, with water, is about 6,000 pounds, or from 2,000 to 3,000 pounds less than the average traction engine.

MR. O. H. P. CORNELL, proprietor of the Albany Agricultural Works, Albany, N. Y., made a very handsome display of tools and implements from the factory. The first exhibit was the La Dow Reversible Disc-Harrow. This harrow has many points of excellence which are worthy of special notice. The manner of reversing the discs is very simple, and is done in a moment's time, thus throwing the earth either in or out, as desired. They are made of steel, and in construction are simple, easily managed, and perform their work to the entire satisfaction of all who have used them. The firm also exhibited a cultivator for hoeing and cultivating corn and potatoes, which is made upon the same principles. We also noticed the new La Dow Ellipse rake, which was put upon the market during the past season. This rake has an automatic dump, which is entirely under the control of the driver, and is so easily managed that a boy or girl can use it, as the power necessary to dump does not exceed one-half pound, the horse completing the operation. The teeth are set in a balance head which revolves when in the act of dumping, thus relieving the operator from the weight of the hay and cleaning the rake perfectly. The operation of these implements attracted much attention, and they worked to the entire satisfaction of all who saw them. They also exhibited the A. B. C. Thrasher and Cleaner and Emory railway horse-power, and also the old and reliable Albany corn-planter.

THE VICTOR MOWER CO., of Niverville, Columbia Co., N. Y. had on exhibition the Improved Victor Mower of their manufacture. This company have the exclusive use of Krum's Improved Friction Rachet that catches and drives at every thirty-second of an inch. The knives start the instant the machine moves ahead, so that all clogging, no matter how badly the grass may be lodged, is impossible. This rachet is so constructed that any movement of the drive wheels, no matter how slight, will move the knives from center to center, thus absolutely preventing any loss of motion. The frame of the Victor is of wood, and the machine is well made throughout, and thoroughly tested before leaving the factory. It can be started in the heaviest grass without backing up, as both wheels act together in starting. The rachet is perfectly noiseless in its operation, a feature not possessed by any other machine. These machines attracted many visitors during the fair.

THE GALE CHILLED PLOW, manufactured at Albion, Mich., was exhibited by Wilbeck & Cunningham, local agents, of Schenectady, N. Y. Their exhibit consisted of about 25 plows of various sizes, ranging from a small one-horse plow up to large plows for three horses, and embracing two styles of wood beam and two styles of iron beam plows. The Gale plows are equipped with their peculiar standard jointer and coulter, rendering them entirely independent of any adjustment of the beam, and they are proof against all clogging in plowing under clover, weeds, coarse manure, etc. Prominent in their collection is the celebrated wrought-iron Adjustable Rod Beam Plow, that carried off the honors at the Paris Exposition in 1878. They also show a new cast-beam plow and a new wood-beam plow, No. 27, lately added to their list, and an improved wrought-iron jointer arm, with adjustable head and other improvements, keeping pace with the progress of the age.

MR. MINARD HARDER, of Cobleskill, N. Y., exhibited his Fearless Horse-power and Thrasher and Cleaner, which have become so justly popular and widely known. Mr. Harder, who has had over 20 years' experience in the manufacture of railway or tread-power machines, makes this kind of work a specialty. The fact of his having received the two last gold medals given by the New York State Agricultural Society on horse-powers and thrashers, and the further fact, known to the world, that the Fearless was the only machine that received an award on both horse-power and thrasher and cleaner at the Centennial Exhibition, render any description of the excellent work performed by this machine on the Fair ground unnecessary, except to say that on this, as on former occasions, the Fearless was the only machine in practical operation thrashing grain. Its best recommendation is to show its work.

MR. WILLIAMS, St. Johnsville, N. Y., displayed thrashers and horse-powers. On Friday of last week this company did not have a machine in their shops; they had completely sold out and were far behind in their orders; but by Tuesday morning they had a 34-inch cylinder noiseless thrasher, together with a two-horse power ready and put on the cars for this fair. It reached here in time for a showing. Mr. Williams has met with great success with his eight and twelve-horse steam-power thrashers, and also his four-horse railway powers, and has just completed a five-story addition to his works, giving him 16,000 more feet of flooring. His business has increased very rapidly, but with his greatly increased facilities he expects next year to be able to fill all orders.

MR. ROSA, of the firm of Brown & Rosa, Wellsville, N. Y., had on exhibition their new standard milk can. This can is simple in construction and operation, practical, durable and cheap. The advantages claimed by the manufacturers for it are numerous. It combines the advantages of deep setting and rapid cooling, which raises the cream in 12 to 24 hours, with either running or ice water, and it economizes water or ice as well as labor. Satisfaction is guaranteed by the manufacturers.

THE "NIAGARA" GRAPE CO., of Lockport, N. Y., make a large and really fine show of Niagara grapes. Our readers will recollect we were the first to illustrate and give a description of this fine new white grape. The attractive appearance and good quality of the fruit shown, make us hopeful that the white grape for the million has in this been found at last.

MESSRS A. W. GRAY'S SONS, Middletown Springs, Vt., had on exhibition their latest improved patent horse powers, for one, two or three horses. These machines have been in use a number of years, and for good and reliable work they rank among the foremost. They are manufactured of the best materials and in the most durable manner. Their convenience for moving commends them to parties who desire to go about from place to place thrashing and sawing wood with both drag and circular saws.

WALTER A WOOD, M. & R. M. CO., of Hoosick Falls, N. Y., made a fine exhibit of their Automatic Binder. Their machines were in full operation, and the work done by them was fully up to their standard of excellence.

MR. HENRY IVES, of Batavia, N. Y., exhibited a new and very useful implement for hoeing corn, and also a combination shovel plow, which attracted considerable attention.

P. K. DEDERICK had a full line of hay presses in operation; also exhibits of portable engines and other implements from his manufactory.

E. C. RICHARDSON, of Poultney, Vt., interested a great many dairymen with his Surprise Churn.

BELCHER & TAYLOR, Chicopee Falls, Mass., exhibited the S. R. Rye Improved Rake, and also their Fodder cutters which are becoming so extensively used. G. B. B.

THE NEW ENGLAND FAIR.

(Rural Special Report.)

THE Seventeenth Annual Fair of the New England Agricultural Society opened on the 7th inst., at Worcester, Mass., and closed on the 11th, having been continued one day longer than at first announced, in order to carry out the full programme, which was interrupted by a heavy rain and wind storm during nearly the whole of the 10th. Financially and otherwise the exhibition was a decided success, the receipts fully equaling those of last year, which left a balance of $5,000 in favor of the New England and Worcester County Agricultural Societies, under whose joint auspices both fairs were held.

Fine as were the exhibits in all departments, the display of live stock seemed to attract unusual attention, and certainly fully deserved all the consideration it received. It is very doubtful whether so fine an exhibition of choice specimens of the chief breeds of farm stock has ever before been witnessed in New England; certainly the writer has never seen so many fine animals at any of the numerous fairs he has there attended. Of cattle there were, in all, 741 head, a large majority of which were pure-breds, many of them very fine specimens of their respective breeds.

THE JERSEYS in number seemed to surpass all other classes, and judging from the constant crowds about their stalls, and the frequent praises of them, they certainly seemed to be the favorites. In their appearance, however, there was less to attract admiration here than at almost any other fair at which I have seen them. Little or no attention seemed to have been bestowed on "slicking them up" for exhibition, but the adage "handsome is as handsome does" expressed the public sentiment in their regard. The principal exhibitors in this class were, O. B. Hadwen, of Worcester, Mass., with 17 head; W. H. Hopkins, of Providence, R. I., with 12 head; and S. C. Colt, of Farmingham, Conn., with 15 head.

THE AYRSHIRES, also, made a fine display, one exhibitor, B. J. Stone, of Westborough, Mass., showing 27 head. Herbert Merriam, of Weston, also had 10 very fine animals, and S. M. & D. Wells, of Weathersfield, Conn., 13, one of which had a milk record of 61 pounds per day. There were several other exhibitors, too, and the entire class bespoke the high opinion entertained of this breed among New England farmers.

HEREFORDS made a finer show here than at any Eastern fair at which I have seen them, and deservedly attracted a great deal of attention. Burleigh & Bodwell, of Hallowell, Me., showed 35 head, and J. B. Hawes, of South Vassalboro, 14 head. All the specimens were fat, sleek, and in fine condition in every way, and if more care were bestowed on presenting the merits of this breed in a proper manner at our agricultural fairs, it seems not improbable that they would soon become powerful rivals of the Short-horns, especially in those sections in which milk and its products are of slight importance in comparison with beef.

SHORT-HORNS were less numerous and in poorer condition than they are usually seen at such exhibitions. There were only 47 of them, none of which would win admiration for its beauty as a beef animal, though some were highly spoken of as milkers. I looked for specimens of some of the Vermont deep-milking herds, but saw none.

HOLSTEINS were well represented by W. A. Russell's head of 28 from North Andover, Mass., and a couple of other exhibits. In the Russell herd the imported, 11-year-old cow, Lady Clifeden, had a record of an average milk yield of 49 pounds for 311 days; or 16,274 pounds for 372 days, the highest yield in one day being 78½ pounds. With the Holsteins were the Swiss, which in this section have a good reputation as dairy cows. They have thick necks, broad hips, and the calves and heifers were extremely handsome. D. C. Aldrich, of Auburn, and J. A. Bancroft, of Worcester, were the chief exhibitors.

THE GUERNSEYS — two from Herbert Merriam, Weston, and the herd of Col. A. Warren, Pomfret, Conn.,—were separated from the Jerseys and put in a class by themselves. They were considerably larger and in much better condition apparently than their relatives.

DEVONS made an unusually large and fine display, the chief exhibitors being Harvey Dodge, of Wilkinsonville, with 16 head, and W. Eames, of Worcester, with 14 head. The steers of this breed make excellent draft animals, the cows are fair milkers, and both are nearly as hardy as Ayrshires, and, like them, they seem well adapted to New England hills and rugged pastures.

OF GRADES there was a large exhibit, those of Hereford, Devon, Swiss, Holstein, and Ayrshire descent being especially fine. The display of fat cattle was poor.

HORSES were more admired in the speed ring, where trotting for purses took place daily, than in the show-yard, where the display was meagre.

OF SHEEP there were 132 fine animals in 37 entries, chiefly South-Downs, Oxford Downs, Shropshires and Merinos. The Shropshires seem to be gaining rapidly in public favor here as well as in England, and they certainly are a fine breed, judging by the specimens here exhibited by Burleigh & Bodwell, Fairfield Centre, Me. I certainly expected a finer display in this department, but most of the great Vermont breeders put in no appearance. Moreover the International Sheep Exhibition, to open on the 20th at Philadelphia, must be attracting the finest specimens of every prominent herd in the country.

SWINE made a fair show, nine exhibitors contributing 61 animals, mostly Berkshires, Poland-Chinas, and Suffolks.

POULTRY made a fair but noisy show, numbering 150 coops, contributed by 33 exhibitors. All the chief breeds were represented, Plymouth Rocks, Light Brahmas, Buff Cochins and Bantams being the most noticeable.

OF AGRICULTURAL IMPLEMENTS there was a large and fine display, chiefly of goods made by New England manufacturers.

OF FLOWERS, vegetables, fruits, bees, household utensils and domestic manufactures, there were as fine displays as are usually seen at such exhibitions, all attracting deserved attention from crowds of visitors. L. H. W.

Miscellaneous.

STUDIES AT AGRICULTURAL COLLEGES.

A FRIEND from Louisville, Wisconsin, writes us:—I should like to see some articles in the RURAL in regard to the State Agricultural Schools. Do they not do more harm to farmers than they do benefit to farmers' sons? I know several young men in this section who have attended such an institution, but not with the intention of becoming farmers, but in order to prepare themselves to hang out shingles as lawyers, with a superabundance of whom the country is already afflicted. I think that a State Agricultural School should confine its teachings to subjects which will tend directly to make its pupils good farmers. Medical colleges do not include in their curriculum topics which have nothing on earth to do with their specialty, however excellent they may be as parts of a liberal education. Theological seminaries keep to their specialties, without thinking it necessary to teach a smattering of all knowledge; and why should not agricultural colleges "stick" to their own special business, instead of turning the minds of the students away from the very pursuit their fathers would wish them to follow, by offering them opportunities of pursuing other avocations more alluring mainly because requiring less labor? I would like to see farm boys better educated; but I hate to see the "makings" of a good farmer become a poor lawyer, the transformation having been unwisely encouraged or brought about by an agricultural college. It seems to me that agriculture—not law or medicine or any other profession—should have the benefit of the public lands donated to agriculture by the general government. Almost everything I see published on this subject is from the pens of professors at some of these institutions, and the half-apologetic tone of their remarks when referring to the conduct

of agricultural colleges, shows pretty plainly that they themselves—or at any rate the best of them—are not quite satisfied with the present condition of things there. They seem to be constantly on the defensive, without any visible assailant; always excusing, without any accuser; setting up men of straw, to knock them down easily—all of which is likely to beget in the public mind more than a suspicion that "there is something rotten," or at any rate not quite right, in the management of our agricultural schools and colleges."

BRIEFLETS.

It is time to make preparations for Spring bulbs. Hyacinths should be planted a foot apart and six inches deep. Tulips about the same distance apart and four inches deep. The soil should be deep and mellow. A mixture of ordinary garden loam, muck and sand—enriched with old manure—is excellent. The little sprightly crocus should not be forgotten. Purchase heavy, solid bulbs. . . . . "I have often noticed that where people are too poor to keep a dog, they generally keep two, and let them pick up their living where they can find it"—says C. R. D., in the N. Y. Tribune. "This is particularly noticeable in sections of our country where the colored brother predominates, there being sometimes a dog for every male member of the family, boy and man." . . . . . The Crown Imperial may be interspersed among the Spring bulbs—so, indeed, may the showy narcissus, but a bed of hyacinths and tulips is so pretty in themselves, that we prefer to have the narcissus and Crown Imperial separated from them. Last Fall we planted crocuses here and there beneath the sod of the sloping banks of the lake. The effect was beautiful. The blossoms pass away before it is necessary to cut the grass. . . . . Rev. John Earle long ago wrote: "For botany has this great practical advantage over all other sciences as a means of universal culture, that the materials of it are the most generally accessible of any scientific materials in the world. Within the ordinary walking circuit of every habitation, unless it be in the heart of a great city, are to be found data for the whole study of botany. . . . . Ellwanger and Barry of Rochester, N. Y., have tested many of the new peaches which have been advertised as earlier than the Amsden, and they find that Waterloo is as good and early as any of them. . . . . Prof. Sheldon's "Dairy Farming" speaks of a new antiseptic which will do away with common salt in preserving butter. It is called Glacialine. It is tasteless, odorless and perfectly harmless. Prof. Sheldon has tested it to his satisfaction. No doubt it will soon be offered for sale in this country. . . . . The farmers need the immense quantities of fertilizers which cities produce and city people cry out for more cleanliness. Thus we have the supply and the demand. How unfortunate it is that the two classes cannot more profitably utilize this relationship. . . . . T. Z. Bullock of Delaware Co., Pa., has a hen now in her twentieth year. She has not laid an egg in ten years. . . . . The London Garden in a late number says: "It is to be hoped that American raisers, unlike ourselves, will not worry themselves and others by sending out many things, such as the tomato and melon, in which no real improvement and little change is visible." The writer of the above note cannot have seen our Acme. There has not been, it seems to us, for many a year, a more marked improvement in any fruit than is shown in this and the several varieties that have sprung from the seed, all of which, as they do not differ materially from the parent, are not entitled to distinct names. . . . . Mr. John B. Moore of Concord, Mass., sends us by mail a bunch of his Moore's Early Grape. It is the first we have ever eaten, our own vines not yet having borne. In quality we prefer this to the Concord. It bears a close resemblance to Concord in appearance and, being earlier, is well worthy of general trial. . . . . A friend makes the remark that he thinks Prof. A. E. Blount as much a benefactor to mankind as the originator of the Early Rose Potato. We think so too. . . . . Mr S. D. Fisher, of Illinois, reports from Fultz wheat a yield of 43¾ bushels per acre. It was drilled in at the rate of but 1¼ bushel per acre. Fultz is, as he says, a very hardy variety, and the straw is strong and not liable to rust.

WHAT OTHERS SAY.

Dwarf Pears.—Mr. J. J. Thomas, Horticultural Editor of the Country Gentleman, has been visiting some of the fruit farms about Batavia, N. Y. We commend his remarks to the consideration of Mr. Quinn, that unrelenting enemy of dwarf pears. In the town of Oakfield he found several well managed and profitable orchards of dwarf pears. Lorin Rathbun has a ten-acre pear orchard, chiefly of the Duchesse, the trees being sixteen years old. They are set twelve feet apart, and the outer branches nearly touch each other. A few years since this orchard bore 1,205 barrels of fine pears, or over a barrel on an average for each tree. They were sold at $5 a barrel, giving $6,000 for the crop, or $600 per acre for the entire orchard. This was his most profitable return, although in other years it has done well. The best paying crop on a small area several years since was from an older orchard of a little less than the fourth of an acre, which produced 19 barrels, and which sold for $18 per barrel, making the sum of $340, or at the rate of $1,360 per acre. In the same neighborhood Julius Reed has a fine 400-acre farm, with some excellent orchards. From one-third of an acre of dwarf pear trees—all Duchesse, set 22 years—he has sold the fruit in the different years since bearing commenced for $2,340. Mr. Read has a fine apple orchard, from 20 to 24 years old. The trees were planted 24 feet apart, with the intention of thinning them when the tops began to touch each other.

Fruit Farms in Western N. Y.—Mr. Eli Taylor of the town of Elba, occupies 420 acres of good farm land, and he has an admirable dwarf pear orchard of two and three-fourths acres. The net profits of the pear trees have, on an average of years, been equal to the net profits of all the farm besides, and in some years have exceeded those of the farm. There are over 1,000 trees, 15 years old, planted 10 feet apart, and their average product has for several years averaged about $1,000 a year. Mr. Taylor now plants his trees 12½ feet apart. He manures them moderately every year, and cultivates the ground. The trees are about 10 feet high, are all Duchesse, and were bending under their heavy crops. He furnished the following statement of his receipts for the past nine years, which shows the continuous profits: The trees were set in 1865, and in the year 1871 they bore

21 barrels which sold at $10 per barrel, or for			$210
In 1872, 175 barrels sold	at	$5.50	962
1873, 230 "	"	5.50	1,265
1874, 210 "	"	6.00	1,260
1875, 330 "	"	5.50	1,815
1876, (no crop).			
1877, 460 barrels	"	4.00	1,840
1878, (no crop).			
1879, 160 barrels	"	4.50	720
			$8,072

1880, crop not yet gathered, but Mr. T. expects 400 barrels.

The experience of orchardists through this region of country (around Batavia, N. Y.,) gives the strongest preference to the Baldwin among apples for profit, and to the Duchesse among pears. The large size of this pear makes it profitable in market, and its hardiness and resistance to the blight add greatly to its value. Where pear orchards were planted many years ago of different leading varieties, it is common to find that all have disappeared by disease or feebleness except the Duchesse; and fine orchards of this sort, covering several acres, with scarcely a vacancy, the trees from 10 to 20 years in bearing, show its general reliability. A single variety, however, ripening nearly at a fixed period, can never give a full supply for the market through an entire season, and experiments should not be relinquished to obtain a succession, at least through Autumn and Winter, of equally reliable sorts.

The Soiling Cattle Question.—Major Freas would like to know what progress the principle of soiling cattle is really making in this country. The question has now been before the people for many years. Our agricultural papers have teemed with editorials recommending it, and correspondents have from time to time given glowing accounts of the advantages to be derived from its general adoption. In fact, we have even seen figures from those who have tried it, showing that nothing in the whole range of farming operations had been so very profitable as the practice of feeding cattle—or soiling them, as it is called—over the old plan of allowing them to roam at will over the pasture-fields. That this is a wasteful way there is no doubt. The cattle tread down a good deal; their manure spoils much more; they are exposed to heat and drought and plagued by flies; they tread the land down hard and solid, which is unfavorable to vigorous vegetation; but worst of all is the heavy outlay in fencing required. Then the manure they make is scattered about, dried up by the winds and mostly wasted, while, when the cattle are fed in a yard, the manure-pile which follows is by no means to be despised; indeed, it is the best bank account a farmer can have.

With the many advantages which can thus be shown, and which are unanswerable, why is not soiling more popular? The Major suspects it is the labor question over again. An extra hand has to be employed to cut and feed cattle so treated, and it is likely that the farmer who cannot at times get hired help at any price, will not be powerfully captivated with figures which he cannot realize, however correct they may be. He has of necessity to get along as best he may, with no help or little help, letting go the chances to make larger profits, which he could do if he could get men to work for him at moderate wages.

The labor question is indeed the great question of the times. It is worse now than it was before the era of improved machinery. Most people could manage to find profitable work for a man or two all the year round; now the temptation to do without manual labor, except at seed-time and harvest, is great. If this is not the secret why soiling has failed to become generally popular, the Major would like to know what it is.

Patent Flour.—The American Miller gives in a few words the gist of how this is manufactured: The best flour used to be made of Winter wheat. Spring wheat yielded either much less in quantity, or else so much of the bran got into the flour in its manufacture that its color was intolerably dark. The wheat would be ground and then bolted. In the refuse—the bran and middlings—would be included a large proportion of the weight of the Spring wheat, and this would sell more particularly for food for horses. Now the best of flour, and the most expensive, is made of this very refuse of the old-fashioned process. It all came out of the discovery of a way to draw out the bran. Under the new process the wheat is ground about as before. The first result is an ordinary flour sold for exportation. Then the remainder is taken and put upon great horizontal sieves, and while agitation is going on there, an ingenious system of draught is rushing up through, and carries off the bran. What is left are the glutinous portions of the wheat, the most nutritious and most productive, and out of these, purified now by the drawing off of the bran, we get our new-process flour. The result of the discovery of the process has been to make the poor Spring wheat of Minnesota and upper Wisconsin the most valuable kind of grain.

Mr. James Vick thinks, and we fully agree with him, that fine specimens of vegetables or fruit grown in any way that is impracticable for a general crop ought not to be allowed in competition at our fairs and shows. The great value of a fine exhibition of garden or field products depends upon its demonstration of the worth of the method, or methods, employed in producing it. This fact should always be kept in mind by examining committees, and when any entries are made of articles grown under conditions not available in general cultivation, they should be ruled out of competition.

A writer in the Ohio Farmer says that he is not an old wheat raiser, but has not lived these last few years to no purpose, and thinks he has struck the key note of success in raising wheat, in a thorough fitting of the soil before sowing the seed, and he is convinced that a poor piece of land, dragged, rolled and then refitted until the ground is as mellow as an "ash heap," will produce a better yield of wheat than a rich piece of land poorly plowed, half dragged, and the seed scattered among the lumps and clods, and a portion of it without covering or any chance to germinate and obtain a hold.

Swindlers at Fairs. An editorial in the same excellent farm journal speaks of the number of professional swindlers who attend the fairs, whose sole business is to rob unsuspecting people of their money. They travel from one fair to another, the entire season, and wherever they can gain admittance to the grounds with their devices, they are sure to reap a rich harvest. This is evident from the large license fees they offer for the privilege, varying from $50 to $2,000, according to the nature of the device they operate with. One of the "Wheel of Fortune" men, last year, told the the writer of this that he paid $1,500 for the privilege of three days at a certain fair and then cleared $1,500! And this is only a small per cent. of the money lost by the persons who patronize the wheel. The fortune wheel is only one of a thousand ingenious and deceptive devices used to entrap the unwary, every one of which is an outrageous fraud. We beg our readers, now, at the outset of the fair season, to frown down this swindling and robbery, in every way possible. Don't go near them, and keep all others away over whom you have any influence.

Perhaps the heaviest returns ever obtained in this country from a single sheep were secured last year by Daniel Smith, of Hinsdale, N. H., says the Germantown Telegraph. He raised from a Shropshire ewe three lambs, which he sold for $18, and the wool of the ewe for $1.50, making the total income from one sheep $19.50.

To Call Sheep.—"Our friend, C. B. Eaton," says Colman's Rural World, "who prefers to live on the cheap hills of the Mississippi River, with enough rich bottom lands adjoining, rather than go to Texas or New Mexico to raise sheep, has taught his flock to come by blowing a horn. His 400-acre pasture is every part of it within easy hearing of his conk shell. The sheep will lift their heads at the first toot and come on the full run so see what is wanted of them. They expect and always get salt or corn for their obedience at the call. It saves many a long tramp."

Harvest potatoes always in cool, clear, weather and when the soil is dry, that the potatoes may come out clean. Whether unearthed by hoe, patent digger or plow, give the outside moisture time to evaporate previous to storing. Moisture is favorable to heating, which in turn induces decay; hence it is necessary to have the potatoes thoroughly dry, especially when a considerable quantity is to be put away in bulk.—Farm and Fireside.

September Management of Bees.—This is, in our opinion, the best time in all the year to introduce Italian queens, or to change queens in any hive where the bees are not in all respects what you wish, or if the queen is not prolific. Even if you have good Italian stock, it pays to get an imported queen or a queen from a new strain from a reliable source.

Remove honey boxes as soon as filled, or small frames from boxes. When removing them it is useless to put on an empty box now as you would do earlier in the year, as bees seldom begin in a new one. But remove a partially filled box to the place from which you took the full one, as the bees that have been engaged in sealing that one over will go on with the same work in another.

As soon as frost comes (the very next morning if possible) remove all boxes, for in a short time the bees will begin to take honey from them.—Bee Keepers' Magazine.

(Continued on page 647.)

Everywhere.

RURAL SPECIAL REPORTS.

Fla., Ocala, Marion Co., Sept. 5.—Sunday morning, 29th, ult., opened with one of the most severe and violent cyclones or tornadoes ever seen in this portion of Florida, at least. I have never before witnessed anything to compare with it. It was awful, fearful. It blew a perfect tornado all day and night until Monday evening, when it began to relax. At times the storm seemed to shake the very earth, bringing down the unripe oranges in showers, so that they covered the ground, and battering the trees to pieces. So terribly violent was the wind that every shade tree in town—oak, hickory and sycamore—are prostrated, giving the place a forlorn and wrecked appearance. The orange crop of the whole State must have suffered greatly, and been entirely ruined in many sections. Cotton, too, has been whipped to destruction, and the bolls are scattered everywhere. There are sad reports, too, of shipwrecks and loss of life along the coast. W. H.

Illinois, Baileyville, Ogle Co., Sept., 10th.—"What will the harvest be?" might now be supplemented with "What has the harvest been?" Haying began here about the 15th or 20th of June; but as the weather was showery and at times quite wet until after the Fourth of July, a large amount of hay was damaged; and as most of the old clover was killed or eaten by cut-worms in the early part of the season, the hay crop throughout this section was light and the quality poor. The late crop has proven better than the early; and as straw is plentiful and corn-fodder will be abundant (if the farmers will save it), there will be no scarcity of "rough" feed for stock the coming Winter. The winter wheat and rye harvest began the 2nd. and 3rd. of July, and was followed by the barley, Spring wheat and oat harvest, which continued until about the 5th of August, by which time all, or nearly all, had been put in stack. As a large portion of the Winter wheat failed last Winter, and was plowed up in the Spring, and a considerable amount of what escaped winter-killing proved thin and weedy, the Winter wheat yield throughout this region is light, yet it averages better per acre than the Spring wheat. The latter was injured by the hot humid weather and chinch bugs at the time it was maturing, and is not over half an average crop. Some fields were not worth harvesting; others were tolerably good. The rye was generally a good crop—it seldom fails here. Barley, an average yield, but badly stained. Oats are light in weight, but measure out well. Thrashing began here about the 5th ult., or as soon as the harvest closed, and the machines were all busy for some two weeks, when wet weather set in and no thrashing has been done since. The weather has been extremely warm and wet the past two weeks. This wet spell was preceded by a drought of a few weeks' duration, so the rain was needed and has done much general good to the Fall crops and the pastures and by putting the ground in fine condition for plowing; but it has also done some harm, mildewing the grain in stack, etc. The loss to the farmers from their grain growing that was not securely stacked or in barns, will be severely felt. Those were fortunate who got their grain thrashed before the wet weather set in. From what was thrashed we learn that the yield varies greatly. Winter wheat yields from 10 to 30 bushels per acre—will probably average about 13 or 14 bushels.

That which was drilled in on good, well drained ground proved better than what was sown broadcast or among the corn. Spring wheat is not averaging over seven or eight bushels per acre. Rye yields 20 to 30 bushels per acre; barley 25 to 30 bushels; oats 35 to 60 bushels per acre—will average abont 40 or 45 bushels, I think. But it is difficult yet to estimate correctly the general yield of the various crops. Corn is very promising in this locality, but south of this it has suffered severely from drought. It is now nearly out of danger from frost. Our early potatoes have not turned out as well as was anticipated. The Beauty of Hebron has proved better than the Early Rose planted side by side at the same time and cultivated alike. We think the late potatoes (Peachblows) will do well, but cannot tell yet. Garden vegetables and small fruits have been very plentiful, and apples are abundant and cheap. All things considered, notwithstanding the partial failure of some crops, this has been a bountiful season so far and the farmers have prospered in general. W. B. D.

MINN., Tracy, Lyons Co., Sept. 8.—Crops are good here, especially flax, of which there is a good deal raised. Some have thrashed and report a yield of 10 to 20 bushels per acre. Several farmers have from 150 to over 200 acres of flax. A company from Philadelphia has located here, and is putting in machinery to work up the fiber. They own land here and have raised considerable flax this year. D. P.

N. Y., Tonawanda, Erie Co., Sept. 12.—The Beauty of Hebron potatoes proves to be ahead of the Early Rose here. The tubers are larger and the yield 100 per cent. more, planted side by side. I agree with what Colonel Curtis says in a late RURAL in regard to his neighbor's practice of spreading raw manure on sod and plowing it under. It may not agree with the theories of those who profess to farm scientifically, but practically it answers an excellent purpose, as the abundance of the crops shows plainly at harvest time. I clean my barnyard every Spring and Fall; consequently the manure is all raw; but I think my average is probably as good as that of some who use concentrated manure and have cellars and compost, at much expense. My average wheat yield for eight acres of sod, put in after mowing, as above, was 32 bushels per acre of Red Mediterranean, and on eight acres of new land, black soil mixed with clay, the average was 30 bushels of Clawson. I hold that high-bred stock and fancy strains of animals and composting manure to drag in with the grain, and a great many other fancy notions held forth by writers, will not pay a practical farmer to follow. I work the land at the right time and well; give it plenty of stable manure and clover, and I find ample returns from the soil, as a consequence. C. F. R.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Feeding Pigs.

H. T. M., no address, says: "I remember reading a few months ago of an enthusiast who laid himself out for fattening hogs at a cent a day. His plan was to mix corn meal and salt in water, until it fermented. May I ask if this is the best way to prepare a substitute for whey; if so, must it be hot water or cold, and must the liquor be banged up, or prepared in an open barrel. Cut hay and meal steamed, I suppose, is the most economical food for Winter. Help your readers to the knowledge of fattening the poor man's pig."

ANS.—We do not recall the statement to which H. T. M. refers, but corn meal wet up with water and a pinch of salt (no more than the pig needs) would be considerably better than whey for the poor man's or any other man's pig. Whey is mostly milk sugar before fermentation turns it into lactic acid, and has not sufficient muscle-forming matter to grow the muscular system of the young pig. Whey is only fit to be given to lean, grown hogs that need only to be filled up with fat, which the milk sugar is well adapted to do; but much of the whey fed from cheese factories has undergone so much fermentation as to be nearly worthless for pig feeding, unless mixed with linseed meal, decorticated cotton-seed meal, wheat bran, oats, or other food rich in muscle-forming matter. As to keeping a pig upon one cent per day, it must be a very small one, or kept upon a very small ration—and in either case the result would also be small, and perhaps discouraging. We cannot encourage the readers of the RURAL ever to expect anything but a square, honest return for the food given to the pig or any other animal. It is always so much for so much, not "something for nothing." If in the West corn be purchased for 28 cents per bushel, this would give two pounds for one cent, but two pounds of corn are only sufficient food for a pig that weighs 25 to 30 pounds; and, for such a young pig, corn alone is not a proper diet. It does not contain a sufficient proportion of nitrogen to grow the muscular system. The pig is a grass-eating animal, and young clover and corn meal will go well together, because the clover is more nitrogenous than the corn meal; but half bran and corn is better. So the cheapest food in Summer is grass, corn and bran, as these will keep the pig healthy and give it a rapid growth. Grass cut and fed in the pen will answer every purpose. For Winter feeding, a little linseed meal (one-fourth to one-half pound) per day, and the balance in corn meal or bran is as cheap as anything. A little fermentation will improve it, but it should not get much sour. After using the slops of the kitchen, a little of these other foods will fatten the pig rapidly. The pig utilizes its food better than any other one of our domestic animals; but there should be no half-way in his feeding; let him have a full diet.

Mange in Swine.

W. H. M., Warren, Ohio, asks for a remedy for mange in swine.

ANS.—Mange in the lower animals is of the same nature as itch in human beings, and in all cases is due to the irritation and ulceration caused by the burrowings of minute insects, all of which pretty closely resemble each other, though they are known by different names according to the animals they may infest. The disease is contagious, always requiring for its development the passage of the mites or their eggs from diseased to healthy animals. This transfer may take place by the sound animal coming in contact either with an ailing one of the same kind, or with some object on which the mites or their eggs have found a resting place. Any animal may accidentally be the carrier of contagion from diseased to healthy subjects—for instance, a dog can carry the disease from one hog to another—but it is essential for the development of the disease that the insect should be proper to the animal, so that a mange insect of swine cannot produce mange in a dog; this can be done only by the mange insect of another dog. In swine the disease usually shows itself first on the thin skin under the arm-pits and thighs and on the inside of the fore-legs. Small, red blotches or pimples appear at first, and these spread as the insects multiply and burrow under the skin. The only way to rid any animal of the mange is to kill the mites that cause it and their eggs. This can be done only by application of the remedy to the parts affected. It may be well to give sulphur and other cooling medicines in the food, but the insect and its eggs must be killed by local applications. The body should first be covered with soft soap and thoroughly washed with warm water and well brushed; a good wash is made of one part of caustic potash to fifty parts of water; or one part of creosote to forty parts of water, well mixed; or a decoction of tobacco in the ratio of one to twenty-five. Carbolic acid, diluted, is also an effective wash. Several poisonous applications are also sometimes used in severe cases, but we do not recommend such dangerous remedies. A day or two after the thorough application of either of the above washes, the body should be again well cleansed either with the same wash or with potash lye. All the surroundings of the affected animals, too, should be thoroughly cleansed, such as the sty, rubbing places, etc., at least twice, at intervals of a couple of days, so as to kill the mites that might in the interval hatch out. For this purpose, a covering of lime or chloride of lime or a good rubbing with petroleum will generally prove effective. It would be well, however, not to put any sound hogs into the pen of a diseased one for a month or two after it had been disinfected. Most of the above will also apply to mange in other domesticated animals.

Remedy for Collar Galls.

J. O., Momence, Neb., asks what is a good wash for sores on a horse's shoulder.

ANS.—In order to prescribe properly, we ought to have a more particular description of the sores—whether they are running ones, have been of long standing, etc. If they are mere collar galls, they are easily and quickly cured by first washing them out clean very gently with warm soap-suds: let them dry and then apply a thin smearing of white lead. This usually dries up galls in three or four days. If during this time it is necessary to use the horse, put a breast collar on, and do not work him hard, and only part of the day. We have often cured galls by applying neat's-foot oil to them two or three times per day, or as often as it dries. We presume sweet oil or whale oil would do pretty well, but kerosene would be too harsh. Keep flies away from the sores, and anything else likely to irritate them. To prevent galls, take the horse with his collar on him to a saddler and let him see that it fits properly. Then keep it clean of lumps and dirt, and lightly oiled inside every week or two with neat's-foot oil. If the inside leather of a collar is kept soft and pliable, and it is of the right size, and fits snugly to the shoulder, it scarcely ever galls the horse.

Remedy for Ticks on Sheep.

H. B., Cobbleskill, N. Y., asks for a remedy for ticks on sheep.

ANS.—The way to get rid of this pest is to dip the sheep in some liquid which kills the insects. Of the various preparations used for this purpose Crysilic Sheep Dip is as good as any. A safe and very effective one can also be made of tobacco and sulphur in the proportions of four ounces of the former and one of the latter to a gallon of water. The water is brought to a boiling heat, and the tobacco, either coarse cheap leaf or stems, which are equally good, is steeped (but not boiled) in it until the strength is exhausted. The sulphur is then stirred in the liquid. When it has become reduced in temperature to 120 degrees, it is ready for use. The sheep are entirely immersed in the liquid so that the wool is completely saturated. The dipped animals should be kept in a yard until the wool no longer drips, lest the pasture should be fouled, and the sheep sickened by the tobacco juice. After ten days the dipping is repeated to destroy any newly hatched mites.

Cow and Sheep Manure, etc.

G. E. N., Afton, N. Y., asks, 1, whether Guenon's work on the escutcheon in cows is illustrated; 2, will a ton of hay give manure of the same value for crops, if fed to sheep as it would if fed to cows; 3, what is the best breed of sheep for that section.

ANS.—1. Yes. 2. As cows produce milk, it is readily understood why they should abstract more of the nutritions qualities of their food than sheep which only supply the waste caused by the exercise of the vital functions. Hence the manure from cows fed on hay alone (or grass) is very poor; while that from sheep is much richer in fertilizing elements. Practically, we should estimate sheep manure to be worth nearly twice as much as cow manure. 3. What is the best, depends upon the use the sheep are put to. If for mutton and wool, the best would be native grade ewes crossed by Cotswold or Hampshire-Down rams. If your pasture is light South-Down would make a better cross for your locality.

Arbor-Vitæ from Cuttings.

W. J., West Salem, Wis., asks how to propagate arbor-vitæ from cuttings.

ANS.—Flower-pots well provided with drainage and filled with sand will answer. Make the cuttings five inches long. Remove the lower leaves and a part of the upper ones. Insert these two inches deep in the sand. Place the pots in a temperature above 40 deg., and shade them from hot sun. They will strike before Spring. Arbor-vitæ cuttings may be placed in mellow soil out-of-doors. If protected and looked to occasionally they will form roots.

Miscellaneous.

T. D. B., Greenville, Ky., asks, 1, for the cause and a remedy for the rotting of Acme tomatoes on the vines; 2, will it pay to give three dollars per cord for tobacco stems; 3, would it be cheaper to get superphosphate of lime or guano for vegetables, or stable manure at $2 per two-horse load, the commercial fertilizers having to come by express. Having been told that most seedsmen sell their best specimens of melons, tomatoes, etc., and save only the refuse sorts for seed, he asks, 4, whether we can name a seed grower who sells seed got from the finest specimens only, 5, which is the better plan, after hauling forest leaves—to spread them on the ground and turn them under or to compost them with a little manure or other fermentable matter?

ANS.—1. If tomato vines are planted too closely together, the first to ripen are apt to rot because they receive too much moisture and too little sun. But we have had many complaints as to the rotting of the Acme, and it may be owing to an infirmity in this kind. 2. That depends upon the purpose for which you need them. Not for manure assuredly. 3. We should prefer at that price the manure, if of good quality and procurable near home, so that cartage would be inexpensive. 4. It is to the interest of all seedsmen who value their good name to procure the best of seeds and we believe that that is the rule. 5. It would be best to compost the leaves or even to place them in a pile to rot rather than to spread upon the land and turn them under.

A. W., Southhold, N. Y., says that his daughter budded some cherry and peach trees last season according to the directions given in the RURAL, but only one peach grew. The buds of the cherry trees didn't start at all; some of the peach buds started, but afterwards all died with one exception, and he asks the reason why; also, 2. how tall will the Amorpha fruticosa grow—is it a tree or shrub.

ANS.—1. The failure in budding is probably due to the fact that the work was not done at the right time. Remember the bark must part freely from the wood, else the inserted bud will generally fail. For the rest, the bud must be cut clean and inserted at once or kept moist until it is inserted. The bark must be bound firmly over the inserted bud, so as to exclude the air and insure contact. Strong, well-ripened buds should be secured, and after insertion they should be shaded from hot sunshine during the day. 2. We have an Amorpha fruticosa (False Indigo) six years old that is seven feet high. It never grows beyond the bounds of what may be called a tall shrub.

F. W. G., Fulton, N. Y., sends two specimens of potatoes, one marked with a colored; the other, with a white string. The former is from the Beauty of Hebron seed sent out by the RURAL, and it yields better than the other, which has been sold as the Beauty by a prominent seedsman. Both are good; but he wants to know which is the genuine Beauty. He has raised, this year, 20 bushels of that sort, and says they yield better than the Early Rose Snowflake or Early Vermont.

ANS.—We have just dug an experiment plot of one-fortieth of an acre of Beauty of Hebron potatoes, and we have carefully compared the two specimens sent with them. The difference in these two specimens is simply in the color of the skin. One is white, the usual color of the Hebron; the other is pinkish. The potatoes of two hills of our plot present just this pinkish appearance. All the others are like the specimen tied with a *white* string. We say that they are the same potato.

G. H. B., Reedsville, Pa., asks, 1, where can he get seed of Walker wheat, and 2, what other varieties would be likely to do well in central Pennsylvania besides Fultz and Clawson.

ANS.—Walker wheat is extensively grown in East Tennessee and also in some other sections, as may be seen by reports in our issue of July 10. It is a smooth-head, medium, quite early winter wheat, yields fairly and is suitable for a rich soil. Some say it is red, others amber. It may be there are two varieties of the same name. We do not know where seed can be had. 2. Lancaster, Mediterranean and Dehl are reported to do well in that section, and it might be advisable to try Muskingnm, Shumaker or Silver Chaff which we can speak well of from personal experience.

A. N. B., Carlisle, Pa., asks for a fuller report of our crop of Blount's White Prolific Corn, and whether we would sell him a bushel of seed.

ANS.—We shall give a full report as soon as harvested. The ears average medium size—larger than last year. We are satisfied that this Blount's Corn can be much improved by careful selection of seed; that is to say, more ears can be raised per stalk, it will ripen earlier, the shanks can be shortened, it can be induced to grow not so tall, and to bear its ears not so high upon the stalks. If we should succeed in materially improving it in the above respects, we shall again place it in our Distribution. We do not sell anything except the RURAL.

C. C. G. Lockport, Ill., sends for name, 1, a leaf of an ivy-shaped twiner; 2, a doubly serrate, acuminate leaf from a wild shrub or young tree; 3, a flower that came from Dakota.

ANS.—1. We cannot name plants from the leaf alone as a rule. This may be Menispermum Canadense, the Moonseed Vine. 2. You must send us a fruit, or flower, or both. 3. This seems to be Cleome rosea. The order is Capparidaceæ—not Cruciferæ.

G. J. T., Coxsackie, N. Y., asks who makes the best apparatus for drying fruit, and the price.

ANS.—The American Drier Company, Chambersburgh, Pa., make as good a fruit evaporator as any we know. Different sizes have different prices. Write for full information which will be promptly furnished.

E. W. K., Glens Falls, N. Y., sends flower and vine for name.

ANS.—The flower is Gentiana Andrewsii, a very pretty flower commonly called the Closed Blue Gentian. The vine is the Moonseed Vine—Menispermum Canadense.

W. S. F., Reedsville, N. C., asks how far north will Pearl Millet seed ripen.

ANS.—Three years ago it ripened at the RURAL Grounds, about latitude 40.43. As a rule it will not ripen so far North.

J. A. Van T., Webster, Ia., sends an apple for name.

ANS.—The specimen is so bruised and discolored that we are unable to say what it is. At a guess we would say that it is Lowell, but we cannot be certain.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY SEPT. 25, 1880.

A POTATO EXPERIMENT.

AT the suggestion of Mr. D. S. Marvin we planted a row of potatoes last Fall on November 12. A potato of medium size, of a very productive new variety which is not yet introduced, was cut in 18 pieces (single eyes) which were placed one foot apart in a drill six inches deep. One pound of potato fertilizer, mixed with soil, was strewn over them, and the drill filled in and leveled. Over this a mulch of coarse salt hay and Red Cedar boughs was placed as a winter protection. Every piece grew, and the vines were large and healthy. The row was dug September 6, and the yield weighed just 18 pounds, being variable in size, and in shape by no means symmetrical.

NOTICE.

BEGINNING as soon as the White Elephant Potato is harvested, we shall send them to our subscribers as they apply, the weather (temperature) permitting. The seed distribution will not begin until the latter part of the year. Subscribers may apply whenever they choose, of course. It would, however, save them some trouble and a trifle of expense if they would apply for the seeds in the letter renewing their subscriptions. They will be forwarded as early and surely in the one case as in the other. We request our good readers not to stick their stamps to letters, and to make application for seeds on a separate slip of paper, being careful to give full address, written as plainly as possible. We request also, as a matter of fairness to us, that those who cannot give our seeds a careful, *pains-taking trial* will spare us by not applying for them.

NEW CROPS AND NEW INDUSTRIES.

In a new country, where the people are not yet masters of all the branches of industry which bring wealth and employment, new industries are continually suggesting themselves, many of which may easily be adopted and established. In flax growing the fiber has, as yet, but little value, and there are no linen manufactories in the United States. The silk worm is also not yet acclimated here. The great source of profit in beet, sorghum and corn sugar is but just beginning to be known. The alpaca wool and Angora hair product are yet small in America, as are the jute and ramie products. The cultivation of tea and coffee and many other semi-tropical products have a great future. Add to these the thousand of little industries which each locality may have for using up raw materials and working them to the highest values, and but a small part of the possible production of the country yet exists.

THE WORLD'S FAIR AT NEW YORK.

THE selection of a site for the World's Fair, at New York, in 1883, has been referred to a select committee, chosen from members of the executive committee, and they are visiting all the localities under consideration for the purpose of examining into the advantages and disadvantages connected therewith, and will report to the executive committee in a short time.

The absence, in Europe, of several prominent persons who wish to be among the subscribers to the first $1,000,000, and the great interest taken in the political campaign, have suggested the postponement of the time of opening the subscription books to the 10th of November, when it is expected that the full amount will be at once put down. The increasing interest in the project is shown daily by the many letters of inquiry and suggestions received by the Secretary, and the numbers of applications for space for exhibits, and the directors are confident that this will prove the largest and most successful exhibition ever yet held in any country.

BOOKS OF REFERENCE—PROPER INDEX.

TIME is money, and to the editor often more than money—life. When he picks up a book to refer to some point he knows to be discussed in it, yet finds no reference to it in the index, with what weariness he opens and searches through a treatise to find what a proper index would have referred him to in a moment. Perhaps the greatest sin committed by compilers of books is the utter neglect to give any analytical reference to the points discussed. The want of a proper index renders many of our books of reference of little value.

If we examine the voluminous reports of the State agricultural societies—most of them are without an alphabetical index, without any analysis of their contents. Take the 32 volumes of the Transactions of the New York State Agricultural Society—a work that would have for the student and editor great value, if it had analytical indexes to the contents—and a half-day may be lost in searching for the discussion of a point.

The Legislature of New York should be asked to appropriate a sum sufficient to compensate a thorough agricultural scholar for making a complete analytical index for the 32 volumes, and thus render them of some permanent value. Let us ask the gentlemanly and accomplished Corresponding Secretary of this Society if he cannot afford to give us a proper index to the future volumes?

THE RURAL BRANCHING SORGHUM.

THERE is nothing among the seeds of our next Distribution regarding which we have greater expectations than the Rural Branching Sorghum. We cannot think otherwise. Our plants which have not been cut, are marvels of luxuriance, eight feet in hight—bearing wide, long leaves, and more of them than upon Indian corn. The plants cut August 5, are now four feet high and may now be cut again. *New* forage plants are dangerous things to commend. We have not forgotten Prickly Comfrey, Pearl Millet and several kinds of Doura, Egyptian Corn, etc., which, lauded to the skies within the past few years, are now rejected as of less value than corn. We do not know its origin any further than that our friend, Mr. Satterthwaite, of S. C., procured a few seeds from Florida some years ago and has raised it upon his farm in preference to corn, millet or any other fodder plant. It will appear to our readers that we have much to lose and nothing to gain by unduly praising our Branching Sorghum. By another season it will have been distributed over the entire country, and thousands before the close of another year will have tested it and can judge whether our praise is merited or not.

We have learned by three trials that there is but one way to sow this sorghum so that its growth and yield shall be satisfactory. We shall speak of this way later and trust that, whether it meets the approval or disapproval of our farmers, they will, as a matter of justice to us, follow it to the letter.

SOUTHERN PROGRESS.

THE indications of a rapid recovery and growing prosperity of the Southern States is at this time too apparent to be denied. With the beginning of the business year, September 1st, the papers in the larger cities are publishing comparative statements of trade, and from these there is every indication of a rapidly growing prosperity.

As we go down the coast the extending fields of early vegetables and fruits show that there is profit and employment in the cultivation. Inland there is an increase of the number of acres of land in cultivation, and there are more machinery in use, better tillage and more attention to manures. Little manufactories and home repair and machine shops are rapidly increasing, while oil mills, foundries and cotton and woolen mills are becoming institutions of very many States. The commerce of the coast cities is largely ahead of that of last year, and a feeling of confidence prevails with a much greater apparent spirit of enterprise among old settlers and newcomers.

In the Mississippi Valley the same increasing prosperity is still more noticeable. The commerce of New Orleans is one-half greater than the previous year, and the Mississippi River is not only the Father of Waters, but is becoming the mother of an immense inland commerce.

In nothing is this prosperity more apparent than in the increase in the number of little and great industries which so much cooperate in using the raw material and in supplying home requirements, without the necessity of long transportation between the markets and sources of production. These are among the greatest auxiliaries to the farmer's prosperity.

THE PRESERVATION OF FORESTS.

At the meeting of the American Association for the Advancement of Science, lately held in Boston, the Committee on Forestry submitted the draft of a memorial to the Governors of the various States calling their attention to the necessity of preserving and cultivating forests to supply our future demands for timber. Eight recommendations looking to this end are made in the memorial. Laws should be passed in the different States protecting trees planted along the highway and encouraging the setting out of such plantations by proportionate deductions from highway taxes. The increased value of land due to the planting of trees thereon should be exempt from taxation until some profit may be obtained from the plantations. Money should be appropriated to enable horticultural and agricultural societies to give premiums for tree planting, both for the largest areas set out and the best management.

Prizes are recommended for the best essays and reports upon practical forest culture. Encouragement should be given to all educational institutions in introducing practical instruction in forestry. The distribution of seeds and plants among the agricultural community is advocated, so are the establishment and maintenance by the State of model plantations under the care of men trained to the profession of forestry; and the appointment of a commission of forestry under State authority, of the same nature as the commission on fisheries now established in some of the States; and, last but most important, the need of more stringent laws for the prevention of forest fires is urged. Great as is the yearly destruction of our forests to supply timber for building purposes, for domestic manufactures, for fences and railroad ties, for fuel and for exportation; yet in some years the waste caused by forest fires greatly exceeds the amount of timber cut for use or destroyed to meet a real or supposed necessity, as in cases where thousands of acres of trees are annually burnt or girdled to make clearings.

THE GRAIN FIELDS OF THE NORTHWEST

THE extraordinary product of wheat upon the vast plains of the Northwest, surprises even Americans, who are rarely excited by any possible development of their own country; but it astounds and dismays Europeans, who see in it a ruinous competition which their farmers' cannot resist. When the Northern Pacific Railroad was proposed, it was only through the sanguine and speculative spirit rife in the flush paper-money times of 10 years ago, that the public went to its support with a somewhat reckless and blind faith in the judgment of its projector. But that great speculator builded better than he knew, and by a great stroke of unexpected good fortune it has been found that the territory opened by that road covers the most fertile and extensive wheat fields in the world. These fields at present, though only penetrating upon a narrow border, are producing one-tenth of the whole wheat crop of the United States. The great success of wheat culture in this territory has given a surprising impetus to the construction of railroads. No less than six railroads are penetrating this wheat district and as these advance a vast brigade of farmers flank them on either side and even precede them in a wide front. In the newly organized counties on these lines of road there are already 516,354 acres under wheat cultivation, and further west, in the great valley of the Red River, 208,032 acres are already occupied. In addition to these, 1,696,896 acres of land were entered by occupiers in 1879 and are being prepared for wheat; and as these lands need but the plow, the whole of this area, and possibly as much more, will be under cultivation within another year.

The system of culture upon these farms is one that reduces the cost of the product to a minimum. Farming is done under a system of discipline like that of an army. A brigade of plows advances in an unbroken front and traverses a field miles in length. Drills follow and hundreds of acres are seeded in a day. At the harvest self-binders advance "*en echelon*," or one slightly behind the other, making no turn until they have traversed miles, when they wheel with military precision, and, without stop, lay down in sheaves 500 acres of wheat a day upon one farm. The harvest of one farm requires 35 cars a day to carry it to market. Not only is wheat produced in this manner at the least possible cost, but each acre of this fertile land produces as much as two to four acres of land upon the majority of Eastern farms. With such competition comes a serious question, not only to European farmers, but to our own farmers in the East—what will be the result to them of this new dispensation?

BREVITIES.

WE are pleased to know that our Mold's Ennobled oats took the first premium at the State Fair.

FURTHER special reports of the fairs, and of the N. Y. State fair in particular, are crowded out of this number. They will appear next week.

THE production of wine at Egg Harbor City, N. J., last year, as stated at a recent meeting of the N. J. State Board of Agriculture, was 200,000 gallons. The principal grapes grown are Concord, Clinton, Taylor, Martha and Delaware.

THIS year's stock of seeds of the hybrid pentstemons which we sent last year to our subscribers, has been disposed of to London seedsmen at a very high price. In the letters received from our friends little mention has been made of their success with these pentstemons, perhaps because they have not yet bloomed.

PROFESSOR BLOUNT writes us: "I wish you could slip into my room and see a "*show*." Everybody, both men and *women*, stand aghast at seeing so many kinds of wheat—nearly 70 bunches hanging by the roots, all labeled and no two alike. Every one of them is far finer than the (Eastern) seed from which it was raised."

IT is reported that the British steamer Thanemore, Captain Sibthorp, which sailed from Baltimore August 29, for Liverpool, lost 225 head of fine fat cattle on the passage. When will such shocking murders of poor beasts cease, for it is nothing less than this. Our Government ought to put a stop to it as soon as Congress next assembles, for individuals never will. The hope of gain and a recklessness of results will spur them on to the end of time in their heartless, unmerciful shipments.

THE representatives of the RURAL NEW-YORKER hereby extend their sincere thanks to Superintendent Bowen, Secretary Harrison, executive officers, James Geddes and his assistants in the Agricultural Implement Department of the New York State Fair, as well as to Mr. Owen of the Cattle Department, and to all officers of the Association for the kindly interest shown in their behalf, and for the many courtesies which they have so often received at the hands of these officials.

THE Irish potato crop, we are assured, is extraordinarily good. The yield is exceptionally large and rot unusually scarce. There is no doubt that this satisfactory condition is mainly due to the introduction of many new varieties of seed from this country and Great Britain. The old sorts were not only "running out" from the same causes that produce that effect here, but they seem to have become especially liable to rot, a liability from which the recent introductions appear to be at present in great part exempt.

THE English Agricultural Gazette, in describing the market gardens of Bedfordshire says that in the district of Potten the soil is such a powerful absorbent of all kinds of coarse manure, that a standing fable is told there of a man once plowing in a field, who, for some fault or other, laid the boy who was driving the team, down in one of the furrows, and plowed him in. Upon his being searched for the next day, nothing could be found of him but his jack-knife and the buttons of his coat. The fate of this boy would have been quite different had Peruvian guano been first sprinkled in the furrows; for according to a veracious Connecticut legend when this was once done the boy by the next morning had grown tall enough out of the ground to cap the highest trees in the surrounding neighborhood.

ON the first of this month one-fourth of the grist tax was abolished in Italy, and the remainder of this grievous burden upon the lower classes will disappear on Jan. 1st, 1884. It was levied for some years upon the grinding of all grain, and so high-priced were flour and bread in consequence that the "common" people had to subsist largely on poor corn meal porridge. A loathsome disease somewhat like leprosy very prevalent among the lower classes is attributed to this diet. The abolition of this odious tax was stubbornly resisted by the aristocracy, as it brought in a heavy revenue from the sufferings of the people, and thus enabled Italy to maintain a position as a military power among European nations. To keep up this position in future some more equitable mode of taxation must be devised than that which made starvation and disease epidemic among the people.

TIME FOR SOWING WHEAT AND RYE.—The best time for this generally, is from the 10th to the 25th of September, in latitude of 40 to 43 deg. Later sowings answer farther south, even to the last of November, according to the latitude. It is best to sow as early as convenient, so that the plants may get well rooted before frosts sets in, and then they are not so likely to winter-kill, or heave out during the freezing and thawing of March weather. If by early sowing, or an unusually mild and prolonged Autumn, the grain gets up too rank, it may be fed off by sheep or calves; but be careful not to let them do this except when the ground is dry and firm, otherwise they will poach it badly and injure the crop. Rye and wheat, are now sown much more extensively than they used to be, and especially by dairy men, for Spring soiling. We know nothing in the way of cultivated crops that comes forward as early as these, or that can replace them for the purpose of soiling during the month of May and early in June.

Literary Miscellany.

BY THE STREAM.

SWEET tangled banks, where ox-eyed daisies grow,
And scarlet poppies gleam;
Sweet changing lights, that ever come and go
Upon the quiet stream!

Once more I see the flush of splendid wings,
As dragon-flies flit by;
Once more for me the small sedge-warbler sings
Beneath a sapphire sky.

Once more I feel the simple fresh content
I found in stream and soil,
When golden Summers slowly came and went
And mine was their spoil.

I find amid the honeysuckle flowers,
And shy forget-me-not,
Old boyish memories of lonely hours
Passed in this silent spot.

Oh, God of nature, how thy kindness keeps
Some changeless things on earth!
And he who roams far off, and toils and weeps,
Comes home to learn their worth.

Gay visions vanish, worldly schemes may fail,
Hope proves an idle dream,
But still the blossoms flourish, red and pale,
Beneath my native stream.

—Sunday Magazine.

INMATES OF LESTER HALL.

CHAPTER IV.

(Continued from page 630.)

IN THE COUNTING-HOUSE.

"Is Mr. Lester in his office, Mr. Jason?"

"No, sir. Mr. Lester has not yet arrived."

"When he comes, request him to come to me at once."

So saying, and without waiting for the clerk's "yes, sir," Mr. Daton passed on into his own office, a handsomely fitted-up room, with a rich Turkey carpet, elbow-chairs, a writing-table with all kinds of elaborate arrangements, and a capacious waste-paper basket.

It was nearly eleven o'clock on a gray March morning in the third year of Rex Lester's residence in London. It was Monday morning, a busy morning with most people; the clerk's in Mr. Daton's large establishment had been busily at work since nine o'clock, and several letters and telegrams were awaiting the head of the firm, piled upon the desk. Glancing at the little heap as he entered, Mr. Daton passed on to the mantelpiece, and stood there for a minute or two lost in thought; and judging from the expression of his face, the subject of his meditation was anything but a pleasant one.

Things had prospered with him; hard work, perseverance, and indomitable energy, had raised his fortune to its present hight, and in the mercantile world no name ranked higher, no credit was more deservedly good than his. In his private life he had seen great trouble: he had married a young and beautiful woman to whom he had been engaged some years; they had passed together twelve bright cloudless months, at the end of which she had borne him a son, who survived his birth twenty-four hours, and the young mother had never gotten over the shock. She lingered a few days and then died with her hand in her husband's and her head upon his breast, smiling into his eyes, and whispering with her last dying breath of her love for him and of the happiness of their married life.

Henry Daton did not marry again, and people said that he had never recovered the great double loss he had sustained, and that he had been graver and colder in manner from that day; but he said nothing about it, never touched upon his loss, but devoted himself to his business with increased activity. Some thought him cold and indifferent, and said that he had no heart, no thought, save amassing wealth and becoming rich; but these people did not know that in a secret drawer of his writing-table there was a long curl cut from a dying head, and a little tiny bit of soft yellow hair which the young mother's feeble fingers had cut from her baby's head ere it was laid in the little satin-lined coffin. What would those good people have said if they could have known that the bit of tissue paper in which these were folded held what was dearer to the merchant than his wealth and power!

"Not come yet," muttered he to himself, as he turned away from the mantelpiece with a gesture of extreme annoyance. "After all I said to him last week. It is too much!"

He crossed over to his writing-table, and seating himself, began to open his letters with a preoccupied manner, and it evidently required some effort to bring his mind to bear upon his business. But in a few moments he shook off his preoccupation and, having finished his correspondence, he took up each letter one after the other, wrote a few words on each, the substance of the reply to be written by the clerk, and placing them in heaps of five or six letters separately, he touched an electric bell, which was answered almost immediately by Mr. Jason, the head clerk, who had been in Mr. Daton's employment for many years.

"Distribute these, if you please," said the merchant, handing him some letters. "Has there been any message from Carter and Andersen."

"No, sir; but a clerk from Julian and Sons' has been here this morning about that invoice; the mistake was theirs."

"Ah! I thought so. Mr. Lester has not come yet, I suppose?" continued Mr. Daton, with an assumption of carelessness, as he turned to his desk again.

"No, sir."

"Very well. That will do. By the way, Mr. Jason," arresting the man's steps as he turned to the door, "when Mrs. Briant comes to-day tell her that she is to have an annuity; that she can send her eldest son here to-morrow. See what you can do with him,"

"Yes, sir; thank you sir," said Mr. Jason, with a glance of respectful admiration at his employer; and as he left the room he thought how few merchants, however wealthy and influential, took the trouble to look after the widows of their deceased under-clerks and provided for their wants.

Left alone, Mr. Daton wrote one or two letters, glanced occasionally at the clock, and he had just taken from one of the drawers of his writing-table a small account book, which he was examining with an expression of annoyance, when there came a knock at the door.

Mr. Daton lifted his head abruptly, closed the book, but did not replace it, and said:

"Come in."

Upon this the door opened and admitted Reginald Lester, who came into the room with an air of easy nonchalance, and wished his uncle "good morning."

The three years which had elapsed had made a considerable alteration in Reginald Lester; the handsome, fresh-colored youth had grown into a man, tall and slender, pale and worn-looking. He was handsome still, but in a very different style; his face was thin and pale; the hazel eyes, so like Cecil's, were dim and weary, as if with late vigils into the night; the mouth was almost hidden by a long, silken, fair moustache, evidently an object of great care. He was dressed in the hight of the fashion, and wore delicately-tinted kid gloves, which he was leisurely removing as he entered the room: he had a camellia in his button-hole and a superb diamond ring on the little finger of his slender, white right hand. He was a very different Rex Lester from the one whom we met at Lester Hall three years ago, and the alteration in him was one which could not have pleased those who were really interested in him.

"Good morning, Uncle Henry, I am a little late, I believe," said Rex, in a languid tone.

"Good morning—a little late?—yes; it is on the stroke of two," said his uncle, coldly.

"Is it possible? I'm awfully sorry; but I came straight here, sir," said Reginald, looking a little ashamed.

"You keep late hours," said Mr. Daton, in the same cold tone of voice; while Rex, still a little silent and ashamed, went over to the fire and stooped to warm his hands.

"Where did you spend your evening?" said his uncle, abruptly, after a pause.

"I dined with Carew and some other fellows.,"

"The old story," said Mr. Vicars, suddenly rising and pushing aside his papers impatiently. "I saw you, and I wondered how you, Reginald Lester, could find pleasure in such society."

"All young men do, sir," said Rex, rather sullenly.

"Young men who are idlers and thrown upon their own resources, which amount to nothing, perhaps. Not young men like you who work, or ought to work, for their daily bread."

Reginald's pale face flushed and his eyes flashed; for a moment he seemed about to speak, but he refrained, and in a moment Mr. Daton continued.

"This is not the first time that I have had occasion to find fault with your conduct," he said: "but my remonstrances do not seem to have had much effect. Your conduct has been for many months extremely displeasing to me. You have neglected your business—you have entirely disregarded my wishes. You have been extravagant, careless, dissipated, and have associated with those whose companionship is neither beneficial nor desirable. I have excused you more than once on the grounds of your inexperience and of the greatness of such temptations as those into which you have fallen to some natures; but surely such pleasures must begin to pall upon you now! I believe those of your race have always been more liable to them than many others; but I had hoped much from the influence of your mother's memory and of your sister's goodness. I had hoped much, but my hopes have fallen to the ground."

His voice was mournful as he concluded, and Reginald stammered some words of apology and regret.

"Cards, dice, horses, and bad company, these are the rocks on which you strike, even as your ancestors did. You care nothing for high and noble aims—for goodness, purity and truth; such words are words only in the ears of the youth of the day, the things they express have no real existence. Have you no higher desires than to be an empty-headed gambler, a dissipated young fellow? Looking back at the records of the past four months, it would seem so in very truth."

"You are bitter, sir!" said Reginald, in a low, sullen tone. "I am not worse than most men of my day and generation."

"Not worse? No; I pray Heaven you are not half so bad as many! But is your life a worthy one—answer me that, if you please?" said Mr. Daton, rising from his seat and confronting his nephew sternly.

"You do not make allowances, sir, said Reginald.

"Allowances for what?" said his uncle, sharply. "For your youth, perhaps? I have been young myself. For your position? Its novelty is over; you must have gotten accustomed to it now. Oh! I have been lenient—you cannot say otherwise! See!" He turned to the table, and took up the book he had been examining—"I have been looking over this book, and I find that I have paid heavy debts for you in the last eleven months, and though the sum may not seem excessive to you, it represents by no means the whole amount of your expenditure. You will remember that although I was desirous of finding a son in you, I gave you no hint as to the future disposition of my property. Had my son lived I would not have behaved to him more liberally than I have behaved to you, but I would have forgiven him less!"

His voice shook a little as he concluded. Reginald's face cleared slightly; but he looked remorseful and ashamed.

"To what does it all lead?" said Mr. Daton, in a moment. "To what can it lead, Rex? To ruin! You must break from these companions; you must give up the society of those who are leading you astray. It will require but one effort—a strong one, perhaps, but you are man enough to make that, surely! Make it, and I will forgive the past folly and extravagance!"

"I will try—upon my honor I will try, sir!" said Reginald, with a sudden outburst of earnestness and compunction.

"I hope so," said his uncle, all the sternness gone from his face and manner. How could he be stern when Rex looked at him with those hazel eyes, so like those of his dead sister, the lad's mother, whom he had loved so dearly! "I will believe you, Rex; and as a first step on the new road," he added with a slight smile, "we must clear off all outstanding debts, and start with a clean bill of health!"

"You are very good, Uncle Henry," said Reginald, confusedly.

The color flashed out into his face for a moment and he turned again to the fire, bending over it with a shiver and a sharp, hacking cough, which called up an expression of anxiety on his uncle's face as it was bent over his check-book.

"You have not gotten rid of your cough, lad," he said, as he dipped his pen in the ink.

"No; I have had no chance!" was the careless answer. "The weather is against it."

"But you must be careful. Here you are, lad. And Rex," continued Mr. Daton, impressively, "I want one promise from you."

"What is that, sir?" said Reginald, as he took the check, which his uncle handed him.

"That you give up gambling," said the merchant, sternly.

Reginald hesitated a moment.

"If you wish it, sir—yes!" he said, quietly.

"Very well, I trust you, Rex. Now you can go, as I am busy. There is some work for you on your table, and see that those debts are paid, remember!"

"Yes; thank you, sir!" said Reginald, as he left the room, and went to the office appropriated to young Mr. Lester, who was looked upon by most people, including himself, as Mr. Daton's heir, and treated with consideration accordingly.

Reginald's office was a much smaller room than that occupied by his uncle, but it was equally comfortable, and much more ornate in style. A blazing fire burnt on the hearth, and a cushioned arm-chair was drawn up beside it, into which Rex sank in an attitude of careless, easy comfort, and sat there for some time with the check still held between his fingers, and an expression of absorbed interest and meditation on his face.

Looking back, he saw that he had given his uncle a promise he was not at all likely to keep. How could he? Every man in his set played more or less high; it was impossible for him not to do so. And if he had lost a good deal lately, the run of luck would turn, and he would win. Uncle Henry could not expect him to keep that promise; still, if it pleased the old fellow, said Rex to himself, carelessly, he would let him imagine that he had given it up.

Reginald's sense of honor was apparently blunted, or he would not have found it so easy to excuse himself for breaking his word.—To be continued.

NEW ZEALAND.

LIFE in New Zealand naturally divides itself into different modes—as, indeed, is the case in other parts of the world; and it is spoken of as a whole, these distinctions force one into a more detailed consideration of the subject. Few things can be more unlike than life in the country and life in the town—or, again, than life on a station and life on a farm; and these differ widely from the lives of diggers and miners and those of lonely shepherds and lumberers. Like revolving circles, which touch but never mingle, those different existences cross and recross each other; so that it is impossible to give a fair account of our colonial life without touching, more or less, on all of them.

In New Zealand the inhabitants are neither enormously rich, none abjectly poor. The necessaries and most of the luxuries of life are common to all who are moderately industrious and prudent. The luxuries and æsthetic pleasures of wealth—art, science, literature, the charms of elegant leisure and of really good society—are unattainable by any. Life is reduced to simpler elements than would be possible under an older, wealthier, and more elaborate civilization. Yet this simplicity, which is to many minds the greatest charm of a colonial life, is leaving us year by year. As the land is opened out, and the population becomes larger and more settled, new wants arise, and the luxuries of former years are the necessaries of these.

Probably the first thing which strikes a traveler on visiting our towns—and here I speak chiefly of Dunedin, Christchurch, and Wellington, the great commercial centres—is their resemblance to the smaller cities at home, the centres of provincial industry; but after a long residence, and under a closer scrutiny, it is the difference which impresses itself most forcibly; and as time goes on, and one's knowledge of the place increases, this difference becomes more and more apparent, and the first fancied resemblance fades entirely away. We miss the old time-honored buildings, with perhaps a cathedral or abbey church dominating all, below it a quaint town hall or market place, and streets of warm red-brick houses, where generations of men have been born, lived, died, not without impressing their personality on the brick and timber, the rooms and staircases—houses that were homes where the heart-strings clung even round the shabby old furniture for the sake of the "had been" which made every nook and corner sacred. Memories of this kind find no place in our antipodean cities. Here all is new or hopelessly squalid and so shabby that the greatest lover of antiquities would condemn it on the instant. Many of the Dunedin firms have erected splendid warehouses which would reflect no discredit on the banks of the Thames or the Mersey; but the streets of ordinary shops and dwelling-houses, built chiefly or entirely of wood, and seldom more than half finished, may indeed be dwelling-places, but can never be homes. Another feature of our town life is the restlessness of the population. Rarely do you find a family occupying the same house for several years in succession. Business men change their offices as they would change their gloves. This restlessness and love of change is a notable feature of colonial society. Onward, not upward, is the universal cry. Make money—honestly if you can, but anyhow make it, and a natural outcome of all this is a contempt for things poor and old.

A society where nothing is venerated for the tender memories of those who are gone, loved because they loved it, prized because they prized it; a society where we do not honor our parents irrespective of their individual merits, where we laugh to scorn the apostolic injunction, "Fear God, honor the King," is not a satisfactory state of society, as all will acknowledge who have ever experienced anything better. Of the boys and girls growing up in our midst it is not too much to say that they are mere savages in regard to what you call culture, and to those polished graces of mind and manner which are the outcome of high civilization. Shall I say that they also escape many of its attendant weaknesses; that they are stronger in mind and body, more robust, more energetic, more self-reliant? In justice I must admit it, and add that their helpfulness, industry and fertility of resource are worthy of all praise. Still they shine more conspicuously in the kitchen and in the farmyard than in the drawing-room. A liberty which approaches to license prevails in their social relations, and makes one bitterly regret the absence of self-control, based on self-respect, which forms so important a part of the old home training.

Town life and the society of towns naturally intermingle. In the country, of society properly so called, there is none. We may have neighbors, half a dozen families within a radius of ten miles, or perhaps half the number at double the distance. However that may be, we must take them as we find them, and make the best of them. We must "be to their faults a little blind, and to their virtues ever kind," if we would escape becoming hermits on our farm or station. Our country neighbors we cannot criticise; we take them as they are, and are thankful to them for breaking the drear monotony of our lives. But in towns it is otherwise; there you may to a certain extent choose your own surroundings, and there the peculiar defects of colonial society are most glaringly visible.

The squatters and managers have in general an easy time of it, no undue pressure being exerted on mind or body. As a rule, they have very little to do, though, of course, there are busy seasons when head and hand are fully engaged, either in actual work, or in overseeing the work of others. On some stations, where a large amount of stock is kept, the cattle are occasionally mustered, either for sale, or to take the tally, and brand the young beasts. Few things in the world can be more delightful than a rapid ride after stock in the fresh, bright morning air, which braces the nerves and muscles to their highest tension and sends the blood tingling through every vein. Sheep mustering is by no means so exciting. Sheep are stupid animals, and almost as obstinate as the traditional Irish pig. Merinos are fleet-footed, and, if they choose to scatter, would be very difficult indeed to handle. Fortunately they are gregarious, and keep together in herds or mobs, and so they are easily worked by means of dogs. With the shearing itself the masters and the regular station hands have nothing to do. It is under the control of professional shearers, who go from station to station, beginning at the north and working steadily southward. These men are paid per hundred for sheep they shear.

On the whole few things are more enjoyable than station life at its best—the free pure air, the out-door life, so much of which is spent on horseback, the freedom from conventional restraints, and above all the absence of small cares and worries which beset the business man and the farmer. True, for the run holder as for others, there are bad times, when the sheep are diseased and wool is low, but these evils are wholesale and fatal in their effects, and call for extreme powers of endurance, and for extreme remedies; but we all know and acknowledge that it is the small troubles, the petty daily cares which take the pleasure out of life, and reduce it to mere existence.

I do not think that ladies generally care much for station life. There is little to occupy and amuse them, save the mere drudgery of house work, feeding fowls and pigs, rearing chickens and ducklings, making butter, &c., no opportunity for social intercourse. Society, as I before said, is out of the question—people are too scattered, and too busy. Sometimes, in the summer, an excursion of a few days to a neighboring station or the nearest city, may be planned and carried into effect; but these expeditions are few and far between, and unless ladies possess many resources and accomplishments—being able to play and sing, sketch in pencil or water-color, ride, drive, and climb—and above all, unless they have a true love for the country, they must find this life exceedingly dull.

All along the seaboard, in the neighborhood of railways and near towns, the land is becoming far too valuable to permit of its remaining in an unproductive state; it is worth money, and must be made to yield money. In the back districts, where the land is less fertile and less accessible, a few large runs are still intact, and will probably remain so for many years; but they yield only a moderate percentage on the money invested in them, and station life, in its best and brightest aspect, must soon become a thing of the past.

MAGAZINES FOR SEPTEMBER.

THE AMERICAN NATURALIST—CONTENTS:—The Siphonophoros. (1.—The Anatomy and Development of Agalma.) Destruction of Obnoxious Insects by means of Fungoid Growths; List of the Birds of the Willamette Valley, Oregon; Do Flying Fish Fly? Editors' Table; Recent Literature; General Notes; Botany; Zoology; Anthropology; Geology and Paleontology; Geography and Travels; Microscopy; Scientific News.

"MIMICRY" IN SNAKES.—In the Naturalist for September, the question is asked, "Does the fox-snake 'mimic' the rattlesnake?" This recalls an experience of mine that occurred several years ago, when collecting plants in the vicinity of Panola, Miss. A snake of an unknown kind running along in the low grass was pursued to some rail that lay in a loose pile on the ground where it had fled for safety. By means of a stick of sufficient length, after finding it, I held it fast to the side of a rail, when I was surprised and startled by a buzzing sound from its tail. The first thought was that I had a rattlesnake, but a glance at the tail and the color of the skin at once disproved this. Feeling safe from being bitten, the hold was kept, and the phenomenon observed. The tail, vertically flattened either naturally or for the occasion, was thrown into rapid vibrations from side to side. The snake was very angry at being held, and I thought this its mode of showing its spite. The sound seemed hardly as acute as that made by the rattlesnake, but may have been somewhat modified on account of the beating of the tail against a rail, as it did from its position. It was, however, a close enough imitation to cause one, on hearing it, to get out of the way of harm. My description of the way of producing the sound would be in almost exactly the same terms as those used by Mr. King, though, if I remember rightly, it was more continuous, still it was not without interruptions. On loosing my hold to get a better chance to kill the snake, being uninjured it glided rapidly away, and escaped among the grass and bushes, and, as I was not in search of that kind of specimens, no further pursuit was made. I did not know the species, but from its slender form, dark color, and rapid running, should think it a Coluber, or one nearly allied to that genus. Its length was about five feet.—*E. F. Hill, in American Naturalist for September.*

PHRENOLOGICAL JOURNAL.—CONTENTS: Winfield Scott Hancock, Democratic Candidate for President of the United States. Portrait; Wm. H. English, Democratic Candidate for Vice-President. DISCOVERY OF GIANT REMAINS IN OHIO.—A correspondent of the Cincinnati Enquirer, in describing the mound in which the gigantic skeletons lately found in Muskingum County, Ohio, were deposited, says it was about 64 feet long and 35 feet wide, top measurement, and gently sloped down to the hill where it was situated. A number of stumps of trees were found on the slope, standing in two rows, and on the top of the mound were an oak and a hickory stump, all of which bore marks of great age. All the skeletons were found on a level with the hill, and about eight feet from the top of the mound. In one grave there were two skeletons—one male and one female. The female face was looking downward, the male being immediately over, with the face looking upward. The male skeleton measured nine feet in length, and the female eight feet. In another grave were also found two skeletons—male and female—with the female face looking upward and the male face looking downward. The male frame was nine feet four inches in length, and the female eight feet. In another grave was found a female skeleton, which was incased in a clay coffin, holding in her arms the frail skeleton of a child three feet and a half long, by the side of which was an image, which, upon being exposed to the atmosphere, crumbled rapidly. Seven others were found in single graves, and lying on their sides. The smallest of the seven was nine feet in length, and the largest ten. One single circumstance connected with this discovery was the fact that not a single tooth was found in either mouth, except in the one incased in the clay coffin.

On the south end of the mound was erected a stone altar, four feet and a half wide and 12 feet long, built on an earthen foundation nearly four feet high, having in the middle two large flagstones, upon which sacrifices were undoubtedly made, for upon them were found charred bones, cinders and ashes. This was covered by about three feet of earth. This excavation was made under the direction of the Muskingum County Historical Society, and the things alluded to in this letter, or dispatch, can be verified by a number of witnesses who were present and watched the work as it progressed. It was pursued with great interest and diligence, there being the strongest incentive to prosecute the investigation, for such remarkable developments in mound-opening are very rare, and are therefore fascinating in the extreme. Their future labors were also rewarded with additional developments, which, if they do not throw additional light upon this giant race of people that once inhabited this country, will at least stimulate research.

What is now a profound mystery, the result of this excavation may in time become the key to unlock still further mysteries that centuries ago were commonplace affairs, is a stone that was found resting against the head of the clay coffin above described. It is an irregular-shaped red sandstone, weighing about 18 pounds, being strongly impregnated with oxide of iron, and bearing upon one side two lines of hieroglyphics.—*Phrenological Journal for September.*

ECLECTIC MAGAZINE.—Contents:—Steel Engraving, Portrait of George Grote the Historian; Henry David Thoreau; His character and opinions, By R. L. Stevenson; Edgar Allan Poe. Microscopical Society; The New Jersey State Microscopical Society. Questions and Answers; Exchanges.

For Women.

CONDUCTED BY MISS RAY CLARK.

ARE ALL THE CHILDREN IN?

The darkness falls, the wind is high,
Dense black clouds fill the western sky,
The storm will soon begin;
The thunders roar, the lightnings flash,
I hear the great round rain drops dash—
Are all the children in?

They're coming softly to my side;
Their forms within my arms they hide—
No other arms are sure;
The storm may rage with fury wild,
With trusting faith each little child,
With mother feels secure.

But future days are drawing near—
They'll go from this warm shelter here,
Out in the world's wild din;
The rain will fall, the fierce winds blow,
I'll sit alone and long to know,
Are all the children in?

Will they have shelter then secure,
Where hearts are waiting strong and sure,
And love is true when tried?
Or, will they find a broken reed,
When strength of heart they so much need
To help them brave the tide?

He knows it all; His will is best,
To shield them now, and yield them rest,
In His most righteous hand;
Sometimes souls he loves are riven
By tempests wild, and thus are driven
Nearer the better land.

If He should call us on before
The children go, on that blessed shore,
Afar from care and sin,
I know that I shall watch and wait
Till He the Keeper of the Gate,
Let all the children in.

HOUSE-BUILDING—FAIRS.

IN answer to Mrs. B's. request for hints about house-building I send our experience.

We commenced at the beginning, for when we took possession of our farm, there was but one building upon it—a good barn.

Upon inspection a slight eminence at just the right distance from road and barn was found and chosen for our house site; then many a long Winter evening was pleasantly spent in drawing plans and making calculations for the building of our future home.

The family purse isn't a heavy one, and we were obliged to "look well before we leaped" for come what would we were resolved that no "mortgage" should be included in our plans. What we wanted was a house just large enough to *use*, no shut up rooms to be furnished for moths and spiders to abide in, but all to be airy and pleasant in Summer, and capable of being economically warmed in Winter. A good stone foundation and dry cellar were essential—and a bay window for plants—by some considered a luxury, we called also a necessity; and who can get along without a bath-room, neither did we forget a good, large pantry, and a closet for old clothes, boots and so on, near the back door for the greater convenience of the "men folks". Just here some one suggested that we should'nt have much money for our outward "adorning" if we had all these extra's, but we replied, Virginia creepers and bitter-sweet grow all along the by-way and we could get them to cover all we lacked in brackets, moldings, etc.

As we planned so we builded and the result is not a pretty house, neither is it the stereotyped "house with a wing" or "square house with a cupola," so common in our part of the country, but it is an odd-looking, but cozy cottage with its piazzas, even now, over-run by woodbine and clematis, bitter-sweet and trumpet-vine.

Our partitions are so placed that *even* breadths of carpet fit the rooms, thus obviating the difficulties of carpet laying.

In short, much thought and "contrivance" were expended on "our house," and we are well content, may Mrs. B. be equally as well suited.

May I ask a few questions about Fairs? What are Fairs for? are they for the promotion and encouragement of home industry? if so, why do the "Committee look at the *name* of the *exhibitor* before deciding as to the merits of the *exhibited*?

Why is it that foreign work purchased by one exhibitor competes with articles made by another exhibitor?

Why are not the rules forbidding re-exhibition of articles in certain classes, enforced?

Why are towns people generally selected as committee on domestic manufactures?

MILLY BIRD.

DON'T DO IT.

I READ an article of Miss Irene's in this department asking some married lady to give the men "Hail Columbia" because women were so overworked and broken down before their time. Now I'll do no such thing, for the simple reason that I think in the generality of cases it is woman's own fault, and at the risk of bringing all the "RURAL" sisters on my head, I must say that I think such is the fact.

Now in the name of "common sense" is it not just as easy to tell a husband in plain English that you didn't marry for a "slave" as it is to drudge along taking every additional burden without complaining, till at last the "straw" comes "that breaks the camel's back," and you are neatly folded away in the lap of Earth, while wife number two manages the aforesaid husband far better than you ever did, for the simple reason that she asserts "her rights," and maintains them too?

I tell you, ladies, I have never seen a man that liked a worn down, humble creature, who hardly dared say her soul was her own. Of course, when he wishes to be waited on, she comes "handy," but when he wants "society" he seeks it in some "club," or other questionable manner; whereas, if the wife had saved her health and strength, she might be his equal "physically" as well as his superior morally. There are very few men who are naturally unkind to women, but when girls marry, they become ambitious to do all they can, and take on every added burden, till nature staggers beneath the load. Had they stopped when they could not safely go further and demanded help, there is little doubt but that they would have received it.

What is the use of raking and scraping continually to amass wealth, and then lie down and die for some one else to enjoy it? That plan is altogether foreign to my ideas.

I love to be clean and as nice as anyone. Yet "don't you forget," I never intend to test my physical strength to such a degree that my life will be shortened by the exertion. If a woman don't take care of number one, no one else will do it for her. I've heard men lamenting over the days of their dear grandmothers and great grandmothers, when the women were all good, and plied the distaff and spinning wheel, and all such antediluvian curiosities, and then I wished in my heart that those same "croakers" were compelled to farm it as their dear old ancestors had done when they cut their wheat with a "grass hook," and ground their corn between heavy stones.

How would they like to do without their manifold "farm machinery," that lightens their burdens so much in this 19th century, but you see man is naturally a selfish being and needs to be told once in a while that women have "rights" just as well as he has.

I have often watched our farmers as they come to town on Saturday and see their wives, who, nearly all of them look jaded and worn out, while the burly farmer laughs and talks and looks hearty, and drives home with a $50 or $75 reaper or mower to make his work light while his wife is afraid to spend $5 without his lordships permission, but goes all over town lugging an overgrown baby to see where she can get calico the cheapest, while he lays back in some store, smoking and talking politics or debating whether Garfield or Hancock will win the day.

I tell you ladies the reform lies within ourselves, let us do our duty humbly, bravely, but when endurance ceases to be a virtue-rise up and assert your rights and my word for it, your husband will but respect and love you the more, when he sees that he married a "woman" and not a "slave." By way of digression, now that the season for tomatoes is here, I would tell the ladies that if they will take the large green ones and slice them thin like apples, roll them in corn meal and fry them in butter to a "golden brown" like fritters they will find them the most palatable dish they have ever eaten. MRS. M. J. G.

FEMININE ADORNMENTS.

WHAT inconsistent creatures we are. Most of our sex have the greatest abhorrence of creeping things, such as lizards, spiders, snakes and other abominations, and yet when fashion decrees that these repulsive reptiles shall be worn as articles of jewelry, we are the first to adopt the "new thing." Accordingly we have serpents of every material, gold, silver, coral and jet, twining their folds on our wrists; the same disagreeable creatures, as well as lizards, imitated in brass and other metals acting as brooches and clasps in our bonnets and hats; flies, beetles and other insects are worn as ear-ring, lockets and ornaments. Some ladies prefer to have their jewelry suggestive of feminine occupations. Hence we see a lady, evidently wishful to be taken for a housemaid, adorned with brooms hanging from her ears, and, for fastening her collar, buckets, grid-irons and dust pans are used for ornamental purposes. It bespeaks little artistic taste on the part of the ladies who adopt these useful but unlovely articles as adornments. Sure there are beautiful forms enough in nature—in leaves, flowers and grasses—which can be successfully imitated by the jeweler's art; and are more appropriate to grace the forms of women than the fashionable articles above mentioned.

A TIDY ROOM.—Do you ever observe that a tidy room is invariably a cheerful one? It is cheering to come into one's breakfast room and find it spotlessly tidy; but still more certainly will cheerfulness come if tidiness is the result of our own exertion; and so we counsel you, friend, if you are ever disheartened, vexed or worried about something that has gone wrong with you in the world, to have resort to the great refuge of tidiness. Don't sit brooding and bothering. Go to work and make everything tidy about you and you cannot fail to recover your cheerfulness.

TO RESTORE FADED UPHOLSTERY.—The following directions were given recently to a correspondent of the London Furniture Gazette; Beat the dust out of them thoroughly, and afterwards brush them; then apply to them a strong lather of Castile soap by means of a hard brush; wash the lather off with clear water, and afterward wash them them with alum water. When dry, the colors will be restored to their original freshness. When the colors have faded beyond recovery, they may be touched with a pencil dipped in water colors of a suitable shade, mixed with gum water.

IT must be that the ladies (God bless them!) are growing intelligent, for the shoe dealers say that the demand for lower heels and broader toes, is increasing. They have at last found out that high heels, narrow toes, corns and aching feet go together, and the way to avoid the two latter is to dispense with the two former, regardless of so-called "style."—Springfield Union.

FASHIONS.

PARASOL handles have been things of art this Summer, finished with knobs of painted porcelain, set with cats' eyes, lapis lazuli, coral and other semi-precious stones, and carved into heads, animals, and birds or insects of various kinds.

Walking skirts and the fashion of filling up the interior of the lower part of the dress skirts with a foundation plaiting has done away with the uncleanly extravagance of long-trained, white skirts. White skirts are hardly made now more than walking length, and are popularly finished with two or three ruffles tucked on the edge, and sometimes finished with needlework or lace.

With gray, brown and bronze dresses, and with all neutral shades, a deep red is the favorite color for trimmings; with dark blues and reddish browns and purples, old gold is the favorite shade. When the skirt is trimmed with flounces of the same material the fluting is put on just under the lower flounce upon the skirt itself.

A new caprice for trimming evening dresses of India mull is to press the brightest colored sea mosses until they are thoroughly dry, then arranging them upon the skirts, bertha and sleeves to resemble a vine, giving the effect of the most delicate hand-painting or embroidery. Small tufts of wood-moss, lichens, ground pine and small fern leaves are also used.

All gloves are less expensive than for many years. Cotton gloves come as elaborately made in open-work and silk stitching as the Lisle thread and are frequently imposed upon the ignorant by careless salesmen.

Lisle thread gloves are much more elastic, thinner, and when placed beside the cotton the difference is discernible. They are embroidered and plain, some of them are open-worked nearly to the elbow; others have elastic bands at the wrist.

The small bonnet is a favorite with many, but not a few prefer the larger style, which is trimmed now, not only outside, but inside also, with flowers. Strings are very wide, and often trimmed with lace.

It is difficult to say which will be the winner in the end; at present the most opposite shapes are patronized by fashion, and the one thing required of a bonnet is that it be becoming.

The bouquet, the place of which is constantly being changed, is, we understand, to be worn lower than ever—below the waist in front. But we doubt whether this innovation, in questionable taste, will ever be generally accepted. For the coiffure, one or two flowers—mostly roses or carnations—are fastened just behind the left ear.

Wrappings for the autumn and winter will be of various shapes, but there seems to me to be nothing new in this branch of fashion. There will be simultaneously worn large and long mantles, short jackets, very large visites, others very short, tight-fitting coats with extremely long basques, and numerous hoods. Every kind of garment that can accomodate itself to a hood will have one. As a transition from the light wraps of summer to those of autumn, the long or square India cashmere shawl is more and more generally adopted.

As a change from the casaquin and basque bodice, we now see a number of dresses made with a bodice which is a modification of the blouse. There is a plaid shoulder-piece or yoke; the full bodice is fastened on to this yoke in close shirrings in the middle of both the front and back. In front all the fullness is closely gathered in at the waist and confined under a round belt below which the bodice is continued into a plain basque. At the back the shirred middle piece, which is let in between the side seams, is continued over the skirt, and looped up into a limp puff, which terminates into a plaited lappel. The front part is trimmed with a scarf drapery, which is arranged below the basque, and the skirt is trimmed round the bottom with either one deep kilting or several rows of fluting. This can be done in any sort of fancy material, or in washing fabrics. If the latter, thread-lace edgings are very fashionable.

WHAT OTHERS SAY.

(Continued from page 642.)

The Report Furnished to the English Parliament by the Commissioners, Messrs. Read and Pell.

From the speeches delivered at various times by Messrs. Read and Pell touching their agricultural investigations while visiting this country, we have quoted all that could prove of especial interest to our readers. Much of this Report is merely a repetition of those speeches, and we now select from it only such portions as have not been referred to before:

"Few English farmers have any idea of the hard and constant work which falls to the lot of even well-to-do farmers in America. Save in the harvest, certainly no agricultural laborer in England expends anything like the same time and strength in his day's work.

MACHINERY.—The readiness with which the tillers of the soil take to machinery in America would surprise some of the farmers in the Old Country. The skill and ease with which they are worked say something for the manufacturer, but still more for the intelligence of the farmer. In America the presence of labor-saving machinery upon even a small farm is an absolute necessity. There is the further inducement to obtain implements of all kinds by buying them on long loans and by paying for them by installments, which sometimes tempts a farmer to buy more machinery than he can afford. The machines used upon the farms are well constructed and exceedingly light and handy. When one hears of the perishable nature of the American implements, it would appear that the chief fault rests with the farmer rather than the maker. We should say that good machinery and improved implements are much more common on American than English farms. The tools are certainly lighter, better shaped and better made.

EXHAUSTION OF THE SOIL.—Whenever the natural fertility of the virgin soil is exhausted, or indeed seriously impaired, and recuperative crops have to be introduced to repair the damage, then no doubt the expenses of growing wheat in the western prairies and the great river basins of America will be increased. That this exhaustion must come one day with continuous wheat growing, followed by burning the straw, is quite certain. But it cannot come immediately. The accumulated vegetable deposits of centuries, and the untold number of grass crops that burn or rot upon the prairies, are not to be exhausted in a few years. When wheat shows signs of flagging, the simple alternative of a crop of Indian corn seems sufficient to restore its fertility. And in northern latitudes, where maize cannot be grown, one year's clover plowed in suffices for another round of wheat crops. But the impoverished condition of some of the Eastern States, and the necessity of manuring and rotating the crops in others, plainly indicate that the fertility of the virgin soil, however great, is not inexhaustable.

THE CORN CROP.—Next in importance to the wheat crop, if indeed it does not claim first rank, comes corn. Slowly, but surely, it is thrusting the cultivation of the noble grain northward, and while wheat may be said to be now cultivated to the best advantage in the valleys of the Missouri, Mississippi and Ohio, with their affluents north of latitude 35 degrees, corn will be found as a main crop from the Gulf of Mexico to the shores of the great lakes, and extending from Texas and Kansas in the west to New Jersey, Carolina and Florida in the east. The cost of growing an acre in Iowa is given at about $5.50, and the cost per bushel, taking the yield at 40 bushels, at 13.825 cents. Another estimate gives the cost at $5.20—this is in Missouri, also on prairie land. Maize as a rotation crop answers the same end as root crops in England. The land is rested, cleaned and enriched by its introduction. There is no crop in which so little hazard is incurred as in this. With wheat the uncertainty is great; out of eighteen crops in Ohio six only were full crops, some were utterly destroyed by drought, but during the same period corn never failed, and the average yield was 35 bushels. The variations of price have been as marked as with other commodities, ranging within the last 10 years from 15 cents and 20 cents a bushel up to 50 cents, the average for the United States being 42 cents from 1871 to 1878. The yield, of course, varies with the quality of the land from 20 bushels up to 60 bushels an acre, the average from 1863 to 1878 being 26¾ bushels. In the river bottoms 60 bushels are exceeded. While the profit which the farmer derives in England by the growth of roots is an indirect one, and is estimated by taking into consideration the value of the manure which is left from their consumption by sheep or cattle, in America the profit is a direct one. Corn bought at 25 cents a bushel brings back 30 cents when given to hogs, if the latter sell even at as low a price as three cents a pound live weight. The annual growth of corn has of late years enormously increased. In 1868 there were nearly 35,000,000 acres planted, and in 1878, 51,500,000, but the money value per acre has been steadily declining. This increased abundance and cheapness have made it the object of a considerable and growing export trade, so much so that probably over six per cent. of the crop finds its way abroad.

BARLEY.—We saw and heard but little of the cultivation of barley. The few samples which we had an opportunity of examining on the farms of the United States were almost universally of a poor character, the grain being lean, irregular and parched. It is, however, remarkable that the Canadian barley finds its way into the United States in the face of a duty of 15 cents per bushel, and goes into consumption there in considerable quantities in the form of malt. The natural weight of the Canadian barley is lower than that of the Californian by several pounds per bushel. The growth of oats appears to be steadily increasing. In 1874 the acreage was nearly 11,000,000. In 1878 it exceeded 13,000,000.

POTATOES.—The acreage devoted to the growth of potatoes does not materially increase: it was 1,333,333 in 1874, and in 1878 it had only reached 1,750,000. The State of New York furnishes one-fifth of the whole area. The quality, except in the Southwestern States, was universally good. The average yield is not very large, being estimated at 88 bushels per acre, 60 pounds to the bushel.

AMERICAN OXEN.—Any one who has seen the splendid American oxen which are imported into this country, and the massive quarters of prime beef which find their way across the Atlantic, might be somewhat surprised and disappointed at the comparatively few really well-bred cattle that are to be found in the United States. There are, no doubt, in Kentucky and the surrounding States, thousands of beautiful, robust, pure-bred Shorthorns. But in the Eastern States the cattle are mostly ordinary dairy stock, descended from the common breeds of the early settlers, with only here and there a herd of really good cattle. In the South and West the Texan and other similar breeds predominate, the originals being no doubt imported from Spain. It is only the primest bullocks that are exported dead or alive to great Britain. The market here will not answer for any but the best beef, as the expenses of transit are almost as heavy upon an inferior as upon a really good beast.

Of the enormous crops of maize raised in the Middle States of America the quantity exported has never exceeded seven per cent. The rest must be consumed within the Union; a large portion of it close to the spot where it grew. By converting his maize into beef and pork the American farmer expects to receive double the value he could command for this corn. The manure from the stock so fed is esteemed of no value, and is generally regarded as a nuisance. The way of regarding it is altogether different from that of the English farmer, who, when he uses grain or other artificial food for his grazing animals, has invariably to look for a large portion of his return in the improved value of the manure thus produced.

FRESH MEAT TRANSPORTATION.—The admirable manner in which the transit of fresh meat is managed in America and on board the steamships now insures with almost perfect certainty its arrival in prime condition on these shores. All this seems to point to a greater development of the dead meat trade, and until some more stringent methods are enforced for the eradication of pleura-pneumonia in the United States, the unrestricted imports of live cattle into the interior of these islands cannot for the present be resumed with any safety. The American government seems now quite alive to the necessity of stamping out pleura-pneumonia and other contagious diseases. The fact that these disorders only exist in the Eastern States, and principally among the dairy stock of the great cities, proves pretty clearly that they are imported and are not of American origin. Nowhere in the Middle or Western do we find any traces of pleura-pneumonia, foot-and-mouth, and such-like contagious diseases. Whenever America can show a clean bill of cattle health, and live imports are again introduced, a considerable trade in store stock will probably be developed. The cost of transit of great numbers or store cattle need not be so heavy as it is now. More of such stock could go in the railroad trucks and in the ships' holds than is now allotted to fat animals.

HOGS AND BACON.—The pig in America has a happy time of it. He roams everywhere at pleasure; he is monarch of all he surveys. His freedom may be purchased at the expense of shelter, for covered pens are exceedingly rare, but the pig seems a much more hardy animal in the New World than in the Old. He makes the most of his advantages, and at a comparatively early age comes to a considerable weight. The average live weight of a pig killed in Winter is stated to be 280 pounds, in Summer it is 240 pounds. Twenty per cent. reduction from the live weight is supposed to give the average weight of the dead carcass. Nowhere can such grand herds of swine be seen as in the maize States of the Union. Save in the Indian Territory you may see a thousand pigs without finding a really bad one, and there can be no doubt that the swine stock of America is generally superior to that of England. The Berkshire is the most common breed; they come to early maturity, and have a large amount of lean meat in proportion to the fat. The other most popular breed is the Poland-China. These pigs fatten very readily and come to an enormous weight, but the pork is not equal in quality to that of the improved Berkshires. The rapidity with which hogs are slaughtered and dressed in the great curing houses of America is well known. All that need be said here is that the pig is seized by the hind leg, hauled aloft, stuck, bled to death, scalded, scraped, disemboweled, beheaded, halved and run into the chilled chamber in 10 to 15 minutes. The pig in America is not without some drawbacks. It is exposed to various diseases, the most fatal being hog cholera, or what is now termed in England swine fever. No cure is known for it, and no substantial reason has yet been assigned for its origin. It is highly contagious, and occasionally clears off all the pigs in the district. Its ravages in some regions are so extensive that farmers are compelled to give up keeping pigs for a time. The great danger which must result to our home stock from importing live pigs from any country where this fatal disease is so prevalent confirms the necessity of making the recent orders prohibiting such importations, for a time at least, permanent. The infinitesimal proportion of live pigs to the pork we receive from the other side of the Atlantic renders the prohibition of no consequence to the consumers of this country.

POULTRY.—Not much can be said in praise of the poultry of the United States, with the exception of the turkeys, which are generally good, and are raised without much difficulty. They do not, however, appear to reach the great weight of our English birds, being of a slighter form, approaching that of the wild stock. If it may be said of the Texan cattle that they are all "legs and horns," the American fowl may be described as all "legs and elbows," and when plucked presents, with its bright yellow skin, a most uninviting appearance. They are, too, restless and sprawling, and if food were not abundant and cheap, would for the table be unremunerative. They are, however, in request for a change from the perpetual repetition of tenderloin and fillet of beef, and the prices paid are somewhat high.

CONCLUSIONS.—The view we took of the agricultural affairs in the United States was of necessity a broad and general one, and only in some special matters were we able to go into particulars. We came to the conclusion, however, that, after all, America is no paradise; that in the contest for agricultural supremacy, while fresh unexhausted soil, a level surface and the absence of stones are highly favorable for the profitable use of modern machinery and the manufacture of grain by a scouring course of cropping, still drawbacks exist which tell in favor of the Old Country. They may be stated in a few words. Severe Winters, putting a stop to agricultural employment, dangerous droughts, injurious insects, and in the prairie land (in the absence of lakes) a short supply of good water. With regard to cattle, for the present the American stockman in the West is possessed of singular advantages; land for nothing, and abundance of it; in the East good markets for dairy and other produce, and in the Middle States excellent pastures of Blue Grass (*Poa pratensis*). The growth of this plant too is extending far beyond its old home of Kentucky, and is now being established to the west of the Missouri. Its success in this district opens fresh prospects to the grazer, who will in time bring the improved turf under the hoof of thoroughbred stock, or at least, of highly graded cattle. The Western country, however, is poorly watered for the better class of stock, which suffer if left short of this supply, and the struggle for water rights for native cattle, which suffer less from drought, threatens ere long to become a serious difficulty; the allotment of land and the termination of free range will tend to make cattle raising more costly, though, on the other hand, the increased consumption of the population as it advances toward the Western plains will enhance prices. We have referred to the important part the railroad fills in developing agricultural wealth in the United States. No effort is spared on the part of the people to thrust this right arm of civilization as far as it can be made to reach; with them it is not population first and the railroad to follow, but the latter first as a means to the former. With an intelligence quick to design and a spirit eager and daring to carry out these enterprises it is difficult to account for a dullness of apprehension which tolerates the continuance of a tariff so hurtful to foreign trade and domestic economy as in some measure to render the position of the English agriculturist more advantageous than that of the American.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

KEEPING SWEET POTATOES.

MARY BEAL MCLOUTH.

IF G. H. T., of Mass. does not wish to keep sweet potatoes on a very large scale, perhaps *our* plan would be practicable. In our former home we had a closet in the chamber, which was nearly surrounded by other rooms, and chanced to be over a stove in which there was a fire every day. We cut a hole through the floor, and put in a small tin thimble. This let the hot air up and kept the room sufficiently warm, and could be closed if *too* warm. The potatoes were dried thoroughly, then packed in a barrel or box with very dry sand—sand and potatoes alternately, barely letting the latter touch each other. Cover with sand, and after they have stood two weeks, finish with an old quilt or carpet to keep them from the air. They will wither after a while, so as not to be good for eating, but will keep until time to be put out in a hot-bed.

Rice.

Put three tablespoonfuls of rice in a baking-dish, fill it with milk and set in the oven where you are keeping a slow fire. If done at breakfast-time or an hour later, it will finish cooking nicely by the time your dinner is ready, if you do not need to make a great heat for that purpose. If meat is roasting, an hour and a half will cook the rice. It is a very palatable dish; you get all the richness of the milk, and can hardly persuade a novice that there are no eggs in your pudding.

Our children are fond of boiled rice, and we generally contrive to have some in Summer on washing days, using the water in which it is just boiled, strained and blued, as starch for all light calico dresses and linen aprons. It answers the purpose well. ANNIE L. JACK.

HOUSEHOLD HINTS.

Soft Crust.

I SHOULD like to add a few words to that interesting article on bread making in the RURAL of Aug. 31st. It is only to tell young housekeepers what to do with their bread after it is baked. How to have my bread crust soft and tender was a problem that puzzled me much in my first years of housekeeping, and it was not solved until after three or four years of trial. Lay one end of your bread cloth down smoothly, and as you take your loaves out of the oven, put them on the cloth in the same position in which they stood in the tins; then spread the other end of the cloth over them, and over that turn each tin over its own loaf. When you make your bread into loaves, do not have your tins more than two-thirds full, or else the tins will not fit over the loaves nicely after they are done.

Rye Bread.

Some one inquired about making rye bread. I sponge mine at night exactly as I do my wheat bread. In the morning, when it is light, I stir in rye flour until it is quite thick (do not knead it at all); put it in tins, and when it is light bake. Rye does not need as much yeast as wheat; if you get in too much, after it is cold the top crust will separate from the rest of the loaf.

Dried Crab Apples.

To those who live in that part of the West where apples are scarce, I would say, if you have crab apples dry them; they need no peeling, and for mince or dried fruit pies they are the best apples that can be used; they need no cider or anything of the kind.

Feather Cake.

One egg, one cup of sugar, one tablespoonful of butter, three-fourths of a cup of sour milk; one-half teaspoonful of saleratus, two cups of flour.

Gingerbread.

One cup sirup, two tablespoonfuls melted butter, one teaspoonful ginger; mix thoroughly together; one teaspoonful saleratus in one cup of boiling water; let it cool a few moments, then put all together, and stir in lightly three cups of flour.

Cookies.

One cup sugar, one cup sirup, three-fourth cup butter, one cup of sour milk, one large teaspoonful saleratus, some ginger and flour enough to roll out. Cut in squares.

Jelly not Hardening.

Can some one tell me what to do with my currant jelly? After resting in a sunny window for two or three days, it was nicely jellied. I set it on an upper pantry shelf, where I think it must have been too warm, for after several days, when I came to look at it, in tipping the glass I found a portion of it was in liquid form. Shall I boil it again? If anyone has had a similar experience, will she please respond at once, if she has a remedy.

Will some one tell me *just how* to make a good jelly cake to roll? I don't succeed in making it as nice as some I have eaten.

MRS. I. C. C.

DOMESTIC RECIPES.

Roast Oysters.

OPEN, leaving the oysters upon the lower shells, place in a large dripping-pan and set on the upper grate in a quick oven for 10 minutes. Take out, season with butter, pepper and salt and serve upon the shells.

Broiled Oysters.

Select large ones, wipe dry and broil upon a fine wire gridiron. By dredging with flour before broiling, a crust is formed which is liked by many. Sprinkle with salt and pepper, and drop a bit of butter upon each.

Oyster Soup.

One quart of *solid* oysters free from grit. Pour into a sauce-pan two quarts of boiling water; cream a large tablespoonful of flour with a half teacupful of butter, thicken the boiling water with the paste, season with pepper, boil up, add the oysters and cook until the edges curl. Have heated a teacupful of sweet cream or as rich milk as you can get, turn into the tureen, pour in the oysters and serve.

Oyster Pates.

A quart of solid oysters minced fine; a coffee-cupful of rich, new milk, seasoned with a tablespoonful of butter, pepper and salt to taste and thickened with a teaspoonful of corn-starch; some shapes of puff pastry baked in small tins. When the milk has boiled and thickened, add the minced oysters and simmer five minutes. Fill the shells with this mixture, set into the oven for two minutes and send to the table at once. MARY B.

Favre Beans.

Boil some white beans until quite dry and tender. Into a four quart baking dish put an inch layer of the beans, seasoned with pepper and salt, strew over minced bits of salt pork, cover with a layer of raw oysters, sprinkle with powdered cracker crumbs and bits of butter and cover with another layer of beans, thus alternating until the dish is almost full. The beans should make the last layer. Pour over a pint, or more if the beans were very dry, of oyster liquor, cover and bake half an hour, removing the cover toward the last that the top may brown. MAJOR.

News of the Week

HOME NEWS.

MONDAY, Sept. 20, 1880.

AN explosion occnrred on the 17th in a small wooden building occupied by the Union Metallic Cartridge Company at Brideport, Conn., as a fulminating building, and situated some distance west of their main factory. At the time of the explosion five persons were at work in the building, and all are supposed to have been killed, as none of them has been seen since, and four bodies have been found.....A cage with ten men started from the bottom of the shaft in the Imperial Mine at Virginia City, on the 17th and had been drawn up some 300 feet when the cable broke and the cage with the men was precipitated to the bottom and nine of them were killed The other was dangerously hurt .....At Guthrie, Ky., on the 15th, 200 men met and discussed the question whether they should visit Springfield and lynch the remaining negroes connected with the La Prade murder, but they afterward dispersed. The six prisoners were taken to Nashville the same night by the Sheriff of Robertson County and placed in jail for safe keeping, by order of Governor Marks

On the night of the 15th a mob of several hundred men and boys made an attack upon the Rink, a fine large, building, at Milwaukee, and razed it to the ground. The police did not interfere, and it was carted off piecemeal. The city has had trouble in getting the lessee to surrender his lease in order that an exhibition building might be built on the ground, which is owned by the city .....The trial of Virgil and Houston Gully at De Kalb, Miss , for the killing of Gilmer in connection with the Chisholm murder on the 16th resulted in a verdict of not guilty ..... The Board of Architects considering the practicability of erecting a new Congressional Library, or extending the quarters now occupied in the Capitol, have reported in favor of a separate building.... ....The bark Erinagh, from Port de Paix Hayti, was towed into New York on the 16th with yellow fever. Two men died from the disease on the passage.

Niagara has been thrown into a state of unusual excitement by a child-stealing case. It seems that a man named Sagar, who some years ago purchased a wife and two children from a citizen of Montreal for $1,600, after adding a third child to his family, grew tired of the woman he had bought and cleared out with the servant girl. The other day, taking a notion to possess his own child, he came to Niagara and carried it off, being followed to the other side of the line by the woman who had passed as Mrs. Sagar. However, she failed to find the child.

A man named Abram Clarke, engaged with a thrashing machine on the farm of Mr. Heist, of Pelham township, Canada, by some means got his hand entangled in the machinery, and in a moment the arm was literally torn from him. ..... Mr. James S. Mack, of Guelph, Canada, while driving through Mount Forest, Canada, accidentally ran over a child. The little fellow was almost unhurt, but Mr. Mack made inquiries about him and on learning that the poor child had neither father nor mother, he at once adopted him and brought him along. .....Ald. J. C. Wilson and Dr. R. A. Alloway, of Montreal, ran the rapids in a small-boat under the guidance of two Indians. When in the boiling waters and face to face with the peculiar dangers which surrounded them, they were greatly annoyed by myriads of flies, whose bite was quite as tormenting as that of the mosquito . . . . . Charles Carter was fatally injured on the 7th, in the chrysollie mine near Leadville, Col., by a premature discharge of giant powder, and William Brennan was badly mangled by an explosion of giant powder in the Laplatte mine .....Threatening weather is driving fishing and coasting vessels into the harbor of Gloucester, Mass , nineteen vessels bringing in 5,000 barrels of mackerel, and four others from the Banks of Newfoundland bringing in 211,000 pounds of codfish and 114,000 pounds of halibut.... ....Alexander Lebairn was the stage driver who was killed on the evening of the 6th, 16 miles from Fort Cummings, New Mexico. The two passengers killed were Isaac Roberts of New York, and E S. Madden, of Fort Bowie. The pursuing troops overtook the Indians on the afternoon of the 7th and had a short fight, in which one soldier and two Indian scouts were killed and two soldiers seriously wounded. The Indian casualties are not known.

The internal-revenue office has completed its analysis of the internal revenue for the last fiscal year, showing the sources whence it came. Illinois heads the list of States in respect of the amount of revenue paid to the Government, her total being in round numbers, $23,000,000, $19,500,000 of which were from spirits. Ohio comes next with a total of $18,000,000, of which $12,000,000 were from spirits and $3 000,000 for tobacco products. New York paid $16,000,000, of which $3,000,000 was for spirits, $7,700,000 for tobacco, and $4,300,000 for fermented liquors. The latter amount is four times greater than that reported from any other State in the same article. Virginia paid $5,700,000, all but $400,000 being for tobacco. Kentucky paid $8,800,000, all but $2,000,000 being upon spirits. Indiana paid $6,000,000, $5,500,000 being for spirits.

Cook county jail at Chicago incloses twenty murderers awaiting trial.....A diamond drill being run by the Lake Superior company at Ishpeming, Mich., has reached 415 feet in depth, and is passing through a bed of banded jasper.....Terrible ravages of small-pox are reported among the Canadian Indians of the Upper Gatineau district. .....The work on the Hudson River Tunnel, in which the corpses of twenty workmen are entombed, has reached such a state of progress that hopes are entertained of the dead bodies being recovered during the ensuing week..... Isaac Woodruff jumped from a bridge into thirty-five feet of water at Hadley, Mass., on the 5th and was drowned.....The boiler of a portable saw mill exploded on the 6th, near Vinton, Gallia county Ohio, killing Samuel Davis and James Donnelly.....At East Saginaw, Mich. Daniel Parkhurst was roasted to death at Johnson's lime kiln. He was pushing a stone that had formed a crust over the mouth of the kiln, when it gave way suddenly and carried him down, wedging him from the hips down. He was burned to death in ten minutes. His body was completelybaked....

Chicago is just now the scene of quite a sensational railroad war, the facts of which briefly stated, are, that the Western Indiana road had secured an injunction against the city interfering with the track laying, which was served on Mayor Harrison. When the track layers commenced work the police ordered them to desist, and, upon their refusal to do so, the mob was instigated to his work by the police. The railroad laborers were stoned by the mob, some receiving severe injuries. A fruitless call was made by the railroad men upon the Governor for the aid of the military, so the work was suspended, and on the 16th, Mayor Harrison and other officials were arrested upon an attachment for contempt of court .... ..Reports from the principal business centers of the country indicate an exceedingly favorable outlook for the fall trade in all departments.... ...A little boy five years old, the son of Charles Lymons, while picking acorns in the woods near Riverdale, Ont., was killed and partially eaten by a bear before assistance reached him..... ..For some months prospectors and prominent capitalists have been quietly prospecting on Battle mountain, in the Eagle river mining districts, thirty miles northwest of Leadville. Developments have shown such an amount of mineral in that locality that a road and telegraph are being pushed forward from Leadville, and miners and capitalists are now going to the new camp in large numbers. Carbonate ores promise, from the regularity of their veins, to yield an immediate and handsome addition to the silver production of the State. Smelters have been already started .....Sho imports at New York during August were the largest ever landed there in a single month, reaching $48,924 000, against $35,166,000 during August 1879. The exports for August reached $39,849,000, being over $5,000,000 more than during August, 1879..... Fourteen more survivors from the wreck of the steamship City of Vera Cruz are known to have been landed at Titusville, Florida.... .... Joseph Tapson, formerly secretary of the Metropolitan Railway Company's Provident Savings Bank of London, England, was arrested in Philadelphia on Saturday night on the charge of appropriating at different times during the past four or five years sums of money belonging to depositors of that institution, to the extent of$5,000.

Deputy United States Marshal Kyle has arrived at Fort Smith, Dak., with nine prisoners from Oklahoma, among them two Seminoles charged with murdering two white men, Bateman and Davis, in Chickasaw county, 200 miles west, in November, 1878. There were six full-blooded Seminoles engaged in the murder. Bateman was shot off his horse, and Davis met the same fate six miles from where Bateman was killed. The murderers have had no rest from the marshals since that moment. One, Billy Bowlegs, a son of the famous Florida Seminole war chief, shot himself through the heart, another was killed in a feud, and but two of the six are left. They live in a full-blooded Seminole settlement and the officers will soon have them The murderers found only $13 on the victims, which they divided.....Chief Big Road and 200 Sioux Indians, members of Sitting Bull's force, surrendered to the commanding officer at Fort Keogh, on the 8th inst. The remainder of Sitting Bull's forces are expected to surrender soon.....The Southern Pacific track has been going down at the rate of over 12,000 feet per day, and on one day no less than 12,800 feet, or 2 42-100 miles, were laid. It is intended to build the 200 miles intervening, August 24, between the end of track and El Paso in about 100 working days, or by Christmas. The rate at which this great line is being pushed across the desert is one of the wonders of the age.

There are said to be 10,000 buffaloes between the end of the Northern Pacific track and Deadwood. D. T, The Indians have driven them within the limits of civilization.....The Post-office department has ordered mail service on the recently completed railroad between Battle Mountain, Nev., a point on the line of the Central Pacific Railroad to Austin Mo., a distance of about 100 miles due south from Battle Mountain..... New Orleans received from foreign ports during the year ending September 1, 1880, 29,127,767 pounds of steel rails.....A large gang of men broke ground for the new Cape Cod ship canal, at Sandwich on the 15th.....Samuel Brannan, of California, who holds a large claim against the Mexican Government for moneys loaned and services rendered Juarez during the Maximilian invasion, will receive in settlement of his claim large tracts of wild land in the States of Sonora and Chihuhua, which he proposes to settle with American colonists.....A fire on Sunday morning destroyed a small house at Minneapolis, occupied by a cripple named Purdy and his wife, and both were burned to death.

[Chillicothe, (Ohio) Ross County Register.]

A Lady in the Matter.

That "woman's wit is often superior to man's wisdom," was convincingly proved in a circumstance that occurred in this city recently. It appears that Mr. Ludwig Schwarzler, a widely known grocer on Station Road, suffered with a very painful rheumatic headache to such a degree, that he was obliged to seek the aid of a physician. All medicines he used were of no avail. This induced Mrs. Schwarzler to buy St. Jacobs Oil. She procured a bottle for her husband With the second application he found relief. The pain left him, and he is as well as ever again. A remedy acting as promptly as this certainly deserves universal patronage.

FOREIGN.

The great question in Europe now is the Eastern problem—will there be war to force a settlement between Turkey on one side and Montenegro and Greece on the other? At present the outlook is decidedly belligerent. The treaty of Berlin which formally decided upon the results of the late Turko-Russian war, *recommended* the Porte to cede some of its territory to Montenegro and some to Greece without specifying precisely the territory to be ceded. Since then Turkey has done nothing definite in the matter, and a few months ago representatives of the Powers who signed the treaty of Berlin—Austria, Great Britain, France, Germany, Italy and Russia—met at the Prussian capital and specified the country Turkey was expected to cede, but again they failed to mention any penalty for the Sultan's refusal to comply with their decision. Turkey still procrastinated on the grounds that it would endanger the throne of the Sultan should he consent to hand over to Christians a section peopled by Mahommedans, and these formed a large proportion of the inhabitants of the territory to be ceded. Moreover, wherever the Christians had come into possession of land in which Mahommedans dwelt, after the late war, they had massacred or bitterly persecuted the latter, and it was too much to expect the head of the "Faithful" to hand more of them over to such Christian treatment. Then again, it couldn't be done without the use of force, and the Porte had no money to spend for that purpose. Montenegro's claim had to be settled first, and finally it was agreed that the cession of Dulcigno, a small port on the Adriatic, belonging to the province of Albania, together with a strip of the surrounding country, would be accepted by Montenegro as a full settlement of its demands. At first the Porte seemed willing to agree, but the Albanians, most of whom are Mahommedans, indignantly refused to allow a part of their territory to be given to their old foes, the Christian Montenegrins. The Turks have now withdrawn their troops from the town and tell the Montenegrins to take it; but 8,000 Albanians have garrisoned the place and defy their enemies to do so; and the latter are hardly powerful enough to capture the town. Meanwhile a large fleet, made up of some of the most powerful war vessels of the great Powers, has appeared before the place for the purpose of commencing that demonstration in Turkish waters which it is hoped will bring the Porte to "hear reason." The fleet could have shelled the town at once, but have deferred doing so until the Christians have had time to leave it. The Christian subjects of the Sultan, wherever numerous, threaten to rebel once the first shot is fired, and the Mahommedans mutter that, war once begun, they will massacre the Christians everywhere; so that just now the "Eastern Question" is once more likely to disturb the peace of Europe. War, no matter on how small a scale, once begun, it would be impossible, in the present armed condition of Europe, to predict when, where, or how it would end.

Land agitation and agrarian outrages still continue in Ireland. Parliament having adjourned and the gentlemen whose actions make "news," having gone hunting or on holiday trips, there is no English news of importance or general interest. In France, M. de Freycenet, head of the Cabinet, has resigned, owing to a disagrement between himself and M. Constans, Minister of Public Worship. Freycenet wishes the religious orders to be left in peace on their promising not to oppose the Republic; Constans, backed up by Gambetta and the extreme Republicans, wishes to force their expulsion Jesuit-fashion. Jules Ferry has been commissioned by President Grevy to form a new Cabinet. Stormy times ahead in France, most likely.

In Germany—Bismarck is still rusticating so there's little of interest being said or done. In Spain folks are mildly "fussing" over that new royal baby girl. In Italy, the trouble is, with a limited revenue, even from heavy taxation, to keep up a powerful army. In Afghanistan all is peace-like, and therefore furnishes no news. In South America, there's some squabbling between the State Government of Buenos Ayres and the General Government, on the Atlantic side, and on that of the Pacific one report makes Peru and Bolivia about to form a union,and another says that Chili has accepted the president of the United States as arbitrator between it and its enemies, Bolivia and Peru, while a third maintains the European ambassadors at Lima forbid the Chilians to attack that city, lest they should injure the property of European subjects there.

In a British peerage list appear 498 names, of which five date from the thirteenth century, five from the fourteenth, 11 from the fifteenth, 20 from the sixteenth, 67 from the seventeenth, 119 from the eighteenth, and 274 from the nineteenth..... ....Russia has 650,000 hereditary nobles and 380,000 whose titles expire with them.....While the population of the United Kingdom has increased since 1865 from 29,861,908 to 34,606,043, that of Ireland has decreased by more than a quarter of a million, and the number of marriages has decreased by 6,000. While pauperism has decreased in England and Wales from 971,000 to 837,000, and in Scotland from 121,000 to 97,000, the returns for Ireland show an increase from 68,000 to 100,000.... ....The railway from St. Petersburg to Simpheropol was watched night and day by 9,000 peasants and 40,000 troops during the Emperor's recent journey in Livadia.....Ten thousand English miners are annually injured by accidents, and 850 of these die. In Prussia the mortality is much higher, a life being sacrificed for every 70,451 tons of coal raised, while in England the proportion is only one in every 89,419.....The French revenue for 1880 is over $75,000,000 above the estimates.

A Gain of Eight Pounds in Forty-Five Days.

"About forty-five days ago," writes a gentleman from Mississippi, "I began the Oxygen Treatment, and as regards the effects of it, with a grateful heart I can say *that it has proved wonderfully efficacious; even surpassing my most sanguine expectations.* My lungs have been much developed, breathing capacity increased, and the cough, which was at times hard and laborous, has almost passed away. My general health has much improved—feel more life like and energetic, *having gained eight pounds in forty-five days.*" Our Treatise on "Compound Oxygen," which tells all about this remarkable remedy, is sent *free.* Address DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

AGRICULTURAL NEWS.

Statistics from Washington indicate that Louisiana has the largest average yield in value per acre of all the States, namely, $17.78; Arkansas comes next, $16.68; Texas next, $16.20, and Mississippi, $11.47.....The amount of butter now made in Iowa creameries is estimated at 50,000,000 pounds per annum.....The yield of this year's sugar crop in Cuba has been about 545,400 tons, against 630,000 tons last year.....In Southern Illinois apples are 10 cents a bushel, and do not find ready sale even at that price. Farmers cannot afford to pick them, and are turning hogs loose in their orchards .....The hay crop was deficient in the Atlantic States except in Maine and New Hampshire. In the States bordering on the Ohio River the average is higher than last year. West of the Mississippi River the average is low, on the Pacific Slope it is very high.....The United States Government has altogether spent $23,000,000 in surveying the public lands.....Texas is even now the "Empire State" in wool growth, both vegetable and animal. For 1880 the cotton crop is estimated at one million bales, while the sheep wool clip is the largest ever attained in the State.....The Government has disposed of over 8,000,000 acres of public lands during the last fiscal year.....A company has been formed for the manufacture and sale of rights to sell an invention of an Albany doctor for preserving provisions or bodies by means of water only.....The agricultural department reports the condition of crops as follows: The September estimate of this year gives a condition of 90 against 92 last year. This does not take into consideration the increase acreage. Potatoes show a decline within a month of eight per cent. The average is four per cent. less than last year. New York and Pennsylvania, which raise two-thirds of the whole crop, report an average of 93 against 98 last year.

THE Iowa State Fair to be held at Des Moines offers $16,296 in premiums.....In this State the crop of Humphrey hops has been nearly all picked during the week, the work having been rushed through from fear of mildew and lice. Mold has seriously injured hops in East and Mid Kent, England, and the crop, it is called, will be considerably short. Mold and the red spider have also damaged the crop on the European continent. But then it is more or less damaged everywhere every year. These two pests are threatening much damage hops in this State, and growers will probably harvest their hops earlier than usual to escape injury from them wholly or in part..... This year there is a decrease of 40,609 acres in the extent of land under cultivation in Ireland ..... One phase of Irish distress has been put on the stage in London, under the title of "Eviction."—*Dramatis personæ*: brutal landlord, myrmidons of the law, old peasant, stalwart son, lovely daughter, his Reverence, Jewish bailiff ..... Messrs. Reed and Pell, the Parliamentary Commissioners sent here to investigate American agriculture, have just published their report in which they are enthusiastic about agriculture in this country, especially in the West..... The Toledo, Delphos and Burlington Railroad Company has closed contracts for the extension of its road 250 miles, from Kokomo, Ind, to St. Louis.

As specimens of Irish land troubles here are some annals for a fortnight in August (1.) Twenty sheep at Ballyherne were clipped and their ears cut off. (2.) On Sunday a notice was found posted on thechapel gates, Clonegh, threatening death to any one taking farms from which another tenant had been evicted (3.) On Monday Mr. Mullingar was shot in the head (4,) On Sunday a heavy charge of No. 6. shot was discharged into Mr. Lysaght's room. (5). At Special Sessions, in Cork County, several farmers were brought up for assaulting Capt. Warren. (6.) Tuesday night's Dublin Gazette contains an offer of £200 reward for information respecting those who maliciously wounded bullocks, the property of Mr. Joyce, (Galway.) The list is by no means complete, and helps to explain how it is that property is now selling at 13 year's rental in Ireland against 25 to 30 in England. The victims in these cases bear thoroughly Irish names. Mullingar, Lysaght, and Joyce are "racy of the soil".....The trade in live cattle between this country and Europe, has increased to a remarkable extent. It is superseding that in dressed meats. The shipments last season were 105,327 head, and thus far this year 118,000 head. The amount of the trade in money is from $32,000,000 to $35,000,000 a year for the entire trade of the country. New York, Boston, Philadelphia, Baltimore, Portland and Montreal are ports of shipment ...Grain is being sent from Indiana to St Louis for export and the rates from St. Louis to Liverpool by way of New Orleans, are about the same as by rail from St. Louis to this city .....The Cook County, Illinois, Farmers' Alliance issues a call for a farmers' convention at Chicago on the 14th of October in the interest of cheaper freight rates. The Alliance hopes to secure the end in view through legislative enactment, to be brought about by the action of the proposed convention.

St. Julien, the "King of the Trotting Turf," wears forward shoes weighing eleven ounces and hind shoes weighing four ounces. He uses no toe-weights. In no race for the past eleven months has he made a single break, and as he has a

record of 2:11¼, which he is liable to beat, we think he may be pronounced the ideal American trotter.....In the Southern States the price of labor ranges from $12.25 to $7.32 per month. The average cost of subsisting a laborer in 1880 is $7.17 a month, against $7.14 in 1876.....A stalwart woman got employment in male attire as a farm hand at Hutchinson, Ill., but the farmer discharged her on learning her sex. She has brought a suit to recover wages for the whole contract....

"Made New Again."

R. V. PIERCE, M. D.:—I have used your Golden Medical Discovery and Pleasant Purgative Pellets, for the last three months and find myself—(what shall I say,) "*made new again,*" are the only words that express it. I was reduced to a skeleton, could not walk across the floor without fainting, could keep nothing in the shape of food on my stomach. Myself and friends had given up all hope, my immediate death seemed certain. I can never be too thankful to those who recommended your medicines, for I now live (to the surprise of every body) and am able to do my own work. I desire to make this statement in order that those suffering may not despair until they have given your remedies a trial. Yours resp'y, MRS. WM. RYCKMAN.
St. Catharines, Ont.

Facts for Dairymen.

It should be borne in mind by practical dairymen, that the Perfected Butter Color of Wells, Richardson & Co., Burlington, Vt., is the best obtainable in the world. It is absolutely pure and harmless, free from odor or flavor, cannot spoil in any weather, is in liquid form and ready for instant use, costs but little, and is of a uniform standard as to strength and intensity of hue. Use no other.

Thousands of ladies have found sudden relief from all their woes by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND, the great remedy for diseases peculiar to females. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets. Sold by all druggists.

You can save Doctor bills and keep your family always well with Hop Bitters.

Millions of bottles of BURNETT'S COCOAINE have been sold during the last twenty years, in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

CORN, yellow 57½c; do, extra yellow, 58c; high mixed, 57c; No. 2 mixed, 56@56½; steamer, 54½c. OATS, extra white ₩ bu. 46@49c; do, No. 1 white, new, 44½@45c; do, No. 2 do. 42½@43c. BUTTER, Northern—choice creamery, 29@31c ₩ lb; choice New York dairy, 27@28c; choice Vermont, 27@29c; fair to good, 23@25c; common, 18@20c. Western—choice creameries, 29@31c; fair to good, 26@28c; choice dairy-packed, 23@25c; choice ladle-packed, 20@23c; common, 17@20c. CHEESE.—Fine factory, N. Y. and Vt., 13c ₩ lb; fine factory, Ohio and West, 12½c; fair to good, 11 @ 12c; skims, 7@8c. EGGS—Eastern, 18@18½c ₩ doz; New York State, 18@18½c; Canadian, 18c; P. E. Island, 17½@18c; Western, 15@16½c; egg oats, 36c.

Chicago.—WHEAT active, firm and higher; No 2 Red Winter, 93½@94c; No. 2 Chicago Spring 93½c cash; 93½c. October; 92½c. November; No. 3 do., 83@83½c; Rejected, 65@70c. Corn fairly active and a shade higher at 40½c, cash; 40½c. October; 41½c., November. OATS strong and higher at 30½c@30½c cash; 30½c. September; 29½@29½c. October; 29½c November. RYE easy at 84½c. Barley easy at 74c. PORK—Options higher and cash lower at $17 50@17 75 cash; $17 75, September; $17-65@17 70, October; $13 bid, November. Lard steady at $7 82½ cash; $7 85@$7 87½. BUTTER Choice to fancy creamery 25@26c. per lb; fair to good do 22@24c; fine to fancy dairy 21@22c; good to choice do 18@20c, medium to fair do. In shipping lots 16@17c.; good to choice ladle packed 17@19¢; fair to good packing stock 14@17c; grease butter 8@10c. CHEESE. Fine cheddar creams firm at 13@13½c per lb for August makes to 12@12½c. for good to best July stock while the heated or damaged lots were bringing 11c@11½c; flat shapes were quoted from 11c for good fair stock to 12c for fine, while the poorer lots are being worked off at 9@10c, as to condition CIDER of slow sale. Fresh juice is quotable at $1-25@1.50 per half barrel. SEEDS: Clover $4.90 for prime. Timothy $2 20@3 25 for good to high prime. Flax was better at $1 22 for cash or a basis of pure to selling at $1 21 for October delivery. WOOL the asking rates from store Iowa, Wisconsin, and Illinois wool range as follows Tub-washed bright 46@48c per lb; do. dingy and coarse at 41@43c; fleece washed medium 40@42c; do, fine 36@38c; do, coarse 33@36c; unwashed medium 28@32c; do, coarse 30@25c; do, fine bright 25@26c; do, heavy 18@24c; bucks' fleeces 16@18c. Consignments from western Iowa, Nebraska, and Kansas sell about 2c. per lb less than this range, and burry and poor conditioned at 3@5c. less. Colorado wool (unassorted) is quoted at 25@28c per pound for medium to fine; 19@25c for coarse to medium, and black at 21@23c.

Cincinnati.—WHEAT,—No. 1 Winter red and white sells at $1, No. 2 do, at 96@98c. and prime mixed by sample at 65@96c. on track and in sacks on landing. Good to prime Amber sells at 93@95c, and choice ranges up to 97c. Inferior ranges down to 82c. During the week there has been an advance of from 3c. to 5c mainly owing to the demand by country millers. CORN—Yellow is scarce and nominal. White sells at 45@46c. Ear Corn is in light supply, and sells at 47@48c. on track, but the demand for it is only moderate. OATS—No. 2 white 34½@35c. No. 2 mixed 33@34c., and rejected at 32c. on track. Small lots from store sell at a little above these figures. RYE—In good demand and has advanced 4@5c. with sales of No. 2 at 93c. in elevator, but the demand is only moderate at this price. BARLEY—No. 2 Fall sells at 92c., and some choice has sold as high as $1, but the bulk of the sales are by sample at 75@85c. Inferior ranges down to 67c. No. 2 Spring sells at 85@88c., and some choice at 95c., but inferior ranges down to 63c. BUTTER—Fancy Creamery sells at 32c., and prime at 30@31c., choice Dairy at 25@26, choice Western Reserve at 23@25c., prime to choice Central Ohio at 20@22c., and common at 15@18c. ₩ lb. CHEESE—Prime to choice factory at 12½@13½c. ₩ lb., mild cheese bringing $13@13½c.

St. Louis.—WHEAT—No. 2 Red Fall, 92¾@92¾c, cash; 92¾c., September; 93c@93¾c. October; 94¾@95½c, November; 96@96½. December; 92¾@92¾c., all the year; No. 3 do., 87@88¾c.; No. 4 do., 84@85c. CORN—38¾@38¾c, cash; 38½@38½c., October; 37¾@38c, December. OATS stronger at 28¾c, cash; 28½c. October; 28¾c., November. RYE strong at 85c, bid BARLEY—medium to prime, 80@90c.; choice to fancy, 92½c@$1. BUTTER—Creamery—held over stock dull at 22c., choice fresh 27@28c. Dairy—Selections 24@25c. good to choice 18@22c., low to fair medium. 11@16c, common 12@13, country (poor) 10@12c., sweet yellow 14@18—top for single pkgs. WOOL—Tub-washed—choice at 41@42½c, No. 2 medium at 38@40c., dingy and low, 35@37c.; lamb at 33@35c.; unwashed—choice mixed combing, 27@28c, coarse do, 23@25c, choice medium, 25@26c., low do., 22@23c., light fine merino 21@22c., heavy fine merino, 15@17c. Burry, black, cotted, etc, from 5 to 15c. ₩ lb less. Southern burry sells at 12½@13c. GRASS SEEDS—Timothy firm and ready sale at $2.20@2.25. Nothing done in other seeds—Clover sold last at $4.92½@$5.

Robust and blooming health in Hop Bitters, and no family can afford to be without them.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 18 1880.

BEANS AND PEAS.—Old marrow beans have a steady demand. New medium have sold at $1 60; white kidney and pea almost nominal; red kidney very dull and tending lower. Green peas neglected at $1 50@1.60 the latter for new; bugs hurt the sale of old. Southern B. E. peas open $2.75@3 ₩ 2-bu bag. Marrow beans, prime, $1.65@1.67; other, $1.50@1.60; mediums, prime, $1.45@1.47; other, $1.35@1.40; pea, $1.50@1.65; white kidney, $1.70@1.80; red kidney, prime, $1.45, other, $1.30@1.40.

BEESWAX.—Demand is slack while offerings are full and prices easy; quoted 23@24½c. for Western and Southern.
Exports for week, 900 lbs.

BUTTER.—There has been a steady, sharp call for butter, particularly for upper grades of State and a good advance has attended it. Prices for fine are beyond export limit, though for that matter there has been little to spare from local wants. It is estimated that about 70,000 of New York's population are away during vacation season; as these have largely returned and belong to best consumers, the increased call is made apparent. A contemporary pleasantly remarks:—"At this part of the season dealers are always more or less puzzled in trying to suit the fastidious taste of high-priced consumers. Many of the latter have only just returned from rural points where their daily table supplies have been fresh, rich and rosy, and until their taste for what they call 'farmers' butter' wears off retailers will be kept busy in searching for the standard." A few rolls of State dairies quoted 27@28c. Western of fine quality is scarce, but all useful invoices sympathize with the strong quotations of State. Small dairies will soon be wanted for the single package trade.
Creamery, fine State, 31@33c.; fine Western, 30@31c.; all good to prime, 28@29c.; fair to good, 27@28c.; poor to fair, 25@27c. sweet cream, 27@30c.; State dairies, 24@27½c; pails and half tubs, choice, 28c.; good to prime, 26@27c.; poor to fair, 22@25c.; Welsh tubs, choice 27@28c.; other, 22@25c.; Western imitation creamery, 18@24c.; dairy, fresh, 23@24c; other, 16@22c.; factory, fine June, 20c.; present make, 16½@18c poor, 15c.
An official attempt is promised; to prevent the exclusion of oleomargarine in the export of butter from this port.
Receipts for week, 27,415 pkgs.; exports do., 12,861 pkgs.

CHEESE.—The receipts have been small and the market has held along very steady, showing a moderate amount of trade only, with the exports for the week, 28,700 boxes. Quotations are for
State factory, fancy, at 12¾c.; do. good to prime, 12@12¼c.; do. fair to good, 11@12c.; do. half skimmed, 9¾@10¾c.; Wisconsin factory, fine, 12¼@12½c., do. good to prime, 11½@12¼c.; do. fair to good, 10¾@11¾c.; Ohio factory, fine, 11¾@12¼c.; do. good to prime, 11@11½c.; do. flat, fair to good, 10@10¾c.; do. poor to fair 9@10c.
Receipts for week, 12,040 boxes; do. last week, 40,-312
Exports, 26,750 do.
Liverpool cable, 61s.
Steam, Liverpool, 37s. 6d.@45s.

COTTON—Has been active and excited, closing strong at for September, 11.70@11.72c.; October, 11.22c; November, 11.04@11.05c.; December, 11.08@11.09c.; January, 11.15@11.19c.; February, 11.32@11.34c.; March, 11.48@11.49c; April, 11.63@11.64.
Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples have little attention, with prices unchanged. Peaches are quiet. Small fruits have a good demand.
Apples—Old State at 5¾@6½c, new Tennessee at 3½@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6¾c.; evaporated, ring cut, at 8½@9½c. Old peeled peaches at 8@11c. Blackberries at 8c.; Raspberries at 25@26c. Pitted cherries at 19@20c. Whortleberries at 11c. New Georgia peeled peaches at 16@17c.; new North Carolina peeled peaches at 13@10c.; new unpeeled peaches, quarters at 7½c. new unpeeled peaches, halves at 8c.
Exports for week, 1,050 pkgs. of apples.

EGGS.—Receipts for week, 7 160 bbls.; do last week, 7,727 do. Moderate supplies have retained strong prices and the market closes firm with stock well sold up.
Near points, 20@21c.; State and Pa. 19½@20c.; Western and Canadian fresh, 19c.; second quality, 17@18½c.

FLOUR.—Trade is more active and prices stronger.
Latest prices are: $3.25@4.10 for inferior to very fancy superfine state and Western; $3 85@4.10 for poor to choice extra State and Western, odd lots and lines; $4.15@4 30 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4.65@5.50; good to choice do. at $5.60@6.00; (very choice to fancy do. at $6.10@6.35.) red and amber winter wheat inferior to choice trade and family at $4.25@5.85; round hoop Ohio, $4 20@4.65; and trade and family brands of do. at $4.70@5.35; St. Louis at $4.65@5.40 for inferior to good extra; $5 25@5.85 for good to choice (and $5.40@6.25 for very choice to fancy brands); Minnesota clear, inferior to fancy at $3.90@6.25; Minnesota "straight," poor to fancy, at $5 75@7.25, and patent inferior to very fancy at $5.75@8.50; unsound stock at from $3.25@4 85; city mill extra at $5.00@6.25 for fair to very choice for the West Indies; do. for England, $3.85@4.25 for poor to choice spring wheat, and $4.40@5.00 for winter wheat product; do. trade and family extras, $5.25@6.50; do for South America, $5.25@5.65.; No. 2 at $2.25@3.40 for poor to very fancy.
Receipts for week, flour, bbls. 104,100; cornmeal, do. 4,200; wheat, bush. 1,110,625; corn, do. 1,559,400; oats do. 251,450; rye, do. 71,500; malt, do. 48,400; barley, do. 2,800; beans, do., 1,400; rice, pkgs. 1,575.
Exports for week, flour 64,400 bbls.; corn meal, 3,900 bbls.; wheat, 1,074,700 bush.; corn, 1,761,025 bush.; oats, 4,900 bush.; peas, 8,660 bush.; rice 750 pkgs.

CORN MEAL.—Sales at $2.50@2.75 for yellow Western, and $3.20@3.35 for Brandywine.

FRESH FRUITS.—Heavy Fall shipments of apples to Europe continue a feature, but prices are low enough to do almost anything in an experimental way. A very heavy crop is assured from sections. Exports for the week, 14,000 bbls. or about 40,000 since the season opened.
Fall pippins and greenings 75c@$1 bbl. King $1.50@1.75c; Alexander, $1.75@2; Detroit Red, Twenty Oz,, and Malden's Blush, $1.50; Gravenstein, $1.50@2; N. J. Baldwins $1; The crop of Florida oranges was fortunately uninjured by the recent severe Southern storms. It is estimated that 300,000 half-bbl. cases will be packed this season. This yield is remarkable when it is remembered that in 1877 the crop did not exceed 2,500 pkgs. Pears are improving in sale as peaches run out. Bartletts are scarce and bring $10@12 ₩ bbl; Duchess, Beurre d'Anjou, B. Clairgeau, B. Bosco Louise bon $5@6; B. Diel $4.50@5; Swan's Orange $4.50@5.50; Sickle choice $8@10; other $4@6; cooking $2@3. Peaches show only ends of Northern orchards; prime to extra $1@1.75 culls, 60@70c. per basket. Plums are reduced to few and small packages. German prunes, per half bu. basket $1.50@1.75; Damson ₩ crate, $1@1.25; Reine Claude and Copper, $1.50@1 75. Quinces $5.50@6 for State apple. Peanuts arrive freely; late low prices brought out a speculative demand; sales for consumption only moderate. Va. 5¼@5½c.; extra prime, 4½c.; good to prime, 4@4¼c.; shelled, 5¾@5¾c. Chestnuts will be a big crop from received accounts a few quoted $7@8 per bu. Grapes have been scarce latterly but there are plenty to come. Delawares, cases of 18 3-lb boxes $4; bulk and basket per lb., 7@10c.; Catawbas, 6@7c.; Concords, cases 18 3lb boxes $3; in bulk, 3@4c.; Isabella 3c. Salem 5@6c. Cranberries have a little shipping demand; Cape Cod ₩ bbl., $5.50@7.50; N. J. per crate $1@2. Watermelons range at $100@ 25 ₩ 100; crop all here. Nutmeg melons 50c.@$1 50 ₩ bbl. quality variable.

GRAIN.—Wheat has been active; the exports for the week are 1,300,000 bushels; prices are firm.
Latest sales are for No. 1 white at $1.08@1.08¼; do. September, at $1.07¾; do. October; at $1.07@1.07½; do. November at $1.07¾@1.07¾; do. steamer grade at $1.06¾@1.07¾; No. 2 white at $1.06@1.06¾; ungraded white at $1.01@1.08; mixed Winter at $1.05; No. 2 red at $1.07@1.07¾; do. September, at $1.07¾@1.08¾; do., October, at 1.07¾@1.08¾; do. November, at $1.08¼@1.08¾; No. 3 red at $1.04@1.04½; ungraded red at 92¾c.@$1.08¾; No. 2 Milwaukee spring old crop, at $1.05¾. Rye is active and quoted 97@98c. for prime State, and 95@96c. for Western. Corn is weak and fairly active; sales of New York No. 2, regular inspection, at 50¾@51¾c.; do., September, at 51c.; do. October, at 51¾@52c.; do., November, at 53¾@53¾c; ungraded mixed Western at 50¾@51¾c. Oats are in liberal demand and show an advance: latest sales are of No. 1 white at 45@50c.; New York No. 2 white at 48@49c.; No. 3 white at 47@48c.; New York No. 1, 48¾c.; No. 3 at 47¾@48c.; do., September quoted at 43¾@43c.; do., October, at 38¾@38½c.; do., November at 38½c. No. 3 at 44@48c.; ungraded White Western at 45@50c.; ungraded mixed Western at 45@48c.; white State at 50@51c.; No. 2 Chicago at 48c. bid.

HAY AND STRAW.—Receipts are moderate, demand good and prices strong.
Shipping hay quoted at 80c.; medium to prime do., 90c.@$1.15; salt hay at 60@65c.; clover do. at 65@75c. Straw at 90@95c. for long rye; 65@70c. for short rye; and 60@70c. for oat.
Exports for week 1,122 bales.

HONEY.—Arrivals are quite free, but the weather thus far prevents much exposure and buyers are few. White clover, single comb 13c.; larger pkgs. do. 15@16c.; buckwheat 12@16c.; extracted 8@11c. dark to white.

HOPS.—Offerings of choice stock are small, and prices of this grade therefore about nominal. Other qualities are more freely offered and sales easy in price. Quotations are for

	Cents per lb.
New Yorks, crop 1880, medium to choice	27 @30
New Yorks, crop 1880, low to fair	25 @26
Eastern, crop 1880	25 @30
Wisconsin, crop 1880	25 @30
Yearlings, crop 1879, choice	23 @26
Olds, all growths	4 @14
Pacific Coast, new	none.
Pacific Coast, olds	nominal.

OIL CAKE.—Western is quoted $29@29.50. ₩ ton.

POULTRY AND GAME.—Dressed poultry has declined 1@2c. since Tuesday, and is henceforward likely to show the easy ruling figures of an advancing season.
Turkeys, choice, ₩ lb., 14@14½c.; fair to good, 12@13c; Phila., dry-picked, 14@15½c. Chickens, do., 17@19c.; Bucks Co. do 16@17c., State scalded, 14@15c.; Western, scalded, 13@14c Fowls, Phila., dry-picked, 15@16c.; N. J. d. p., 14@15c.; scalded 14@15c.; State, d.-p. 14@15c.; State, scalded, 14@15c; Western, scalded, 13@14c; poor, 11@12c. Ducks, Spring d.-p., 13@16c.; mixed 12@14c. Squabs, white, ₩ doz., $2.25@2.50; dark, $1.25@1.50.
The rush of Jewish trade has subsided and the market for live poultry has to take ordinary market chances. At the close the tone is easy.
Chickens, N. J., 13c.; Western 10@11½c.; Southern, 10@11½c. Fowls, N. J., 13@14c.; Western, 13@13c.; Southern, 12@13c. Roosters, 6@7c.; turkeys, old, 12@13c.; young 10@12c.; ducks, choice, 70c@$1; other, 50@60c.; geese, choice $1.75@2; other, $1.00@1.50; pigeons, 20@30c. The low rates for chickens is mainly on account of very poor quality.
The list is large but the weather is too warm for showing game and by this fact sales of course are restricted.
Wild ducks mallard prime 67@75c.; teal 40@50, common 20@30c. Partridge, prime, ₩ pair, $1 25; soft, 50@75c.; grouse, $1.25; woodcock, $1@1 25.. Eng. snipe, ₩ doz., $2; Sand snipe, 40@50c.; grass plover, $2.50; plover, $2, wild pigeons flight $1-25; venison short saddle 18@20c.; whole deer, 10@12c.

PROVISIONS.—Hog products have been more freely offered and have tended lower.
Mess pork quoted at $15.10@15.15 for Sept. and Oct., and $13. 5@3.25 for Nov. deliveries. Bacon at 8.75c. for long clear, and 9¼c. for short clear. Beef—extra India mess quoted at $18@20 for city; $10 for extra mess and $9 50 for plain mess; $10.50@11 for packet, and $11.50@12 for family mess, Beef hams at $17.50@18. Lard—Western steam at 8.17½c. for spot lots; 8.12½@8.15c. for Sept. and Oct; 8-10 for November. Steamine at 8½ for prime..
Receipts for week, beef, 325 pkgs.; pork, 1,050 bbls.; cut meats, 31,167 pkgs.; lard, 15 250 pkgs.
Exports for week, beef, 1,169 pkgs.; pork, 1,015 bbls.; cutmeats 9,323,253 lbs.; lard, 6,154,900 lbs.

SEED.—Clover is quiet, quoted at 8¼@8¾c. Timothy is dull at $2.40@2.50.
Receipts for week, 2,900 bushels.

TOBACCO.—Export demand is good and trade from manufacturers very fair, with prices strong.

VEGETABLES.—Exports of potatoes for week, 8,182 bbls.; of onions, 35 do. There is a good export demand for common grades of potatoes. Rose have a fair sale, but the market indicates some weakness, in view of larger receipts. Good crops and quality are reported in prominent raising points. E. Rose, $1.60@1.75 per bbl.; peerless, $1@1.25; culls, 50@60c. Sweet potatoes quiet, but prime are firm. Del. River $2.50@3.00; N. J., $2.15@2.50; Va., $2.25@2.50. Cabbage is unusually low. Tomatoes are steady. Corn active; late crop turning out well.
Green corn, ₩ 100, 75c.@$1.00; tomatoes, ₩ bush., 25@35c.; cucumber pickles, per 1,000 $1.50@1 75; egg plant, per bbl., $1.00@$1.50; Lima beans, per bag, 20c.@$1; shelled, per bush. $2.50@3.00; turnips, 100 bunches, 50@75c.; Russia turnips ₩ bbl, 50c.@$1.00; beets, 100 bunches, $1 00@1.50; bullnose peppers, ₩ bag, 75c.; cabbage, flat Dutch, ₩ 100 $2@4; red do., $3@5; marrow squash, ₩ bbl. 50@62c.; onions, white, $3.50@4.00 yellow, $3.00@3 25; red, $2.75@3 00; carrots, ₩ 100 bunches, $1.50@2.00; pumpkins, ₩ 100 $2 50@5; okra, per 100, 15c.; cauliflowers, ₩ bbl., $2@4.

WOOL.—There is a moderate degree of activity only and prices unsettled and easy. Quotations are for
Ohio, Penn., and W. Va. XXX 46@48c.; XX, 43@45c.; X, 43@45c.; No. 1 16@48c., No. 3 42@44c.; coarse 35@38c, combing 43@46c.
N. Y. Mich. and Wis. XX 38@41c.; X 38@40c.; No. 1 44@47c.; No. 2 38@42c; coarse 33@35c.; combing 42@46c.
Ind., Ky. and Tenn. XX 38@41c., X 38@40c.; No. 1 44@46c.; No. 2 38@42c; coarse 33@36c.; combing 42@46c.; combing unwashed 30@37c.
Ill. Iowa, and Minn. X and XX 36@40c.; No. 1 43@45c.; No. 2 37@41c.; coarse, 30@34c.
Ga., Ala., Miss and La. fine unwashed 33@35c.; medium unwashed 30@31c.; coarse unwashed 25@30c.; burry 14@20c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Sept. 18, 1880.

BEEVES.—Receipts for the week 11,542 head; do. last week, 13,461 do. The market was thinly supplied early in the week, and the heavy offering of yesterday gave butchers an opportunity to dictate their price views. Compared with Wednesday native good stock sold $1.00 per head or ½c. per lb. lower. Common grades, including Texas and Colorado, ½@¾c. do. Many droves were put on the scales which is an indication of the apathy of butchers. The weakness is in some degree attributable to a low wholesale dressed beef market, and it is thought its influence will be felt to Monday's sales. Quotations:—Texans and Coloradoes, 7@8½c., to dress 55 lbs.; common to fair native steers, 8@9¼c.; to dress 55@56 lbs.; good to choice, 9¼@10¾c., to dress 57 lbs.

COWS AND CALVES.—Supplies are largely from Maryland and Virginia. Market firm for good stock. The range is $30 to 60 per head the latter not in a wholesale or car-load way. For common or low quality there is no sale.

VEAL CALVES.—Supplies have been more liberal, and the market is easier than at our last. Dressed begin to arrive, quoted in good order at 8@10c It is rather early for them, as cool nights and mornings hardly offset the possible damage of a hot day.
Live calves, Bucks Co. and N. J., fed 6½@7c., State choice, 5½@6½c.; poor, 4@5c.; Mt. Holly, heavy to light, 5¾@6¾c.; buttermilk, 2½@3c.; grassers 2@2½c.

SHEEP AND LAMBS.—Receipts for week, 40,012 head; do last week, 30,802 do. The sheep market has been well supported, regardless of the large receipts. Quoted at the close 4@5¾c. poor to prime sheep; selected wethers, $5.50 per 100 lbs.; lambs quiet, only choice selling; New Jersey, 6½@6¾c.

SWINE.—Receipts for the week, 19,639 head; do. last week, 21,429 do. Market strong for fair to prime at 5¾@5¾. City dressed, 7¾@7¾c., with good demand.

Reading for the Young.

RAIN ON THE FARM.

My dear little children
  Stand up in a row;
And just let us see, now,
  Does any one know,
How the little round drops
  Of warm Summer rain,
Spatter and hop,
  And spatter again,
While little pug noses
  Press close to the pane;
And rollicksome toes-es
  Can hardly refrain
From an out-of-door play,
  In the dribbling charm,
When the rain comes pattering
  Down on the farm?

It turns up the litt'e
  White leaves on the trees,
That dance so, and flutter
  About in the breeze;
And hits the red berries
  That hide from the sun;
And dabbles the cherries,
  That swing one by one
High up when the birdies,
  Their dessert have done.
It colors the mosses
  A livelier green
It nods and it tosses
  The daises between,
And it sends the wee chicks
  To lie cuddled and warm,
When the rain comes pattering,
  Down on the farm.—MAUDE MEREDITH

IN-DOOR GARDENING—NO. 1.

MAUDE MEREDITH.

UPON the hills I see the golden brown,
  And in the valleys lie the Summer's red
The pastures bare and sloping grain-fields dun,
  All seem to whisper us, that "Summer's dead."

The purple grapes hang heavy by the river side,
  The flower borders turning dead and sere,
The rustling leaves beneath the arbor trees
  All whisper low that "Winter's reign is near."

THERE are few things pleasanter or more cheering during the dreary Winter season out-doors, than the green or blooming plants inside the comfortable home, and while every well-regulated household may have a part of the interest in the beauty of the Summer flower garden transferred to the sitting room or parlor for the Winter, I will give a few hints to the Horticultural Club in the transfer of the beauty of Summer out-doors to the beauty of Winter in-doors.

Now that the seed pods hang heavy and brown in the borders and the woodbine flaunts scarlet banners on the arches, whispering us of the near approach of that enemy of our flower beds, "Jack Frost," we must needs bestir ourselves if we would save our treasures from the touch of his blighting hand; window boxes must be retouched with varnish, flower-pots, last Spring discarded, again brought out, and all the new designs or inventions for making them attractive, added. Then comes the task of selecting. Not all the Summer favorites can find accommodation in the windows, and it requires considerable care and forethought to select only the best, those that will make the best show as Winter bloomers, or what is almost as good, by their bright or graceful foliage make the beholder forget the lack of bloom.

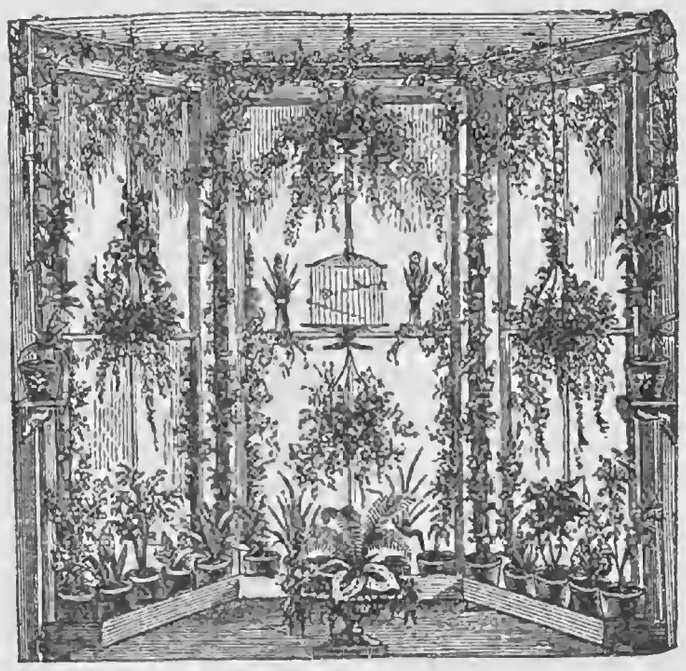
First, in selecting pots, do not use too large sizes, a small pot, if steadily cared for, and, by that, I mean if not neglected and allowed to become too dry, will furnish twice the bloom that the same plant potted in a much larger pot would afford. Large pots mean a profusion of foliage, small pots, of bloom. All pots should have a layer of charcoal on the bottom, red coals taken from the kitchen stove and cooled answer the purpose, affording better drainage, at the same time keeping the earth from souring.

I have found a soil composed entirely of leaf mold from the depths of the woods to be the very best, requiring the least water, and producing the richest color in leaf and bloom, but where it can not be procured, any good loamy soil, mixed one part sand, to two of soil, will do excellently, or in case of necessity, well rotted manure, but it must be well rotted, mixed one part soil, one of manure and one of sand, will answer. The fine dust swept from the street can be used as a fertilizer if no other is procurable. Now, that our pots are ready, comes the process of transferring. I usually water my plants thoroughly some hours before, selecting a cool, cloudy day if possible, and do the work as late in the afternoon as I can, thereby giving the plants the benefit of a nap before beginning their new life, which, by the way, should be quite in the shade in some cool room for the first three days.

All fine fibrous rooted plants are easily removed, while those of a single, or tap root, are best left to the ravages of the frost king. Some choice kinds as, for instance, the mignonette, can be planted in pots where they are expected to remain, in July or August, and make fine Winter bloomers.

Foremost in the floral ranks for lawn or conservatory is the extensive family of Geraniums. The large Zonale Geraniums that filled our borders with their flaming reds, their dainty pinks, and pure white through all the Summer will not prove good Winter bloomers; being so exhausted with Summer flowering, the removal causes them to droop their leaves, and half the Winter is consumed in an attempt to reorganize their shaken forces; but if we have carefully set cuttings through the Summer months that are about coming into bud, we can transfer them to the windows with little apparent harm, and they will continue to grow and bloom almost uninterrupted. The large stand-bys of the Summer, if lifted from the earth, about as a farmer "pulls" his cabbage, and fastened, roots uppermost, to the beams overhead in the cellar will keep until another Spring, when they may be set out, and with a little pruning they will grow rapidly into another Summer of bloom. A variety should be selected, if possible some of the double varieties, although I have a fancy for the familiar faces of some of my old friends like Francis du Bois and Jean Sisley.

Among the novelties we find New Life, a vivid scarlet, irregularly striped with salmon and white. In the double varieties are Casimer Perier, a flaming orange, bordered with salmon; Ernest Leuth,



IN-DOOR GARDENING.—FIG. 308.

an intense glowing crimson; Mme. Baltet, the best of all the double whites; Jennie Dolfus and Naomi as double pinks. These, or any other similar variety of color, are quite sufficient to illume the flower borders through the Summer, or the window garden in the gloomy Winter days.

There is an endless variety of silver-leaved, bronze, and tricolor, as ornamented foliage; about a dozen scented varieties, with the double and single Ivy-leafed Geraniums, which, together with the Pelargoniums or Lady Washington Geraniums, make up a list sufficient of themselves to fill our window garden, all requiring about the same culture and being the most easily cared for of all house plants, asking only moderation in all except light—that, however, seems to be a necessity for perfect development.

Among hardy Winter flowering plants I have a great fancy for the abutilon, really a greenhouse shrub, growing from five to ten feet in hight, and by some called Flowering Maple, from the resemblance its leaves bear to the maple. There are a number of varieties, some requiring a support like a fucia, and having a leaf rather long and narrow. But I do not fancy the abutilon when it attempts vine nature. I like it as a stately, symmetrical tree in miniature.

The abutilons are very popular on account of their cleanliness, healthfulness and almost constant bloom, whether as a bedding plant in Summer, or a house plant in Winter. In color of flower they range from pure white to crimson, scarlet and deep orange, with all intervening shades and veining. The foliage of some varieties is of a deep green, others, as A. Thompsonii, mottled with yellow shading out into a creamy white.

Achania is another green-house shrub, a continuous bloomer, bearing scarlet flowers and, from its freedom from insects and its easy cultivation, a most desirable house-plant.

Almost all begonias are also desirable for window gardening, as each has special merits either as constant bloomers, or from beauty of foliage, and in the same list we place Bonvardias, requiring about the same temperature as begonias, an average of 65 degrees, easy of culture and a profuse and brilliant Winter bloomer.

These last named require more heat than geraniums and abutilons, and can be given the warmest side of the plant stand or the brackets nearest the stove.

I must add just one word for the carnation, the old favorite that always flourished on the little plant stand beneath the clock in our mother's kitchen, and from which as an especial reward for good conduct, we were given now and then a great fragrant blossom, just as, dinner basket in hand, we stopped for the good-by kiss before starting on our long tramp to school. Never will the fragrance of the carnation drift past us, that it does not instantly picture the old red school house, the rows of pine desks, the childish faces, the clean pink pinafores and the great spicy bloom, mother's parting token, that lay on the desk just above the speller, and to which we stole admiring glances between each heart-breaking word.

"Your voiceless lips, O Flowers! are living preachers,
  Each cup a pulpit, and each leaf a book,
Supplying to my fancy numerous teachers,
  From loveliest nook.

"In the sweet-scented pictures, Heavenly Artist!
  With which Thou paintest nature's wide-spread hall,
What a delightful lesson Thou impartest,
  Of love to all!"

LETTERS FROM THE COUSINS.

UNCLE MARK AND COUSINS:—I see so many letters from the cousins I thought I would write too, I cannot say I care much for gardening. I like to see a good garden and pretty flowers as well as anybody. I guess the trouble with me is I don't like out-door work. Although if you would send some seeds they would be gladly accepted. For Elsie, my sister, likes to make gardens as well as I like to watch her. I guess we will have a well filled cellar this Winter, for ma has 300 quarts of fruit put up. Then we will have 100 bushels of apples if they are not stolen. And we are going to try to get some nuts. We have a great many vegetables to gather yet before frost. This is the first year for us to take the RURAL. We like it very much. Do any of your nieces or nephews never hunt stones, I am trying to get a specimen from all the States. Perhaps some of the cousins would send me a stone from a State I have none from. I have a stone from Iowa, Nev., Wis., Mo., Ark,, Kan., Dak., Minn., and N. Y. I got a stone that looks like petrified honey comb. I got $2.00 premiums for pantry stores at the Eldora fair, two years ago last Fall, $10.75 a year ago last Fall, $9 last Fall, and I was entitled to $9 more but they gave it to some one else by mistake. I am in my fourteenth year but I will soon be too old to write to you, will I not? Now Uncle Mark give an account of yourself, are you a real uncle? Ma never had any brothers or sister, so you are not her brother, and I guess could not have been a favorite brother of my fathers, or he would have said a little more about you, who are you any way? Do you like long letters. You have one here. I hope your waste basket will be too small for it. But good-bye. Your affectionate niece,

Eagle City, Hardin Co., Iowa. FLORENCE DALE.

[Uncle Mark does not like to tell his real history, sometimes we *play* characters as well as act them, although not always *real*; but there are some nieces in Iowa who can tell you all a bout Uncle Mark if they have a mind to.—U. M.]

UNCLE MARK.—I send a peach to-day, picked off of a tree grown from a pit that I planted three years ago—when I was six years old. I think it is a pretty good peach for the first trial don't you? I have a nice little flower bed, verbenas, pinks balsams, pansies and tube roses. I have also a few shrubs, flowering almonds, Japan Quince etc., that I got over at my grandfathers I dug up the sprouts from his bushes and brought them home and planted them, and they are doing first rate. I have a beautiful black walnut tree about two feet high that grew from a nut that I planted. I am saving flower seed for next year. Of the seeds sent to my father from the RURAL NEW-YORKER, he has nice young plants of all, except the magnolias, growing finely, and expects to have plenty of flowers from them next Summer. He has large mangels from the seed sent but don't think they are large enough to take the prize offered for the three largest. I would like to join the Horticultural Club with your permission. Your nephew. HARRY R. F.

Elmira, N. Y.

[The peach was very fine, it is not a very large sort but is a free stone of most excellent flavor, and was just ripe. We add your name to the list. U. M.]

DEAR UNCLE MARK AND RURAL COUSINS:—I have never seen a letter from Bitterroot Valley, Montana, yet, and thought I would write. I am nine years old but never went to school but very little but my mother has taught me at home. My father has taken the RURAL a long time and it will always be a welcome visitor with us. My father owns 200 acres of land and a band of cattle, horses and other stock. I love flowers very much and we have a good many nice vines this year. Crops are good here this year. Wheat will go about 40 bushels to the acre, oats 50 to 60. Some of the cousins will be surprised to know I never saw a railroad, but hope to some time. I wish some of them had the privilege I have to catch nice mountain trout and gather huckleberries, and rove over the mountains and see the playful deer, and the great big bears, but the latter I never care to bother. Please don't cast this in the waste basket as it is my first. ELLA GRACE.

DEAR UNCLE MARK:—I am a little girl eleven years old. I want to join the Horticultural club. I have three brothers and one sister. We all love flowers, my oldest brother and sister and I have flower beds. Ma has snapdragons, phlox, four-o'clocks, balsams, pansies, gladiolas, mignonette and others too numerous to mention. The most of the seed we got from the RURAL last Spring has done well. I like to read the letters from the cousins. From your niece,

LAURA G. BABENHOUSE.

Wayne Co., Iowa.

DEAR UNCLE MARK:—I have long wanted to join your club, and thought I would write, and hope this will not go in the waste-basket. I have a flower garden, and have all colors of balsams, pansies, sweet peas, petunias, phlox, drummondii, poples, portulacas, verbenas, and zinnias. Our Cuthbert raspberry plants are all alive. We have harvested our Molds ennobled oats. We take the RURAL, and like it very much. W. D. H.

Rockford, Ill.

PERSONAL ITEMS.

President Hayes has accepted an election as vice-president of the American Bible Society.

Ex-Governor Fenton, of New York, has declined a nomination for Congress from the thirty-third district of this State.

Justice Swayne, of the United States Supreme Court, according to a Washington dispatch, will retire from the bench next winter.

A Texas clergyman, about to become chaplain of a penitentiary, preached a farewell sermon to his congregation, who had ill-treated him, from the following text: "I go to prepare a place for you, so that where I am ye may be also."

Lord Beaconsfield, when he was the Disraeli of only 22 years, was a remarkable-looking young fellow. He had a pale, almost delicate face, jet black hair clustered in curls on a marble brow, beneath which flashed strangely brilliant black eyes. His figure was slender and lithe, and he wore a dress coat of black velvet, white kid gloves with draperies of black silk fringe falling from the wrists over his hands, and a waistcoat resplendent with gold lace.

[Fort Wayne (Ind.) Sentinel.]

Will Wonders Ever Cease?

Mr. John G. Fledderman, the well-known Merchant Tailor, in Union Block, writes: "I was a sufferer for many years with Neuralgia and Rheumatism, and found no relief until I tried St. Jacobs Oil. After using two bottles I was entirely cured."

Miscellaneous.

The Literary Revolution.

In January, 1879, **The Literary Revolution** was inaugurated by the publication of one small volume. In September, 1880, its list, published and in preparation, comprises over 120 volumes of standard books. It gives employment to about 500 hands, is actually delivering to purchasers over three tons of books a day, or over 1,000 tons a year, and is so far from able to fill all orders that additional buildings have just been leased, machinery purchased, and other steps necessary taken to double the present product within the next sixty days. To meet the popular demand for the coming twelve months at least **2,000 Tons** will be required. The almost 2,000,000 and probably 3,000,000 volumes will be required. The almost wonderful success which the Revolution has achieved is doubtless to be attributed to its leading principles, which are: I. Publish only books of real merit. II. What is worth reading is worth preserving—all books are neatly and strongly bound. III. Work on the basis of the present cost of making books, which is very much less than it was a few **of** years ago. IV. Books have commonly been considered luxuries; in a free republic they ought to be considered necessities, and the masses will buy good books by the million if prices are placed within reach. V. **Good Literature.** To make $1.00 and a friend is better than to make $5.00 only, and 1000 books sold at a profit of $1.00 each gives a profit of only $1,000, while 1,000,000 books sold at a profit of one cent each gives a profit of $10,000; and it is more pleasure as well as more profit to sell the million. The most important publication thus far undertaken—indeed the most important work ever published in this country—a work that every intelligent person wants in his library, is **Library of** the Library of Universal Knowledge. It is a verbatim reprint of the last London edition of Chambers's Encyclopedia, with copious additions by American editors, about 15,000 topics being added to the original work. It will contain, complete, about 10 per cent more than Appleton's and 20 per cent more than Johnson's Cyclopedia, though costing **Universal Knowledge.** but a fraction of the price of either. The publication of a large type edition of the Library of Universal Knowledge is just begun, vol. I. being issued September 1. Two or more volumes will be issued each month till the whole is completed in 15 vols. octavo of nearly 1,000 pages each. The price of the large type edition in cloth binding is $1.00 per volume; bound in half Russia, gilt top, price $1.50 per volume. According to our usual custom, special reduction in price is made to early purchasers, and during the month of September only orders for volumes I., II., or III., either or all, will be received at the nominal price of 65 cents per volume for the cloth, 95 cents per volume for the half Russia, gilt top. As a portion of the Library of Universal Knowledge, the Chambers's Encyclopædia is also published separately, complete in 15 volumes of clear nonpareil type, and sold, bound in cloth, for the nominal price of $7.50, or in half Russia, gilt top, for $15.00. In this style 13 vols. have already been issued, vol. 13 will be ready September 10, and Vols. 14 and 15 a few days thereafter. On this also special terms are given to early purchasers, the price being to those whose orders are received during September $6.75 for the set complete in cloth, $13.50 for the half Russia gilt top. The volumes already issued will be sent at once by express, and the remainder when completed in October. The Revolution is always undertaking **Chambers's Encyclopædia.** new enterprises and accomplishing new victories. During September in Religion we expect to complete Young's "Analytical Concordance to the Bible," the great "Webster Unabridged" of religious literature, and a 50 cent edition of Smith's Bible Dictionary. In Biography, two volumes added to our Acme Library of Biography complete the famous English Men of Letters series, at little more than one-tenth the cost heretofore. In Poetry we shall soon have the Iliad and the Odyssey of Homer, translated by Pope, and a large type edition of Shakespeare. In History a cheap edition of the celebrated Froissart's Chronicles, with over 120 illustrations. In Fiction, Scott's "Ivanhoe" and Bulwer's "Last Days of Pompeii." In Juvenile, "Karl in Queerland," profusely illustrated. The cost of making books diminishes in large degree as their number is multiplied. **Prices** Many of our books are selling in so much larger quantities than we anticipated that we find it in our power to considerably reduce their prices, and we do it with a great deal of pleasure. Among those so reduced are the histories of Macaulay and Gibbon, Taine, Rollin, Josephus, Modern Classics, Milton, Virgil, Dante, Koran, Bunyan, Crusoe, and several others. **Down.**

Standard Books.

WINTER DAIRYING A SUCCESS

By using **THE FERGUSON BUREAU CREAMERY.**

No special room or extra fire needed. Gilt-Edged Butter made at all times, winter or summer. It surpasses all others in quantity and quality of butter made. It excludes flies, dust and odors; is constantly at the correct temperature (58° to 60°); has room for the cream and butter, and saves three-fourths the labor. **THE FERGUSON CONCUSSION CHURN** is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Send for illustrated circular to **The FERGUSON MF'G CO., Burlington, Vt.** Ag'ts Wanted.

Humorous.

TEACHER—"What is a score?" Pupil—"A base-ball record." Teacher—"No, no; what I mean is, how much does a score signify numerically? What idea does it give you? That is to say, if I were to tell you that I had a score of horses, what would you think?" Pupil—"Please, marm, I should think you was stuffin'."

HE looked over all the papers on the news-stand, and not finding what he wanted, said to the plump, pretty girl-clerk, "I want a companion."—"What, sir?" she blushed.—"I want a companion," he repeated.—"Oh, yes, sir; I hear you now," and she chewed the corner of her apron; "well—well—do you think I would do?" It turned out happily.

A GRAY hair was espied among the raven locks of a charming young lady. "Oh, pray pull it out!" she exclaimed.—"If I pull it out ten more will come to the funeral," replied the one who made the unwelcome discovery.—"Pluck it out, nevertheless," said the dark-haired damsel; "it's no consequence how many come to the funeral provided they all come in black."

WHAT HE WAS QUICK AT.—A clerk was discharged, and asked the reason. "You are so awfully slow about everything," said his employer. "You do me an injustice," responded the clerk. "There is one thing I am not slow about." "I should like to hear you name it," sneered the employer. "Well," said the clerk, slowly, "nobody can get tired as quick as I can."

A GENTLEMAN traveling in a railway carriage was endeavoring, with considerable earnestness, to impress some argument upon a fellow-passenger who was seated opposite to him, and who appeared rather dull of apprehension. At length, being slightly irritated, he exclaimed, in a louder tone, "Why, sir, it's as plain as A B C!"—"That may be," quietly replied the other, "but I am D E F!"

A MERCHANT desirous of collecting a large outstanding debt, went to an agent and told him he would give him half the bill as commission for its collection. The agent agreed. Months elapsed. One day the merchant met the agent. "By the way, Mr. ——, have you collected that bill yet?" "Not quite," said the agent, moving down the street, "I got my half two months ago, but your half I can't collect to save me."

AN old darkey who was asked if in his experience prayer had ever been answered, replied—"Well, sah, some pra's is ansued an' some isn't; 'pends on what you axes fo.' Just after de wah, wen it was mighty hard scratchin' for de cullud breddren, I observed dat wen ebber I pway de Lord to sen' one o' Marse Peyton's fat turkeys fo' de ole man, dere was no notice took of de partition; but wen I pway that he would sen' de old man fo' de turkey, de latter was 'tended to befor' sun-up nex' mornin' dead sartin!"

A DOUBTFUL COMPLIMENT.

Harry (wishing to tease his sister)—"See here, Carrie, here is an image of you!"
Carrie (getting angry)—"And these are your sisters, too!"

What Nervous People Endure,

Nobody but themselves can adequately understand. The symptoms are often undefinable, though inexpressibly tormenting, and it well may be doubted whether any acute malady inflicts more tortures than chronic weak nerves. Invigoration is the surest course to overcome undue sensitiveness of the nervous system, which proceeds from weakness: the proximate cause of which is usually imperfect digestion and assimilation. That superb invigorant, Hostetter's Stomach Bitters, remedies that enfeebled and disordered condition of the stomach, which is the most fruitful cause of nervousness, and a rapid increase of vigor and ultimate disappearance of all nervous and dyspeptic symptoms, may surely be counted upon by those who are wise enough to employ this genuine remedy, in preference to the many palliatives of nervousness. A tablespoonful before meals will be found to improve appetite, as well as facilitate digestion, and a repetition of the dose at night promotes repose.

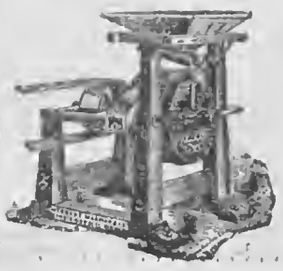
OF FRENCH BUHR STONE



Portable Mills for Farmers, Saw Mills etc.; 16 sizes; over 2,000 in use. Price from $30 up. Complete Mill and Sheller, $95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mills.
NORDYKE & MARMON CO., Indianapolis, Ind.

NEW DESIGNS
IN
WILTON, AXMINSTER, MOQUETTE,
VELVET, BRUSSELS AND INGRAIN
CARPETS.
Manufactured by Ourselves
Expressly for the Season's Retail Trade.

THESE GOODS WILL BE FOUND TO COMBINE TO AN UNUSUAL EXTENT
Elegance in Style and Finish,
Durability in Wear, and
Economy in Price.

WE ALSO OFFER AN EXTENSIVE ASSORTMENT OF Turkish, Persian AND East Indian CARPETS, RUGS AND MATS, DOMESTIC OIL-CLOTHS, AND OTHER Popular Floor Coverings AT
Extremely Moderate Rates.

J. & J. DOBSON
CARPET MANUFACTURERS AND RETAILERS,
40 & 42 WEST 14TH STREET, N. Y.
JOHN VAN GAASBEEK,
Manager.

WINTER RESORT.—To those who must Winter South, the dry, equable atmosphere of Tryon Mountains, with its Thermal Belt, offers great advantages as the intermediate clime, suited to all troubles of the Lungs.
The care of Invalids a Specialty. Address

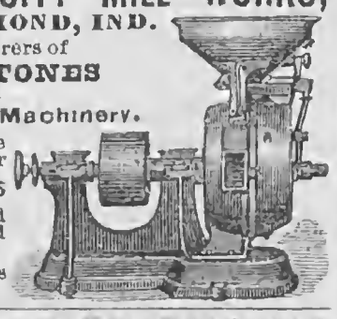
Lynn P. O., N. C.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y

Monarch and Young America
CORN AND COB MILLS

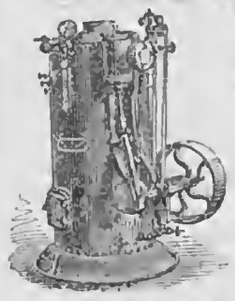
Only mills made with Cast Cast Steel Grinders.
Warranted superior to any in use, for all purposes. Will grind faster, run easier and wear longer. *Satisfaction guaranteed.* Also, Corn Shellers, Feed Cutters, Cider Mills, &c. Send for circulars and prices.
Manufactured by
WHITMAN AGRICULTURAL CO.,
St. Louis, Mo.

RICHMOND CITY MILL WORKS,
RICHMOND, IND.
Manufacturers of
MILL STONES
and
Flouring Mill Machinery.



We manufacture the best French Burr
CORN AND FEED MILLS
in the country. Send for description and prices.
State you saw this in RURAL N.-Y.

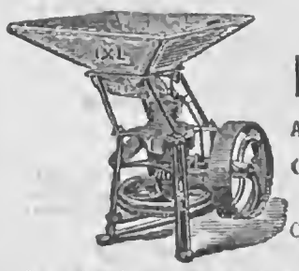
BOOKWALTER ENGINE



Compact, substantial, economical and easily managed.
Guaranteed to work well and give full power claimed.
Engine and boiler complete, including governor, feed-pump, drive-pulley, etc., etc. at the low price of

3	Horse power	$240
4½	" "	280
6½	" "	370

Manufactured at Springfield, Ohio. Send for Descriptive Pamphlet.
JAMES LEFFEL & CO., Springfield, O,
Or, 110 Liberty St., New York City.



I. X. L.
FEED MILL.
All Iron but the Hopper.
Cheap, Effective and Durable.
CAN BE RUN BY ANY POWER.
Capacity from 6 to 30 bushels per hour, according to size. Send for Catalogue and prices.
U. S. WIND ENGINE & PUMP CO.,
Batavia, Kane Co., Ill., U. S. A.

Metallic Shingles.
Make the most durable and ornamental roofs in the world. One-fourth the weight of slate, and will not break from any cause; cannot blow off, and are absolutely tight. Send for descriptive circular and reduced prices to
IRON CLAD MF'G CO.,
22 Cliff St., New York.

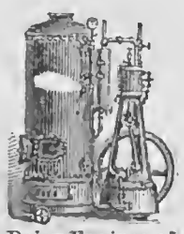
GREAT WESTERN GUN WORKS, Pittsburgh, Pa.

Send stamp for Catalogue.
Rifles, Shot Guns, Revolvers, sent c. o. d. for examination
Breech-Loading Shot Guns, $20 to $300. Double Shot Guns, to $150. Single Guns, $3 to $20. Rifles and Cartridges, $8 to $75. Revolvers, $1 to $25. Send stamp for Price List. GREAT WESTERN GUN WORKS, Pittsburg, Pa.

ELGIN WATCHES
all styles, Gold, Silver and Nickel, $6.00 to $150 Chains, etc., sent C. O. D., to be examined. Write for Catalogue to Standard American Watch Co., Pittsburg, Pa

PAYNE'S FARM ENGINES

Established 1840.



Patent spark-arresting Farm and Dairy Engines of all sizes, from 2 to 12 horse-power, mounted or unmounted. Warranted to be the Best and Cheapest engines made. Prices from $150 upwards. Send for Illustrated Catalogue "A" which will give you full information and prices to
B. W. PAYNE & SONS,
Box 841, Corning, N. Y.

"THE LADIES OF THE WHITE HOUSE,"
OR IN THE
HOME OF THE PRESIDENTS.
A History of every Administration from *Washington* to the present time. Includes much Personal and Private history never before published. Agents wanted. For full description address the Publishers BRADLEY & Co., 66 North Fourth St., Philadelphia, Pa.

THE IMPROVED EVAPORATORS

For Making SUGAR, SYRUP AND *APPLE* JELLY.
Make the best syrup and sugar with less fuel and labor than any other apparatus. Will condense sweet cider into delicious Jelly at the rate of four barrels per hour. Agents wanted. Send for descriptive circulars.
VT. FARM MACHINE CO.,
BELLOWS FALLS, VT.

COLUMBIA BICYCLE.

Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE MF'G CO.,
76 Summer Street, Boston, Mass.

DUTCH BULBOUS ROOTS.
Descriptive Priced Catalogues of our new importations now ready for mailing to applicants.
J. M. THORBURN & CO.,
15 John Street, New York.

MT. VERNON SEEDLING & KIRKWOOD STRAWBERRIES.
The two *largest, best,* and *most productive.* Introduced in 1880. Each yielded 10,000 quarts per acre, and sold at from 20c. to 30c. per quart. Catalogues free. Address WM. PARRY, Nurseryman, Parry P. O., Burlington Co., N. J.

NEW WHITE GRAPE DUCHESS
Also *newer varieties* Small Fruits, including Cuthbert, Gregg, Sharpless. *Prices low.* FARLEY & ANDERSON, *List free.* Cayuga Lake Nurseries, Union Springs, N.Y.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XXXIX. No. 40. Whole No. 1601. | NEW YORK, OCT. 2, 1880. | Price Five Cents. $2.00 Per Year.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Dairy Husbandry.

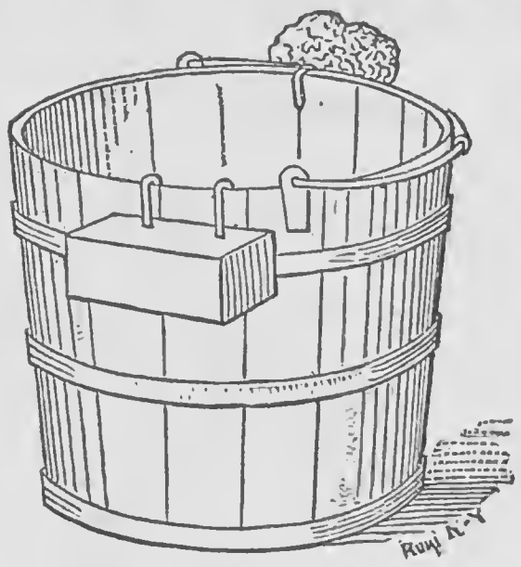
THE DAIRY COW—NO. 9.

HENRY STEWART.

Apparatus for Milking.

Every reasonable person desires to have his or her food perfectly clean. Milk and dairy products are not always clean, to put it only very mildly, and the filth that finds its way into milk is of a very disagreeable, if not unwholesome kind. As a large portion of the milk of a family cow—and much of that sold—is used by children, owners of cows should be excessively careful to have the milk perfectly clean and pure. This is easy to be done if it is desired. It requires only the determination to do it, and a very little attention.

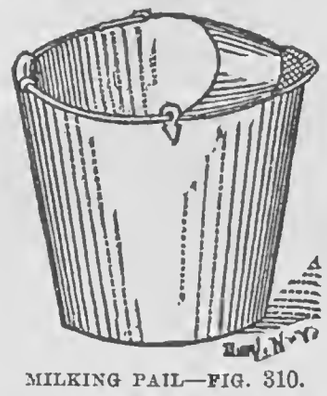
The cow is not a cleanly animal by any means, and some cows seem to delight in making themselves filthy. One of my best cows will take pains to lie down directly in her droppings, so that the udder is always besmeared, and other cows are very careless about it, at the best, so that it is necessary that a part of every milking apparatus should consist of a pail of water, a sponge, and a towel. Before the cow is milked the udder should be washed and wiped dry. For this purpose I have used a pail arranged as shown in the engraving,



DAIRY PAIL—FIG. 309.

which is taken to the barn at every milking. Previously the stable man has brushed and carded the cows, and has cleaned and sanded or littered the floor, so that there is no coarse filth to remove, and only the remaining smears. But if these are left on the teats, the filth will get into the pail in spite of all efforts. The pail has a hook on one side upon which the sponge is carried, and a box on the other, in which an old towel or pieces of cloth are kept. With these the udder and teats are washed and dried before the cow is milked. The time used—not lost—is well spent.

The milking pail should be provided with a strainer, and I have found none made for sale free from some objection, either as regards the difficulty of cleaning or durability. I have my pails made to order with the strainer upon the half-cover of the pail at the edge, and with a lip at the edge to cause the milk to flow easily. There is no difficulty in washing this pail, the wire gauze cannot be broken in the washing, and it is perfectly cleaned with ease. Hairs *cannot* be kept out of milk at some seasons, and a fine hair carried lengthwise *will* pass through the finest wire cloth. It is therefore necessary to use precautions in straining. A hair will not pass through a cotton cloth, and in straining milk into a deep pail I use the strainer shown at Fig. 310, which has a piece of washed, somewhat coarse and thin, white muslin, fastened around the bottom hoop. This causes the milk to pass through three strainers at one time, which is sufficient. Where the milk of several cows is strained the strainer should be rinsed after each use, otherwise the after milk passes over all the impurities gathered in the strainer. For shallow pans the double strainer, Fig. 311, is excellent.



MILKING PAIL—FIG. 310.

The middle strainer fits closely into the bottom of the basin over the fixed strainer, and the basin rests in the perforated hoop which stands in the milk pan. A cloth may be tied over the top of the basin if thought proper. With all these precautions the most complete cleanliness is within easy reach, and if the cow is healthy and is well fed, the most fastidious person may drink the milk without any apprehension. While it is so easy to be clean, the conscientious dairyman need have no excuse for violating propriety, and excuse himself by the idea that it can't be helped.

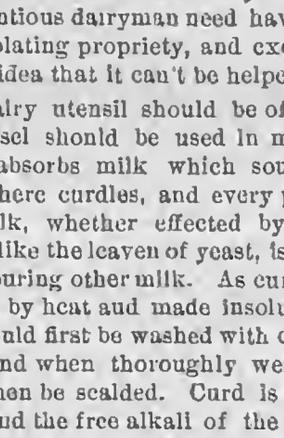
Every dairy utensil should be of tin. No wooden vessel should be used in milking, as the wood absorbs milk which sours in the pores and there curdles, and every particle of curdled milk, whether effected by rennet or by acidity, like the leaven of yeast, is an active agent for souring other milk. As curd of milk is hardened by heat and made insoluble, dairy utensils should first be washed with cold water and soap, and when thoroughly well cleaned they may then be scalded. Curd is dissolved by alkali, and the free alkali of the soap not only removes the grease of the milk, but also any particles of milk which by any accident may have been retained in a crevice or corner, and there soured or curdled. To make the cleaning of dairy vessels more easy it is well to have no sharp corners, but to have all the joints made round, and this may be done easily if one has the milk pails made to order.

The Herdsman.

HEREFORD CATTLE.

A. B. ALLEN.

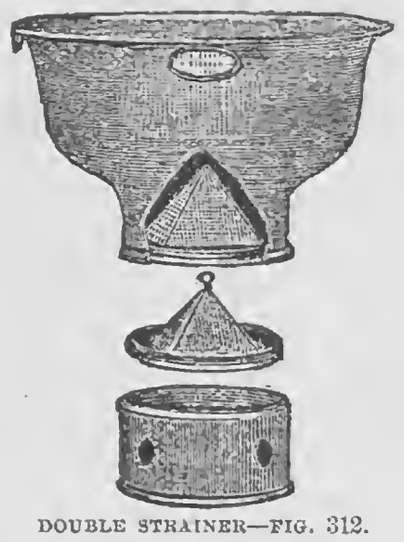
Owing to their large size, fine points, good form, quick feeding, early maturity, hardiness, and the excellent quality of their beef, quite a boom has sprung up latterly for these cattle, particularly for stocking our great Western plains. The importations of Herefords from England thus far this year, I believe, number fully 200 head, or possibly more, all of which have gone to the Western States and Territories for breeding purposes exclusively.



STRAINER.—FIG. 311.

The first Hereford importation into the United States, so far as I can learn, was made in the year 1816 or 17, by the late distinguished Kentucky statesman, the Hon. Henry Clay, and kept on his farm at Ashland, near Lexington. Soon after this, Admiral Sir Isaac Coffin, of the English navy, sent a Hereford bull, and possibly a cow or two, to his friends in Massachusetts. I hear of no other importations till 1840, when upwards of 20 were brought to Albany, New York, from which place their produce went to other parts of the State and the West. A large herd was kept for some time, and may still be, on a farm at the head of Otsego Lake: but they did not find much general favor for some time among our cattle-breeders; not because they were wanting in merit, but owing to the greater fancy for Short-horns, which took precedence at once over all other breeds, and will probably still continue to do so. Other small importations continued to follow from time to time in the United States, but in larger numbers in Canada.

In the past century the Herefords were usually of a dark-red color, approaching sometimes almost to a brown. Among them, now and then, was a gray or roan, or a pure white with red ears. Now the fashionable color is a yellowish to a deep mahogany red with white or brackled face, a line back, and white sometimes down the neck, on the chest, and under the belly. The horns are long, usually standing out straight from the sides of the head of bulls, but with cows, and more especially with bullocks, they take a lofty, upturned form, which gives the animals a very noble appearance.



DOUBLE STRAINER—FIG. 312.

The modern change in color of the Herefords some attribute to a stolen Short-horn cross, which may probably be the case in a few instances; but I should think it may be derived from crossing those of a white and roan color on the dark-reds, which would easily make the present difference of colors. I much prefer those of the yellow or golden red mingled with some white; for I have found such more compact in form, with finer, softer hair and better handlers. They are said also to mature a little the earlier, are more easily kept, and are quicker feeders. The cows also of this color are better milkers than the dark-reds. The English breeders have not cultivated the milking quality to any extent, being satisfied if a cow can bring up her own calf. At the West this is rather an advantage, as the calf is usually allowed to run with the cow till she weans it herself when it is five to seven months old, according to circumstances. The same practice used to be followed in Ohio and adjacent States formerly with Short-horn cows, and as many of these were great milkers, and the calves did not suck all they made till pretty well grown, it gave the cows great pain to retain a part, and often ruined their bags and some of their teats.

The Herefords excel in the brisket and loin, two important points in all animals destined for the butcher; but they are apt to drop from the hucklebones to the tail, and here and in the hind-quarters, they are not generally nearly equal to the Short-horns. Their breeders aware of this for some time past, have been endeavoring to improve them in these points, in which I heartily wish them success.

A strong rivalry is destined to go on hereafter between the Herefords and Short-horns, to stock the broad Western plains; and which, ever finally takes precedence will be obliged to do so by showing superior merits. I think the latter at present the best animal, especially for grading up the produce of native cows, and making acceptable steers for supplying European markets. The only objection I ever heard to Short-horns is, that some of them are a little tender; but this is owing entirely to their being over-fed when young, and tenderly brought up. I have seen them for years in a cold, Western climate, and found them to be as hardy as the native cattle there, or any other breed whatever.

Sheep Husbandry.

THE AMERICAN MERINO.

The American Merino is one of the triumphs of American breeders. The thorough acclimation and adaptation of the Spanish sheep to our peculiar circumstances and necessities is a remarkable and conspicuous instance of successful efforts to reach a desired end. Our native-bred Merino now stands first in the ranks of fine-wool sheep in the world, and is sought by foreign breeders as a source of improvements in their flocks. Its fleece is the heaviest, the staple is the longest and as fine as the finest, and its carcass the heaviest of any living Merinos. No other sheep is so well adapted for the purposes of a people who desire strength and durability as well as beauty in their dress staples, or as a basis upon which to build up different cross-breeds which may be profitably kept upon arable as well as grazing farms, to supply the best mutton, as well as every class of raw material for our native manufacturers.

The Merino is the oldest domesticated sheep. It supplied the ancient Romans with the fine wool from which the imperial purple robes were manufactured, and with such care was the wool grown, that the sheep which bore it were continually blanketed or otherwise protected, even in the warm climate of Spain. From that time up to 1809 and 1810 the Spanish Merino stood first as a wool producer, and in those years nearly 4,000 of those sheep were imported into America from the choicest flocks of that country. A few importations had been made in 1800 and the following years; and it was from the importations of 1802, by Col. Humphreys, that some of the best strains of Vermont Merinos have descended. The history of these Merinos and their descendants has been varied and eventful, and their "ups and downs" have been wonderful. Animals have sold for one dollar at one time, and $10,000 have been refused for one at another time. But, after all, we have now arrived at a steady, substantial condition in which this sheep, excellent in every respect, stands upon its merits, as the first variety in the world as regards utility. It is the basis of our enormous wool production of 250,000,000 pounds per annum, worth to-day $100,000,000. It supplies directly the material for the fine cloths used for men's garments, the finer fabrics for ladies woolen clothing, the mixed fabrics of wool and cotton known as delaines, and by other names recognized only by ladies, as well as for an infinite variety of articles of lesser note. Its wool is not only carded, but is combed and therefore supplies a wide range of uses. Indirectly, as the parent of grades, it helps to produce wools fitted for nearly every use, from the carpets under our feet to the hats upon our heads, the umbrellas which shelter us from the shower, and the broad flag which waves over and shelters every citizen from foes at home or abroad.

Formerly its carcass furnished but a poor quality of mutton, but now its mutton is respectable both as to size and flavor. Crossed

under the larger breeds it furnishes the best and fattest market lambs, and makes desirable mutton for home use and for export. In short, if one intends to keep sheep of whatever kind, unless it be some other pure variety for breeding, he cannot begin without the help of the American Merino. It not only exists as a splendid example of successful breeding, but it points emphatically to the hope that in time we may produce distinctive types of other breeds as greatly improved upon the imported originals as this has been.

The American Merino is a medium-sized sheep, weighing, alive, from 120 to 150 pounds. Its figure is accurately represented in our illustration, which is a portrait of a once famous ram, "Golden Fleece," bred by Mr. E. S. Stowell, Cornwall, Vt. It is squarely built, with deep flanks and brisket, and is covered with wool in every part except the tip of its nose. It carries the still favorite wrinkles in its skin, although it is far from being as wrinkled as many rams of this breed. Merino wool is peculiar for its heavy yolk and plentiful grease, but while this is a necessary and advantageous peculiarity for a fine and close-wool sheep and prevents the cotting of the fleece, it is especially valuable when the rams are used for the improvement of the common native sheep of the Western States and Territories, whose fleeces are dry, coarse, harsh and of little value; but which, when improved by crossing with the Merino, are soft, fine and of a staple almost of equal value with the wool of the pure breed. So in crossing with the long-wool breeds whose fleeces are apt to be thin and open on the back, the pure Merino cross has a fleece as long and as lustrous as that of the parent, but it is softer, closer, and gives better protection to the graded sheep from storms.

The introduction of the pure Merino in Texas, Colorado and New Mexico has doubled the value of the flocks there, for no flockmaster can afford to grow native wool when one cross of Merino not only doubles the weight of the fleece, but doubles the value of the staple. Moreover, the increase of size in the cross-bred wethers has given them a value as mutton which the native sheep never had. It is not uncommon for a Western flockmaster to import as many as 50 rams in a "bunch," from Vermont or Western New York for use in his flock on the Western plains. Our Merino is at home in the hills and valleys of Vermont and Northern New York; in the western fields of Wisconsin and Michigan; on the rich prairies of Iowa and the bottoms of Ohio; it braves the "blizzards" of Minnesota, the hot, dry winds of Colorado and Kansas and the "northers" of Texas and New Mexico; it thrives everywhere, in sun and snow, in valley and mountain and dry plain; it is cosmopolitan; it is American in every sense of the word. It has also carried its good qualities into the far-off isles of the Southern Ocean and is welcomed as a benefactor among the flocks of Australia and New Zealand, where it has gained the reputation of being the best sheep of its kind in the universe, a distinction which it fully deserves.

The Poultry Yard.

GEESE.

HENRY HALES.

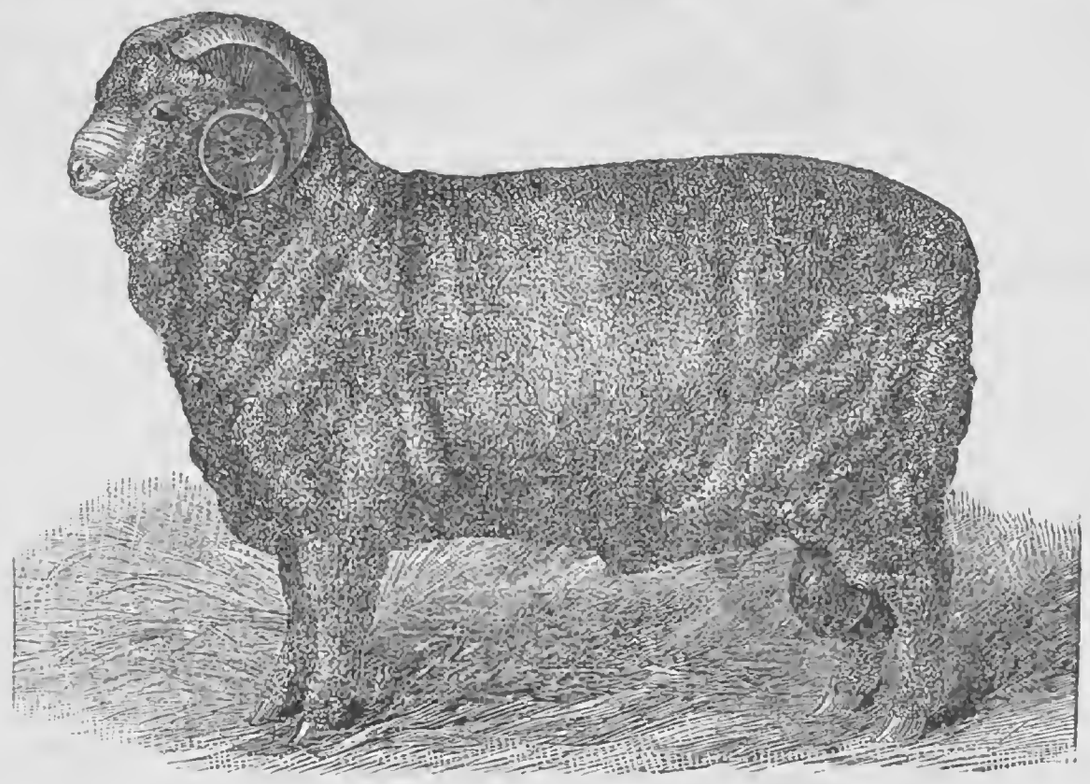
LIKE poultry, geese contribute a considerable share to the sustenance of man, and have done so from very remote times. Some of the first things we learn are the melodies of Mother Goose. The common goose is bred from the wild Gray-lag of the Old World, and was imported by the early immigrants to this continent, with what results are seen at our great markets, where immense numbers are sold in Fall and Winter.

Geese are kept at a good profit where the locality is well adapted to raising them. When kept on some waste lands which are of little use for any other purpose geese are often very profitable. They require but little water, being better vegetarians than ducks; in fact, they will graze like sheep. Their legs are set further forward than those of ducks, which enables them to walk easily. They will often walk a long way daily to beat all over their pastures. On commons, or such waste ground, where many cottagers turn out a number of flocks, it is a pretty sight to see each flock trailing in Indian file at nightfall to its respective home. By giving them a light feed of grain or corn at night, they will be very punctual in this habit.

There are several varieties of domestic geese, besides the common. The principal sorts are the Emden, Toulouse, and China geese, all of which are large varieties.

The Emden, so called from the town of that name, now in the province of Hanover, are pure white and of immense size. Some geese have been exhibited weighing up to 26 pounds each, and ganders as high as 32 pounds. The feathers, being white, are more valuable than dark ones. The bills are flesh-colored, the legs deep orange.

The Toulouse, so named from the city of the same name in southern France, are gray; the necks are dark; the bodies and breasts are lighter; the legs of a deep orange, the bills dark-red, light towards the points. These noble geese stand squarely on their legs; their large, deep breasts give them a very solid appearance. The legs and necks are a little shorter than those of other breeds, and they show a sort of dewlap, or loose flesh, under the upper part of neck. They are the embodiment of the true goose shape and build, and with that peculiar gray color, they are the truest representatives of the goose. Some are occasionally bred a lighter silver gray.



MERINO RAM "GOLDEN FLEECE."—FIG. 313.

The China geese show two varieties—white and gray. These are also large geese with a thick, almost black, knob at the upper part of the base of the bill. Their necks are long which gives them a swan-like appearance. They show a stripe down the back of the neck. In the gray-colored this stripe is brown; in the white, the streak is faint; but all pure-breds show this stripe and also a dewlap. This goose is a native of the southern and eastern parts of Asia. All geese have a strong, brassy-like call, but this one gives out a strong harsh note like a deep trumpet blast. It is more prolific than other geese; while others lay about 15 eggs, this bird lays about 30, but the eggs are not so large as those of the two former breeds.

There are several other sorts of geese, but they are kept more for curiosity than profit. Geese are less troublesome than poultry or ducks. They are good mothers to the goslings but are not good hatchers. Two to four geese are enough for one gander; the latter shows a preference for one female more than for the others. The eggs may be set under hens—three or four are enough for a moderate-sized hen. When a goose appears tractable (some are very ugly when inclined to sit), it is well to let her hatch one brood, and when those hatched under hens are big enough, they will all go together.

Thirty days is the time required to turn out a gosling from the egg. They are hardy and easily raised when young. They should be fed just like young ducks. Oats, corn, or wheat meal with potatoes, chopped green onions, chives and salad are good for them; but they soon learn to graze. It is best to coop up the mother goose or hen for a week or two till the little ones get strong enough to follow her well, or they get tired out and left behind. I have seen an old goose turn back and try to rouse up a flagging gosling, showing astonishing solicitude. Goslings grow quickly and when well fed take on flesh rapidly. They are more easily kept than ducks on a farm in Winter; they will eat more vegetable food, such as turnips and other refuse vegetables chopped up for them. It is said they will eat hay, tied up in bundles in their house in Winter, but it must be kept off the floor.

Geese are a great protection from thieves or intruders; they will raise an alarm when they hear a strange footstep or noises. In parts of southern Asiatic Russia, where the people dwell far apart, they keep geese as a protection in the lower part of the house when they retire up-stairs for the night. Many people think geese simple things, but the reverse is the fact—they are very cute and observing, knowing friends from foes, and have a very discerning ear for sounds.

Many people used to pluck the feathers off the breasts of these birds three or four times a year; this is a barbarous practice too cruel to be countenanced. Just before the time of molting it may be done with profit and not much loss to the bird, as the feathers at such times come off very readily naturally, and it does not make the bird any weaker, but to compel nature to make new feathers out of season, is a hardship to the suffering bird. The quills are still in demand for pens, although the demand for them for this purpose is nothing like what it was before we had steel pens.

The goose does not bear out the theory advanced by some naturalists that an animal lives to a shorter or longer life in proportion to the time it takes to mature. Geese mature early yet live to a great age; many are known to have lived thirty or forty years, and some say they can live to double that age, but as they become ill-tempered as they get old, many are killed on that account. A blow from an old goose's wing is no joke. They do not lay until they are over a year old, but as they are so easily kept on grounds adapted for them, they are profitable in such cases, especially if there is some natural water, as they must always have access to water, even if it be but a small pond.

Horticultural.

RURALISMS.

THE adornment of the grounds connected with public suburban and country schools is a subject that has occupied a good many of my thoughts for years past. Mostly unfenced, covered with stones, heaps of dirt, and overrun with weeds, they present a deplorable appearance. It seems to be nobody's business to look after them: at least, nobody makes it his business, and nothing is done. This condition of things is a reproach to the country, and a great shame to school and district committees. It is sad to think that the young and plastic minds of children should receive their first teachings in the midst of such surroundings. I think that an effort to have a part of the public school moneys set apart for the improvement of these grounds would be successful. If not, there ought to be public spirit enough in every school district to raise the money. In any case, there is no sufficient excuse for the present general condition of these school grounds.

I was for years a member of the Board of Education of a neighboring city, and I am therefore prepared to say that school committees would seldom be without means of ornamenting the school grounds if they manifested some interest in the subject; but they seem generally to care nothing for it; which is presumptive evidence that the right men are not in the right places. In the suburbs of Newburgh there is a district school, the grounds of which will compare well with almost any private garden in the place; but it is done by the janitor at his own expense, much to his honor, and no thanks to the school committee.

There is a district school almost within sight of the window where I am writing. Last Spring the grounds were inclosed with a neat fence. The principal and his scholars gathered the stones and built a mound of them, and made a small bed for flowers. I gave them some cannas, etc., for the bed, and a tub planted with nummularia and portulacas for the mound. The children were given a kind of ownership in the plants, and undertook the weeding and watering, and during vacation have done their part faithfully. The plants have looked remarkably well all Summer. This arrangement gave the children a personal interest in the plan, and secured its success. This might very generally be done, and this case is only mentioned as one of several such examples. But this column is not the place for a discussion of the subject, and I say no more. I thought, however, that an allusion to a subject of so much interest and importance might lead others to think seriously of it, and in this way do some good.

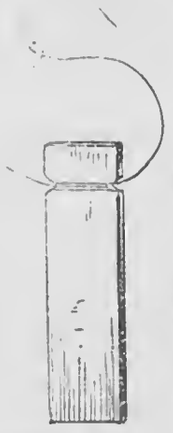
I regret to see that the black thrips is increasing among us at a fearful rate. It is by far the most destructive of its class, and the hardest to kill. I believe it to be an importation from Japan. It would seem to have good taste, for it attacks first some of our most highly prized and beautiful plants, and soon makes them unsightly things. It is very hard to manage. A strong solution of carbolic soap will kill all that it touches; but it is difficult to make it reach them, and will injure some plants when made strong enough to kill these pests. Tobacco smoke is an effectual remedy, but it must be made so dense and strong that it badly injures fuchsias, heliotropes, orchids and other plants, which should be removed from the house when smoking for the black thrips. Unfortunately, it is taking to the grape-vine, both under glass and in the open air, and is worse than its brothers, bad as these are.

There have come to my personal knowledge some deplorable cases of poisoning by the use of Paris-green and London-purple in the state of powder. They are dangerous things to use in the garden in any form, unless the utmost care be used, especially near beds of lettuce and similar plants. I think it is a plain duty of all editors and seedsmen to warn the public against the use of these remedies in the form of powder. Human life is worth too much to be risked in this way.

I do not remember ever to have seen the mealy bug and scale so very abundant as they are now (Sept. 2) and have been during the Summer. The season seems to have been favorable to their increase, for they have both multiplied with a fecundity scarcely less than that of the green fly. It is always well to note such exceptional seasons. They should have, and generally do have, the effect of calling attention to better methods for their destruction. Thus far I have used nothing better than a solution of black carbolic soap. A little experience enables one to judge about how strong it may be made with safety. There are specifics sold in the seed-stores, some of which are good; but they are altogether too costly for use. I would advise all who grow plants in pots to free them thoroughly from these pests before taking them into the house, especially those who grow plants in rooms.

In speaking of metal labels in a former paragraph I had concluded to say nothing about wooden labels. They will continue to be used, however, for a long time to come, and I will therefore tell the reader how he may add to their usefulness and durability in quite an inexpensive way. I have for about five years been making experiments with this end in view, and find it most conveniently and satisfactorily accomplished by using a refined petroleum oil. It has also been tried with the best results by friends to whom I have recommended it. I was led to use it from knowing that petroleum is an excellent wood preserver. All you have to do is to dip the labels in the oil, or, better, tumble a bundle of them into a pan of it for a short time, and take them out to dry. You may at any time thereafter write upon them with a common lead pencil, and the writing will remain legible for years. I say years, because at the end of two years I find the writing about as plain as when first put on. The oil has some body, and is very penetrating and preservative. Labels buried in the ground for a year showed no signs of decay. I strongly recommend this oil to nurserymen and florists as being better than paint, no trouble to use, pleasant to write upon, and very cheap. Those who cannot conveniently get this oil will find kerosene a good thing to use in the same way, but not nearly so lasting.

[In this connection we beg leave to interrupt Horticola for a moment. We have for three years past used wooden labels with a copper wire so fastened, as shown in the cut, that there can be no danger of its binding or cutting into the wood. One end of the wire passes through a loop in the other end. The labels are first thrown into raw linseed oil that is barely colored with white lead. This will preserve them for years and give a surface that can be easily written upon with lead pencil. Eds.]



WOODEN PLANT LABEL.—FIG. 314.

I must thank "Kit" for his kind allusions to me on p. 502. He does me but simple justice in supposing that "Ruralisms" will be free from any thing in the nature of malice or ill-will. Happily, I have no personal animosities to ventilate, and I entertain none but the kindliest feelings for the whole horticultural guild.

Field Crops.

JUNE GRASS, OR BLUE GRASS.—[Poa pratensis.]

PROFESSOR W. J. BEAL.

In the Northern States this is also known as "Spear Grass," "Green Grass," "Kentucky Blue Grass." In Kentucky it is often called "Blue Grass." It is one of the most common and most useful grasses of this country and of Europe. The genus Poa, to which this belongs, also contains several others of importance, such as Fowl-Meadow Grass, Rough-Stalked Meadow Grass, Wire Grass, etc. They are all fine and nutritious. A scientific description here would be passed over or not understood by most readers.

The lower palet is supplied with woolly hairs on the back. The leaves are compressed, and at the tip resemble the end of a little boat. The panicle is short—pyramidal; the foot stocks run extensively at the base, much like those of Quack Grass. The flowers in Michigan appear about the 1st of June, and nearly all come on at once. It is hard to find a single panicle of flowers after the first crop has passed out of flower. Inquiries are often made in reference to this grass, although it is common almost everywhere. In most places the flower stalks are short and would make only a light crop of hay. In strong, rich land the crop of hay would be medium in bulk, though heavier than most people would estimate. The hay, if cut when in flower, as it should be, is excellent for all kinds of stock. A little forkful goes a great way when compared with clover hay. As I mentioned, there is no second crop of stems, but the leaves continue to grow throughout the year when the weather is not too dry or too cold.

There is no better pasture than that produced by June Grass, though some people are not satisfied with the quantity. June Grass is a perennial, and will last as long as any grass, or as long as insects or cultivation will permit. More than one year is required for it to become well established, hence it is not well adapted for alternate husbandry.

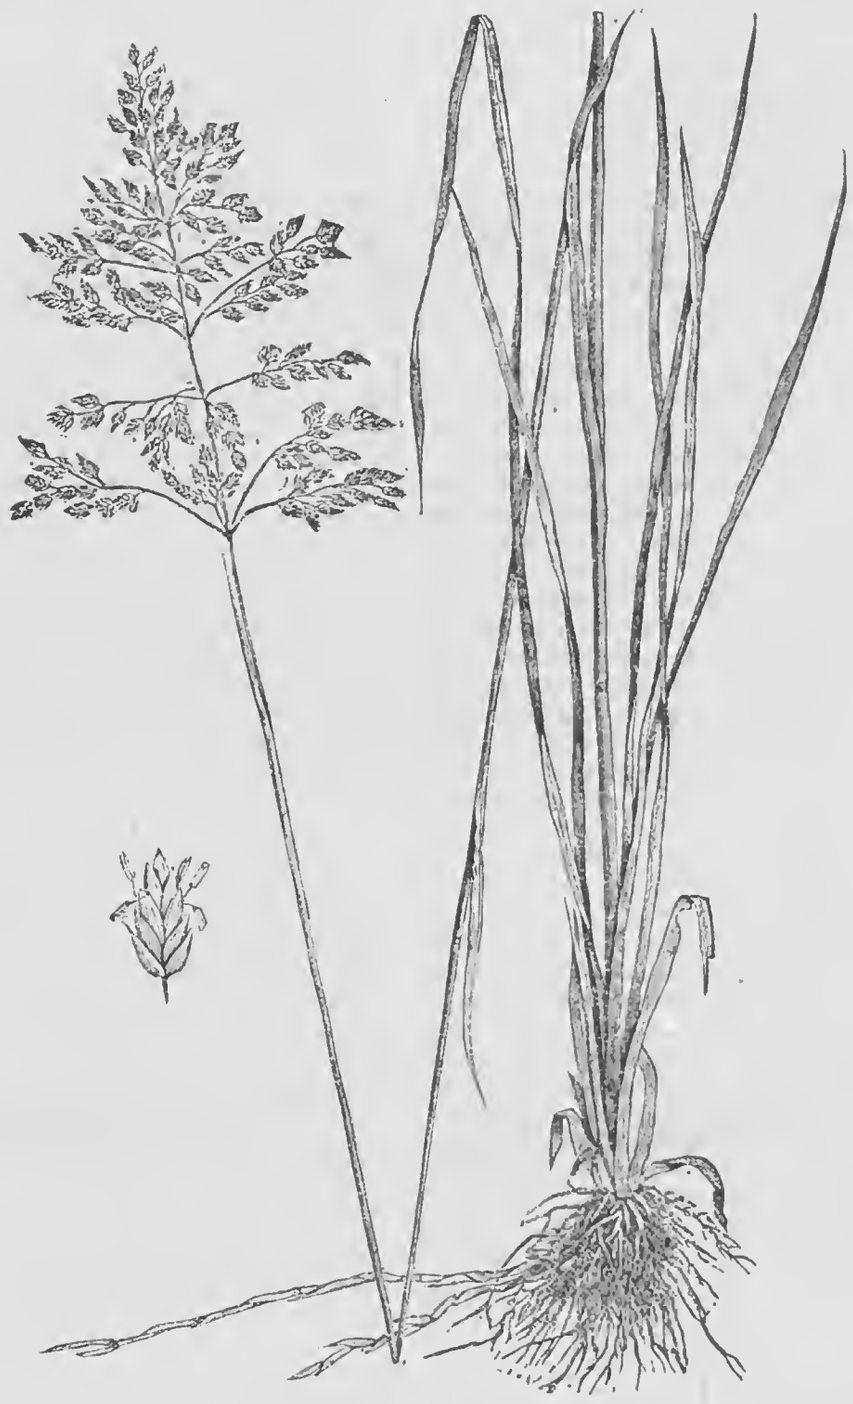
In the RURAL, within two years, I stated the result of an experiment at the Michigan Agricultural College. Seeds were obtained in Kentucky from two different seedsmen of what they called Blue Grass. In all respects, so far as any one could see, they were identical with the June Grass at the Agricultural College. The Kentucky grass was no larger, no earlier, no later.

In low or wet ground June Grass is one of the hardest weeds to kill out or keep down. This every farmer is too familiar with. There is no grass of my acquaintance, except Quack Grass, which will spread faster from a few seeds or roots. June Grass is the best of all our grasses for a lawn, and when sown on rich land and cut often, it makes a soft, thick, green turf, which is a delight to the eye and to the feet which tread upon it. For a good lawn there is no need of sowing any other. A uniform appearance in the grass is desirable. Where the grass only is sought for, and that in the shortest space of time, prepare the soil well and sow the grass early in Spring or September, if not too dry. It is a mistaken notion to sow oats or clover or some rapid-growing plant with June Grass to shade the young plants. It would be about as sensible to raise pigweeds to shade corn, or some coarse weeds to shade wheat.

In my grass plats, where I have raised from 150 to 200 sorts of grasses and forage plants for the last seven years, June Grass causes more trouble than all the rest combined. It gets into everything. Other weeds can be quickly seen and taken out, but June Grass must be allowed to grow awhile to be distinguished from some of the other grasses. Near my beds of grasses on dry sandy loam was an old lawn seeded with June Grass and Perennial Rye Grass. June Grass ran out the Rye Grass in about five or six years. Within three years the seeds of several large Fescue, Orchard Grass and Oat Grass have blown into the June-Grass lawn and taken a firm footing. In several places the June Grass is giving up more than half the ground to these large grasses. No manure has been used within ten years. This contest is watched with much interest, and suggests the propriety of trying the experiment on a larger scale on some of our old pasture or meadows.

SHALL POTATOES BE DUG TO PREVENT ROTTING?

It is a question which there has been much discussion upon, whether, after potatoes have begun to rot in the ground, it is best to dig and store them immediately, or to leave them undug until they have done rotting. Many claim that if dug and collected together they will continue to rot as badly as if left in the ground, or even worse, while others argue that the rotting will be checked, at any rate, to a considerable extent, and more be saved than if left undug, especially if they are stored in not too large quantities in a body, and in a cool place. I have always been disposed to accept the theory that after the rot has appeared the sooner they are dug the less rot there will be; provided, at least, they can be stored in small quantities together, as in barrels or small boxes, and kept in a cool cellar or other suitable place; and my observation



JUNE GRASS—POA PRATENSIS.—FIG. 315.

and experience have served to substantiate this belief.

In the Summer of 1878 I began digging my Early Rose potatoes early in September, and found at that time a very few rotten ones among them. After digging about half of them I was, by some means, prevented from finishing the work for about two weeks. I remember that during this time, in conversation with a friend, a farmer of many years more experience than myself, I expressed my regret at being unable to finish digging them, and my fear that they were rotting badly, and he made the remark that he would rather they would rot in the field than in the cellar. Now for the result. When I dug the rest of them I found fully one-half or more of them rotten, and quite as large a proportion of these rotted after being put in the cellar, as of those first dug, neither of them rotting badly after digging. I have long made it a rule to dig as soon as possible after the rot appears, and am yet to be convinced that I make an error in so doing; but would be glad to hear from any one who, by actual test, has proved this theory false. E. J. BROWNELL.

The Mold's Ennobled Oats.

Friend Talcot's criticisms upon Mold's Ennobled Oats, in the RURAL of September 4, may be all right, but as far as yield is concerned they are tremendous. From the small package received from the RURAL office—not over an ounce—I have 9½ pounds after a hen and chickens had got some fine heads that had broken over. I planted them in a drill one row across my garden, without any special care or manure, with the above result. From one kernel which I pulled up, with 19 stalks and full heads, I had 762 grains of oats. I think them very handsome while growing, but how they will prove for feed, time will tell. So far as I have any recollection I believe Mr. Talcot was the first agricultural writer that denounced the much-praised Norway Oats, and for this he deserves the thanks of the farming public.

Too much cannot be said in favor of the Beauty of Hebron potato. S. L.

Farm Topics.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

THE VALUE OF FOOD AND FODDERS.

In his column of "Jottings," (page 569), "Kit" refers somewhat doubtfully to the feeding values of certain kinds of fodders as tabulated in an article in the RURAL on feeding cows, page 520. He seems to have missed sight of the fact that in that article I expressly stated that I was doubtful of the correctness of the estimates of the value of the coarse fodders as given in the tables and referred to by "Kit." The truth of this matter is that these theoretical values are all we have to guide us, and are by no means satisfactory, and never can be, although many very elaborate experiments have been made to verify them in practice. More especially is the difficulty found in feeding milking cows, when the product of milk is made the test of these supposed values; for a great deal depends upon the manner in which the fodder is prepared for the cows.

For instance, last Winter I fed for two weeks to 15 cows some excellent, clean, Timothy hay, bright and green, but consisting almost wholly of stalks and heads—just such hay in fact, as would be thought the choicest kind of horse hay, and worth to sell one-half more than mixed clover hay. But the product of milk fell off nearly one-half, and the butter was very inferior. I was surprised, however, to find on the last days of the two weeks, that the cows were gaining rapidly in milk, and in searching for the reason, found it in the fact that they were eating up their bedding as fast as it was thrown under them. The bedding was sweet, marsh hay cut on a swamp and thought to be dear at $5 a ton, the price at which I bought it. To verify this, the marsh hay was fed for a whole week and the Timothy was used no more. The milk kept gaining the whole week, and was nearly up to the former weight, when the cows were fed on mixed clover, Red Top and Blue Grass, such as is known as the best cow hay. This was fed, cut and wetted to a thin mush with steeped malt sprouts, and cotton-seed meal. This mode of preparing the feed produced the most milk I could get from the cows. When the same hay was fed long and uncut and the sprouts and meal were given separately and dry, the milk fell off again more than one-third. There is much to be learned in the matter of feeding. We are as yet only on the threshold of our knowledge of the art. I am sure that the feed is better digested and made more productive by mixing the fine and bulky together, and adding some moisture; perhaps it is better masticated and made more digestible, by the mixing. Just now I am feeding my experimental cows upon cut grass, and I find it makes a loss in the milk to give the meal dry and separately instead of scattering it over the grass in the feed troughs.

The value of the food given to cows in a year's feeding is enormous, probably equal to $500,000,000. To use this to the best advantage is of vast importance, because it may easily be used so as to lose one-fourth of its possible value. Here is a great field for investigation by experiment stations, which should not be alone devoted to the growing of crops. For what is the profit if a farmer should grow great crops and lose a large portion of them in the feeding of them to his stock? I am a strong advocate of cutting, grinding and mixing food. I have practised it for 20 years, and am satisfied that in that time it has been a saving to me of one-third of the fodder and grain that have been used. Now, if this is the truth of this matter, it must have a very important effect on the values of fodder, the coarse fodders, especially, of which the indigestible portions are greater than those of the finer fodders. Perhaps if "Kit" were to try some salt, or fresh, marsh hay by cutting it and mixing it with the usual ration of feed, he might find the pound of fat or of flesh that he has as yet never been able to lay his hand upon.

H. STEWART.

JOTTINGS.

HOW WILL POTATOES SELL?—"How are your potatoes turning out?" asked a friend, one of our best potato growers, a few days ago. I replied that we had not dug any yet except in the garden, and the yield there seemed fair. Our field crop came up badly from some cause and I have heard the same complaint from others. "It is pretty general!" said he "one of my neighbors had 10 acres, and they came up so badly that he went over the whole piece and replanted and thinks it paid him to do it. I am almost through digging, and find I have not more than half a crop; nor are they so large and smooth as last year. I think this is generally true in my section and I shall be surprised if you are an exception."

I was, of course, somewhat anxious to know whether my friend's surmises were to be realized in my own case, and two days' digging of our early planted seems to confirm his anticipation; the tubers are less in number and more knobby than last year, indicating that the rains induced a second growth. I still have hopes of a better yield from a piece planted June 1, as they made a fine growth of vines, and promised well. If this condition of things prevails to any great extent, prices ought to rule higher than last year.

What are the reports from RURAL readers elsewhere, notably in the great potato sections of the country?

WHAT KIND OF CORN—TALL-GROWING OR SHORT?—A neighbor has just called to show me some corn he is quite elated with. It is a twelve-rowed yellow flint, planted June 5; ripe September 1. The stalks are small, six feet high, the ears averaging 10 inches long and set about eighteen inches to two feet from the ground. Up to the Fourth of July he did not think it would amount to anything, the drought had pinched it so, and it was planted where nothing else would grow; but after the rains came he never saw anything grow so fast. The low setting of the ears renders it less liable to be blown down and the stalk is so small there is little waste in feeding, and it will bear planting closer than our large-stalk and tall-growing varieties, and I am not certain but the yield of grain will be as great. I am not satisfied with the corn I have grown for the past few years; the ears are large, it is true, and so are the stalks—10 feet high, with from four to six feet below the ears; of no use for fodder, though it might do for firewood, but will it pay to grow it for this purpose?

The premiums at our fairs generally go to the big ears and the tall stalks; but it is a question with me whether this is the best and most profitable kind to grow. Even conceding that the large stalks make no greater demand on the soil than the small ones, the yield of grain should be greater to compensate for the extra labor in handling them, and unless the grain increases in the same ratio with the stalks, where is the profit? If I were not such a small farmer, I should like to put in an acre each of eight or ten varieties alongside of each other under like conditions, for the purpose of experimenting on this one point. The reader will say, "Yes, and a mongrel lot of corn you'll have!" True, there would be a good deal of mixing, but that would not interfere materially with the object in view. It is just such experiments as these that would teach us something.

COMMERCIAL FERTILIZERS.—In a recent conversation with a friend on the effects observed from this season's experiments with fertilizers,

I asked if he had seen the analyses made by the N. J. Experiment Station, and published in the RURAL of August 28, and noticed the difference between the cost and estimated values there given. He replied that he had seen and read them, but did not recollect the feature referred to. Reaching for a RURAL, I called his attention to Bulletin No. 5, giving analyses of seven brands of bone, three of which cost more than their estimated value, the most notable of which, No. 31, costs over $16 per ton more than it is worth, while, on the other hand, No 43 is worth $14.25 more than it costs. How many superficial readers of the RURAL would reply as he did: "Well, now! I never understood this before and am glad I have learned something! I shall read these reports hereafter with increased interest." It is always unpleasant to be told we have "paid too dear for the whistle," and equally gratifying to learn that we get more than our money's worth; but it will be remembered that this is the scientific view and the query arises—Is it not possible for the market value of these ingredients to be higher than their actual worth for fertilizing purposes? You perceive that both of these samples are valuable chiefly for their phosphoric acid, as each contains less than one per cent. of nitrogen. It is a question with me whether some soils are as much benefited by phosphoric acid as by nitrogen, or whether those brands in which phosphoric acid largely predominates give as good results as they would if the amount of nitrogen was increased, or whether phosphoric acid alone is as beneficial as when combined with nitrogen, potash, etc., to a greater degree. I have used this latter brand, and, from first to last, a good deal of many others of like character on poor land, and I confess my faith has not been strengthened from the visible results, for I have failed to see the benefits which have been so apparent to my friends elsewhere. The question above all others that needs answering is—Does the use of commercial fertilizers pay? Will the actual and *positive facts* sustain an affirmative answer? If so "let's have 'em;" if not "let's have 'em" all the same. KIT.

Farm Economy.

Poor Cow Manure.

"COMMERCIALS are high; freight on them is higher, and then they are not sure, any way"—so said one of my neighbors the other evening at a little "farm chatter" we were having at my house. "You don't know how to apply them," said I, "and there's where all the trouble arises. Why, you don't even use stable manure, but wade through it knee-deep seven times a day, instead of hauling it out on to your land. Your grain crops are poor, your horses are poor, your cattle are poor, your grass land is poor, your cows are poor, and all your manure is poorer still. What's the use of buying fertilizers till you have put your land in good order with the means you have at home? Fertilizers have no effect on sand, gravel or stones, but strawy manure has. Now first make soil, then you will make crops, then cattle, then manure, then more soil, more crops, more cattle, and as you will make good cattle, you'll make good manure, and so on till the crack of doom—that is to say, daybreak on dooms-day morning, I suppose."

"Well, but I don't want to haul manure till then!" "No matter, somebody else will. You do your duty now or there will be no last man when day breaks. Poor cow manure is a mighty weak article and very slow in its effect on crops." S. R. M.

Reclaiming a Wet Flat.

IN the RURAL of September 4, I notice that A. M. of Bay City, Michigan, inquires about the merits of the mole plow. In Iowa it is worthless as a ditcher or drain-maker. We have a ditching machine here, however, which is worked by two yoke of oxen and cuts a ditch 30 inches deep, 24 inches at the top, and 10 inches at the bottom, making an open ditch, for 20 cents per rod. Instead of plowing his flat, wet land after getting the surface water off in the Spring, I would suggest to him to go over it with a heavy Scotch harrow, giving it a good hatcheling, sow on it Timothy seed and after it is up, turn in his cattle and keep it fed off close. Then sow Timothy and clover and let the cattle tread it. In seeding some wet land here in Iowa, I first burned the old grass off, and after it was free from surface water I sowed Timothy and clover and turned in my cattle and let them eat it and tread it in—I did not even harrow it. Anyone who never saw anything of the kind would hardly believe what progress can be made in reclaiming the land by seeding it in this way. Not only can a good stand of grass be obtained, but a better sod, if the old wild-grass sod is not turned up. This does well here, but perhaps it might not on the marshes of Michigan, but I am under the impression that it would prove satisfactory at least on some of them. J. B. B.

Quasqueton, Iowa.

Pomological.

ARTIFICIAL FRUITING OF TREES.

IN the RURAL of July 24th, W. I. Chamberlain gives an interesting account of Mr. Spaulding's experiments in inducing fruitfulness in trees that would be otherwise unfruitful, by girdling or disbarking. Mr. S. Parsons, in the issue of Aug. 28, gives another method, by incisions at or near the top of the branch to be made fruitful. Both methods as well as many others have been tried, and the best of them practised here for years; still the subject appears not to be generally understood among those who have practised it.

A tree or plant may be made more fruitful in three different ways:

1st. Extra food and cultivation will induce fruitfulness by supplying a surplus of alburnum, which changes what would otherwise be leaf buds into fruit buds. Everybody is supposed to understand this method and it needs no comment from me.

2d. When the vitality of a tree is injured, it will immediately make an effort to reproduce itself by seed. Of this method there are many minor forms or varlations. Thus, greenhouse men cramp the roots of their plants in small pots to produce an extra-large number of flowers; orchardists sometimes bore holes in the trunks of trees that are making a strong growth of wood but do not produce fruit; nails are driven into the trunks, and root-pruning by deep cultivation is also practised for the purpose of forcing trees to fruit; all of which will be successful if done at the proper time; but if continued too long or employed too freely, they will ultimately destroy the tree. When a tree or plant receives an injury shortly after the young shoots have commenced to grow, the growth will be stopped while there is still a quantity of crude and prepared sap in the body of the tree and branches. There is thus a surplus which will change leaf buds into fruit buds. An unusual example of this I saw some years ago:—Mice had girdled an apple tree in June, and, of course, gnawed all the new wood completely off. The growth was stopped, but the tree perfected its fruit, and was alive the following Spring, the fruit buds partially opened, but there was not a leaf bud to be seen. This tree must have received a limited quantity of sap through the body of the trunk—there was no bark whatever.

3d. This method is the principal one we have to deal with, and consists in a partial stoppage of the alburnum from being deposited as new wood, so that the surplus thus formed may be diverted to forming fruit buds. After the bulk of the crude sap has ascended into the leaves and been assimilated, or changed into alburnum, it is then distributed into the different parts of the tree, a portion to form new wood, a portion to support and mature the fruit, "if there should be any," and the remainder, "if any," to form new fruit buds. Now where all, or nearly all, this prepared sap is taken to form new wood, there will be no fruit, but if we by any means prevent a portion of this sap from being deposited as new wood, there will be a surplus which will force fruit buds into existence. These means must be used when, or shortly before, the greatest amount of alburnum is being deposited, and shortly before the proper time for fruit buds to form, or else we shall have nothing but a plentiful crop of suckers, latent leaf buds being rushed into shoots.

The minor forms or variations of this method, that are most successful and most generally used here, are binding a cord or wire tightly around the branch or trunk of the tree we wish to fruit; Mr. Spaulding's method of girdling, "but not disbarking," simply cutting through the bark around the tree or branch "sometimes more than once" just below the point you wish to be fruitful; and pruning and cutting back the young shoots. These will all answer the purpose, and where properly done will never injure the tree. One orchard, now eighty years old, after having been girdled or bound more or less for 30 years, shows no ill effects from the usage. No doubt some of the trees have died, but, if from this usage, their case was something like that of the poor colored woman down South, who died from smoking, at the age of 106.

Yesterday I examined a peculiar phase of artificial fruiting: a Bartlett pear, in the orchard of Mr. W. Carmichael, had been pruned when the young shoots had made a few inches of growth. Very hot weather had then set in for some days; the pruning had stopped the growth of the shoots; the excessive heat had forced the latent buds not only into fruit buds but into blossoms, and there are now two crops of fruit on the single tree—pears nearly ripe and half grown.

Disbarking will not injure a tree if done just as the greatest amount of alburnum is being deposited, unless this new wood is scraped, or dried by excessive heat. I have seen three trees completely disbarked. The first was in the orchard of Mr. John Ferguson, and was a scabby, gnarly tree that had never made any growth. The bark was carefully taken off, from the roots to the small branches; in a couple of hours it was covered by a sap-like froth, and by the next morning this had become more firm. In three days I saw it again, and the new bark was quite firm. Next year it had a crop of apples, and made a good growth, and is now as healthy a tree as any in the orchard. The next tree was one that grew in a fence corner, and was disbarked by using a spade. It also lived, but wherever the spade touched there was a dead spot. The third was disbarked in the morning of a very hot day. No bark formed, and it dried up, but the branches lived for some time.

Where incisions are made in the bark they should be made immediately *below* the part we wish to fruit, as it is the prepared sap we wish to divert, not the crude. I think Mr. Parsons is mistaken in claiming his method as the most logical and scientific, as the girdling is certainly the most successful. If the idea in his method is to divert the crude sap from forming wood, it is a mistake, as it will simply go into other branches or push latent leaf buds into young shoots or suckers. If the idea is to prevent the alburnum from ascending to the young shoots, then all will have to be served alike, which would be a great deal of trouble, and even then would sometimes fail to produce the desired effect, but the young branches above the incisions would fruit.

I have not tried fruiting grape-vines or anything that fruits on the new wood, but some of my neighbors say that it can be done in the same way as apples or pears. In conclusion, I would like to hear through the RURAL from some more of its contributors on this subject, and if I am wrong, I should like to be put right.

Ont., Canada. THOMAS FORFAR.

THE MINER PLUM IN VERMONT.

THIS variety of plum referred to by Mr. Prince of North Carolina, in RURAL of July 31, page 488, is one of the few sorts that are entirely hardy in Northern Vermont. My tree is double the size of Mr. Prince's, and has bloomed full three years in succession, only to have the fruit cut off by late frosts. A few specimens have remained on the tree, but I cannot say they have ripened. Though well colored, they are not soft enough to eat late in October. They are, however, excellent for cooking. We have many garden varieties of our native red Canada plum, that are much larger than the Miner, and some which are better for eating than that is described as being. As these red plums in their wild state are far better than the original of the European plum (the Sloe), and as they show in the garden great susceptibility of improvement, besides being iron-clad against Winter's cold, I have great hopes that we may get something from them soon that will equal the better class of plums from imported stock. The curculio hurts this family of plums far less than the common cultivated sorts. We rarely fail of good crops in favorable years.

T. H. H., M. D.

The Waterloo Peach Again.

I am in receipt of a letter from Charles Downing, in which he denies having written any commendation of the Waterloo Peach. (See issue of Aug. 28th.) I penned the article with the impression—which I still have—that I had seen somewhere the statement that some one had sent specimens to Mr. D., upon which he had bestowed a measure of commendation. My recollection of having seen this is quite vivid, but I am unable to recall the exact circumstances, and inasmuch as this may have appeared without the approval or even assent of Mr. Downing, I take occasion to recall what I said in the article in question, so far as Mr. Downing is concerned. T. T. LYON.

Industrial Societies.

THE NORTHERN OHIO FAIR.

(Rural Special Report.)

THIS large, and in many respects excellent, fair is a private enterprise, managed by a stock company and board of directors. It has so happened for several years that the weather has been anything but *fair* during the days on which this fair has been held. It has rained a part or all of the time. One of the directors told the writer he had a bet of two to one that it would rain every day of the fair this year. He lost his bet—as he hoped to do. The fair was a success.

The grounds of the Association are splendid—the finest but one or two in the country. They are well located within the city limits of Cleveland, and reached by the Lake Shore Railroad, which runs its freight for the fair right into the grounds, and its passenger trains right alongside. The writer attended both the State fair at Columbus, and this at Cleveland, and desires to make no comparisons that are untruthful or invidious to either. The former seemed more clearly agricultural. The show of live stock and agricultural machinery was probably in the aggregate three times as large. The show in both these departments was immense at Columbus, and thoroughly creditable at Cleveland. There were acres of machinery and implements at Columbus, and a really good show at Cleveland. At Columbus there were about 30 portable and traction engines competing and running machinery, and six or eight at Cleveland. There were five or six machines making tiles on the grounds at the former place, and one or two at the latter.

But in its *city* aspects the Northern Ohio fair was far ahead. Cleveland is a much larger city and her merchants, and manufacturers, and florists, and gardeners, and artists, and musicians, and *citizens* take great interest in the fair. The schools close and the children go, and it does them good. The stores and shops close (many of them), and the clerks and employés and proprietors go, and it does *them* good. The grounds are finer, as I have said, and the speed-ring is far better—indeed one of the best in the land. The racing is better, too, and is made a far more prominent feature. The "trotting park" is separated from the fair grounds proper by St. Clair Street, but connected by a bridge. The "Pumpkin Show" is on one side and the races on the other, and the sober-minded needn't cross the bridge. But they *usually do*. They go to show their children the evils of racing! And they can see the whole show. Pools are sold before the races and between the heats at a club house close at hand, and on the grounds in front of the judges' stand. The races are regular races and don't pretend to have a specially agricultural or Presbyterian leaning.

But, on the whole, the fair is good agriculturally, and there is room for it and for the "tri-State," at Toledo, and the "Southern Ohio," at Dayton. They do not serve to injure the regular State fair at Columbus. They are beyond its "suction range," as Holmes calls it, and have constituencies of their own, and the result of their existence will probably be to locate the State fair permanently at Columbus, at least if it receives proper local and railway encouragement there. For there is no real necessity for it to rotate or migrate, with a good and large fair in every corner of the State. There is room for them all. Agriculture cannot have too much stimulus and encouragement. The State Board, too, that has charge of the State fair, has other work, and is just inaugurating a system of Farmers' Institutes for the Winter, and monthly crop and stock reports for the Summer, that will take much time and labor. They will therefore doubtless be glad of the help of independent societies in the exhibition work. OCULUS.

THE INTERNATIONAL SHEEP EXHIBITION.

(Rural Special Report.)

THE erewhile "gorgeous palaces" of the Centennial Exhibition were last week made to serve in a somewhat incongruous association. One who remembers the main building, then grand in its brilliant coloring of new paint, with its crowded aisles and its infinite display of attractive articles, but now dingy with dust, neglected and deserted, can scarcely help the wish that all that magnificence had disappeared as swiftly as it arose, as a passing fairy creation, leaving its brilliance fixed upon the mind as a pleasant memory, rather than to see it once more in its present condition of decay and helplessness. The sheep exhibition, although a decidedly useful thing, did not seem in place there, and the shrill bleat of the diminutive Merino mixed with the sonorous bass of the huge Cotswolds and Oxford-Downs, by no means mingled harmoniously with the rattle of a grand piano at a near-by music stall, and the pealing of the large organ in the distance. So the rough wooden pens of the sheep, the odor of trampled cabbages, and the long-drawn-out arrangement of the exhibition stalls around two sides and one end of the vast building, dwarfed into very inconsiderable proportions what would have made a creditable display elsewhere. "To what base uses may we not return?"—But, not to criticise a good thing too closely, "let us return to our muttons."

This exhibition was intended to be international; but the international part was absent; unless an enterprise belonging to several of the Sovereign States may be held in a sense to be international; or it may be the new arrivals from a foreign country shown by an enterprising importer may furnish an excuse for admitting that it was truly international. But it is a beginning, and as such was a good one. The energetic and capable Agricultural Commissioner, General Le Duc, has been a moving spirit in this enterprise, and to him the duty of opening the entertainment was entrusted. The Commissioner has the true idea of the importance of this interest to a nation which uses 250,000,000 pounds of wool, and possesses unexcelled facilities for producing twice this quantity, and yet imports one-fifth of it, thus

failing to supply its own wants. In his opening speech he remarked:

"Our country is capable of growing any and every grade of wool that may be called for in the manufacture of any and all fabrics, and in such quantity and so cheaply that, instead of importing, we should have such quality, surplusage and price as to command the markets of the world. I have seen recently hundreds and thousands, yes, hundreds of thousands of acres of land in the hilly and mountainous regions of Virginia, North and South Carolina and Colorado that are admirably adapted to the raising of sheep, and where the "tread of the sheep would be golden" to the wretchedly poor farmers, who barely live by the cultivation of the worn-out hillsides of a country whose healthy and temperate climate, fine water and bright skies should attract immigration and capital to engage in the production of wool and mutton. If, as I hope, one of the results of this Convention will be to increase largely the breeding of sheep in these regions, I will feel richly compensated for any work or assistance I may have rendered to the gentlemen who have projected and executed this plan of an international sheep exhibition."

The sheep exhibited were of remarkable excellence, consisting chiefly of the three most valuable varieties for our uses: viz, the American Merino, the South-Down and the Cotswold. There were Hampshire-Downs, Oxford-Downs, Shropshires and Lincolns in lesser numbers, but in no way of less excellence. With two exceptions the lots exhibited were native-bred, and proved beyond a doubt that America may be made a "sheep's paradise" if the shepherds only do their part well. It goes without saying that the Merinos were all that could be wished, for to see a poor or ill-conditioned Merino at an American exhibition is the rarest sight. This sheep is modest and homely, but it bears a true golden fleece, and the beauty of its wool, when the dark and unattractive surface of the fleece is carefully spread apart, never fails to delight even the non-professional beholder. A good flock of these sheep was shown by Mr. Hammond (a historic name), of Middlebury Vt, who took a pardonable pride in explaining to every inquirer the nature of the prominent wrinkles upon his excellent rams, and the fineness and curl of the wool. This sheep, being cosmopolitan, it was not surprising to find flocks from Illinois and Missouri and the Northwest, as well as from Pennsylvania, New York and Vermont.

The South-Downs were represented best by a remarkably good flock, sent by Samuel J. Sharpless, of Philadelphia, and another owned by R. M. Fisher, of Danville, Ky. Mr. Sharpless's South-Downs were in excellent health and hardy, and had evidently come direct from his pasture. Of his large flock not one specimen could be objected to as undeserving of the honor of competing with the best. Mr. Fisher's flock showed how well this noble sheep can match the no less noble Blue-Grass fields of Kentucky. They were heavy, broad-loined, smooth-built sheep, with a fleece and make-up that required no odds in comparison with the new arrivals from Lord Walsingham's flock, shown by Mr. Cooper, of Pennsylvania. These imported sheep always carry to me the idea that they were last seen in a barber's shop, and under the shears and manipulation of the "tousorial artist"—an appearance which they soon lose after their introduction to our more rough-and-ready management. As a sample of what the South-Downs can do under trying circumstances, a flock which had been sent to the Philadelphia House of Correction, was brought from that institution and looked well, notwithstanding the association.

A flock of Cotswolds from Illinois was shown by Mr. Abner Strawn of that State. These were magnificient sheep in no way gotten up for show, but in working order, and were no new importations, thus showing that this sheep does not, or need not, go back upon us in our climate. A fine ram with good, blotched face and legs and a fleece 11 inches in length, turned the scale at 340 pounds, and good feeding might easily add 50, if not 100 lbs. more to his weight. It was a matter for regret that some other fine flocks of American-bred Cotswolds were not present to compete with Mr. Strawn. A few Hampshire-Downs and Shropshires were shown by Mr. W. Homeward, of Newark, Del. These were fine specimens of these sheep, which are desirable for those whose business is to supply the markets with early lambs. The recent importations of Oxford-Downs by Mr. T. S. Cooper, of Pennsylvania, showed mostly what could be done by English breeders with these sheep. This was the international feature of the exhibition, or at least all that could be seen of it unless a *sheep baiting*, as it might be called in point of fact, outside, with some dogs called sheep dogs, were to be considered as the foreign element. These imported sheep were monstrosities of fat and feeding, and a mild protest might be gently given against the mistake of importing such sheep merely to take premiums at shows. Why should it not be possible that premiums could be competed for only by native-born sheep? And why should an importer and dealer in sheep or live stock be rewarded for the possession only by purchase, of sheep fatted for exhibition in another country, where it is well known that the course of feeding is destructive of the only value for which these animals are supposed to be brought hither. To be enormously fat is no merit in a sheep; not even for the butcher; it may be for the oleomargarine dairymen; but for no earthly use besides, unless for the soap boiler or candle maker, and these people as yet have not got so far as to offer prizes for fat.

In a ring, outside, the visitors were offered a novel entertainment, which in future would certainly be more honored in the breach than the observance. It was supposed to be a trial of sheep dogs and had as much similarity to the genuine article as the chasing of the wild, untamed Texan steer in the streets of New York City has to a real Spanish bull fight. Five sheep were let out of a pen along with a dog, with the expectation that the dog should drive the sheep around a ring like a half-mile track, and into another pen near the starting point. The trial was a failure. The sheep were not the kind to be driven, and the dogs not the kind to drive. The result was ludicrous, and in a circus ring would kill the clown with jealousy. One dog, after scattering his sheep scared one out of the inclosure through a window into the exhibition building, where the poor animal (the sheep) went, consistently enough, into the Secretary's office for protection, and to have its wrongs righted. Another dog, after chasing the sheep back and forth, lay down; and one sheep, evincing the greatest sagacity, spied the open pen and walked into it of its own accord. The truth is, we don't want shepherds' dogs yet in America, excepting on the plains to guard against wolves and to bring in stragglers; and there we have dogs to the business and the manner born. This international feature of sheep-dog trials we can dispense with in future, or at least, until we possess those kinds of sheep that need dogs to drive them, as the half-wild mountain sheep, fleet as deer, that carry little weight of fleece to hamper them in a race with a dog over brush and rocks, and through briars and heather where a man could not follow. The dog truly has his place among sheep; but at this exhibition he was as much out of place as those curs which do more to prevent sheep-keeping than all other obstacles combined. A genuine sheep dog trial would be an interesting exhibition; but it wants, for success, a well trained dog, a capable shepherd, and sheep that have learned to know the dog as a companion and not as an enemy to be feared; lastly, it needs the right thing in the right place. TREE PROTECTION.

S. B. PECK.

THAT trees are a protection is beyond dispute. They protect from the cold of Winter and the heat of Summer; and cold, hot, inhospitable and songless of birds is a country without them. They bear seeds, fruits and nuts for the birds and squirrels that delight us with their music and their gambols, as well as delicious fruits for the pleasure and health of man. "Woodman, spare that tree" is the sentiment of every lover of nature.

But the manner in which they protect us is not always well understood. It is often supposed that they protect vegetation in the same manner in which they protect us and our animals; but this is not so. Winds cool our bodies, but they are not necessarily cold in themselves, and whether they sink or raise the mercury in the thermometer depends on whether they come from a colder or warmer region than that surrounding the instrument.

Every live animal is a constant generator of heat, always giving it off to the surrounding air; winds dispel this heat and thus cool the air around us. Trees and other vegetation, though they have the effect to shut off this wind, yet do not, like animals, generate heat, but in Summer absorb heat in sunshine by the constant evaporation of water through their leaves, and also by shutting off the scorching rays of the sun from the shaded space around them.

Trees, valuable as they are for protection, do not protect our plants from frost except in a vertical line under them; on the contrary, they, as well as everything else that obstructs the free circulation of air, favor frost.

Every farmer of any experience knows, whether he is able to explain it or not, that inclosed valleys are always more subject to untimely frosts than level plains, and *they* more so than side-hills, the latter often being uninjured when in all other aspects tender vegetation is killed. He is slow to learn, however, that any protection against wind has in a measure the effect to produce this dreaded enemy to horticulture, most especially to the raising of fruit. Time and space forbid a full explanation here of the cause and effect of frost; suffice it for the present for me to say, that always, except in extreme cases, killing frosts occur only on still nights, or rather on early mornings, and that anything that disturbs this atmospheric calm tends to prevent frost. Sloping aspects produce currents of air, by the fact that the atmosphere, as it cools after sundown, becomes heavier, and thus, like water, seeks the lowest ground, and crowds the air of the valley up the slopes. During sunshine the earth is heated up rapidly by the rays of the Day God, but as soon as he disappears this accumulated heat passes directly upwards, but any shade, like fogs, clouds or smoke, prevents this upward flow of heat and thus hinders frost, while winds or currents of air have the same effect by *disturbing* this upward flow.

If I have made myself understood by this brief attempt at explanation, and have thus taught some one the value of a due selection of aspects for all frost-fearing fruits and tender vegetables, my object will have been accomplished. That this part of the science of horticulture is partially ignored by the average country farmer, as well as by many pomologists, I have daily evidence, both by observation and by reading the printed remarks of many on this subject of tree protection. I would by no means discourage the leaving or the planting of trees for protection or ornament, but the right selection of the place in which to plant them or our fruits requires deliberate consideration.

Those who have access to the annual reports of the Michigan State Pomological Society will see the effect of tree protection as there reported in the reports for 1874, page 133, and for 1877, page 302. In both cases peach orchards were evidently destroyed by protection.

Muskegan Co., Mich.

The Apiarian.

BEES.

ANYONE in the country, however limited his space, can keep bees at a considerable profit, for it must be recollected that they have the whole region round them to roam in and freely forage for honey, no matter to whom the land belongs. Thus those who possess the fewest acres are just as well off for bee pasturage, as those who possess the most.

Think of the hundreds of fruit trees within a circuit of a few miles around nearly everyone's habitation, whose numerous early Spring blossoms invite all the bees of the neighborhood to come and sip their nectar freely and without price. Then, there are thousands of wild flowers; and, soon following, millions of white and red clover heads; the blossoms of grain, of peas, of beans, and other things during the Summer, which the eye of man does not note, but the acuter one of the bee does.

Then in Autumn there are fields of buckwheat, and wild flowers still linger in abundance. What treasures all these combined are for this highly intelligent and ceaselessly laboring little insect to draw from for the gratification and sustenance of man, the sweet treasures of all of which, except for these busy little creatures would go to waste.

As soon as cold weather has set in, hives can be safely removed to any reasonable distance. Let every one who is now destitute, possess one, at least of these, and as many more as can be well attended to. Women are just as capable as men to manage bees, or even more so, as they have a gentler hand, more patient disposition, and, we may add, a better tact for the pursuit of this light and pleasant home industry.

If instruction is wanted in the management of bees, plenty of cheap books on bee-raising are published, and the RURAL during the year has frequent articles on the subject, and is always ready to answer all inquiries with regard to this pleasant business.

Miscellaneous.

GLEANINGS.

Encourage the Use of Cheese.

IT is a duty every public writer, or speaker, and the press generally owe to the agricultural interests and citizens of the country, to urge upon the public an increased consumption of cheese. Our facilities for dairying in the great northern belt of the grass States, in the elevated and rolling regions of the middle belt of States, and in the mountainous sections of the far West, the South and the Pacific Slope, are practically inexhaustible. Dairying is like an engine that furnishes motive power to itself—it is capable of building up the lands which support it. It is a branch of farm industry that will not only give us immense quantities of cheese, a food hardly second to any in its cheapness, excellence and economic value; but indirectly it will give us immense additions of veal, pork, butter and beef. If the home consumption of cheese can be so stimulated as to keep a constantly increasing demand for it so as to keep dairying constantly and rapidly expanding over those wide areas so well designed for it, keeping pace with our rapidly growing population, it will indeed be a national blessing, and an object well worth laboring for by those who would form, guide and direct public opinion, taste, habits and modes of living. There is no article of equal value as food whose consumption needs to be more encouraged, or which would do so much real good.

The Lesson of the Year

agriculturally from the deep, sharp long-continued drought, is deep, thorough, frequent cultivation. A rich, friable oft-stirred soil will stand the drought much better than one of opposite characteristics. The lesson of a wet season is the benefit and necessity of drainage. There seems to be a happy mixture, kind, and condition of soil that is neither too wet nor too dry; that sustains itself amid wet or dry influences of the seasons, and, properly handled, always liberally responds to the demands made upon it, and gives good crops without much regard to wet or drought. But we have great quantities of soil not of this happy consistency and component make-up, that can and ought to be mechanically and artificially improved by draining, impacting, admixture or fertilization. This is a gradual work, and one the farmer must do by regular siege approaches rather than by a single dash or charge. It must be the outcome and crowning work of years, a little here, a little there, by good calculation and economic plans slowly, persistently surely carried out. This will be for true and lasting agricultural progress.

A Criterion of Agricultural Skill.

About as good an index as one can have by which to judge of the State of agriculture in a town, section, country or State, and especially of any farmer, is the success, extent and quality of the wheat crop produced. It requires, except on virgin soils of great richness and full of the elements of plant growth, skill, judgment and good management to raise good crops of good wheat. Those farmers, as a rule, in our older sections are the most prosperous who plant, cultivate and produce the most wheat and corn. I am not talking of dairy, trucking or fruit sections or farmers, but more particularly of the great mixed farming sections of our country. Wheat is a plant of delicate tastes, peculiar in its likes and dislikes, and one that will not bear neglect in any respect. It must, more than most plants, have its likes administered to and its enemies and adverse conditions beaten off, to do well. Wherever good wheat can be produced, the highest type of farming will be found necessary to, and employed in its culture. The flour made from it will be the material most used in making the bread of that community. The more advanced in civilization a people become the better they live, the more flour, sugar, meat, and improved vegetables they will use; the better their stock and domestic animals will be fed and cared for, and the more all will enjoy life.

The Percheron Horse

stands among the first of the business breeds of horses. He has been bred for business for so long a time that his characteristics have become firmly fixed and are sure of successful transmission. He has become a thoroughbred in the fullest sense of the term and as a thoroughbred business horse has attracted, and is now attracting, the attention of all civilized nations, and especially of the United States. While the undue encouragement given by Agricultural Societies and public attention to trotters and speed horses, has directed the aims of the farmers and horse breeders to a wrong standard and in a wrong direction, we see many signs of reaction and of a return to the breeding of more generally useful and intrinsically valuable draft, farm, truck and business horses. The Percheron horse is called in to aid in this reform, and is sure to leave much of his mark for good in wide circles from the points where the best specimens are kept for breeding purposes. J. W. LANG.

REMDY FOR WARTS.—W. B. R., Medina, N. Y., says that a simple remedy for warts on animals is the application of muriatic acid. Small warts can be be safely cut from a cow's udder, and killed by a drop of muriatic acid applied with the point of a small stick. He has also removed flat warts the size of a 25c. piece from the inside of a horse's leg by carefully scraping off the top and applying muriatic acid in the same way.

BRIEFLETS.

THE White Elephant Potato ripens a few days after the Late Snow-flake. The latter is quite uniform in size, smooth, beautiful. But the W. E. will yield three times as much and, though not distinguished for beauty, is just as good in quality. . . . . Mr. Ricketts brought to the RURAL Office last week eight or ten bunches of his seedling grapes. Nobody supposes that his many kinds will do well everywhere. But it begins to appear that those

thus far offered for sale, will thrive in *some* places. Well, if there is but one chance in 20 that such beauties as Lady Washington or Excelsior or Jefferson would do well—we should take the risk. We are having several of the kinds left by Mr. Ricketts engraved for our readers. . . . . Dr. Bailey, of Winning Farm, does not reply to our charges against him. . . . . We are sowing over 50 varieties of wheat. . . . . Chester County Mammoth Corn is well named. We pulled one ear a few days since that measured 13½ inches in length, with 20 rows and 60 kernels in a row—making 1,200 kernels. No doubt there are larger ears than this in the field. It requires about the same length of season as Blount's. Both are now (Sept. 18) nearly ready to cut. . . . . We have bushels of cow-peas. What better proof is needed that they will ripen in this climate? . . . . . The cost of the plain paper alone upon which the Fair Number of the RURAL NEW-YORKER is printed will be, when completed, $3,300, in round numbers. . . . . But the compliments the Fair Number has thus far received are worth to us more than tongue can tell! . . . . . Honest words of praise are ever gratefully received. But we hope our friends will criticise the RURAL with entire freedom. How can we hope to improve it if they do not tell us wherein we could please them better? . . . . The pear Louise Bonne de Jersey is now in the fruit markets in large quantities. This is a showy pear with its red bronze cheek. But often there is an astringency about it and a thickness of skin that are not agreeable. This is one of the kinds that do well on the quince. . .

CATALOGUES, ETC., RECEIVED.

JOHN SAUL, Washington D. C., Descriptive catalogue of Dutch and other bulbous flower roots. Hyacinths, Tulips, Narcissus, Crown Imperials, Irises, Crocuses, Snow-drops, Anemones, Ranunculus, Scillas and Lilies.

BARR & SUGDEN, 12 and 13 King St., Covent Garden, London, W. C., England. One of the most complete catalogues of Spring bulbs published.

"How to Keep Boys on the Farm," by Geo. D. Hunt, Salem, Ohio, a little book of 48 pages. Price 20 cents.

GEO. S. WALES, Rochester N. Y., Catalogue of all small fruits—shrubs, vines, roses. Sent gratis.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.

VIII.

THE following samples of fertilizers are from the stock intended for this year's use. They have been sent in by farmers and dealers, and are now, September 4, just completed:

BONE MANURES AND PHOSPHATES.	52.	56.	57.	60.	61.	64.	67.
Nitrogen in organic matter.....		2.80	2.36	2.15	.75		5.30
Phosphoric acid, reverted.....	4.91	.83	....	....	....	8.43	....
" insoluble.....	14.43	2.24	....	....	....	3.88	....
" total.....	....	1.28	16.70	27.46	....	13.86	....
Potash.....	....	....	....	....	20.38	....	....
Estimated value.....	$23.27	8.87	28.64	29.56	45.05	36.18	....
Cost in market.....	$23.00	14.00	33.00	35.00	45.00	45.00	45.00

52. Orchilla Guano. From Summerill & Hires, South Penns Grove, Salem County. In very good condition.

56. Rotten Bone. Manufactured by G. W. Baker, Williamsburg, L. I. From stock of Azariah Dunham, Metuchen.

57. Corena Settlings. Made by Geo. W. Baker, Williamsburg, L. I. Sampled and sent by Azariah Dunham, Metuchen.

60. Raw Bone. Manufactured by Thompson & Edwards, Chicago, Ill. Sent by J. W. Pancoast, Sharpstown, Salem County. In good condition.

61. Pure Fine Ground Bone. Manufactured by Thompson & Edwards, Chicago, Ill. Sampled and sent by J. W. Pancoast, Sharpstown, Salem County.

64. Atkinson & Pettit's Phosphate of Potash, Philadelphia. Sampled and sent by Wyatt W. Miller, Salem. N. J. In good condition; like fine ashes.

67. Pure Bone Phosphate. Manufactured by J. S. Yarnell, Medla, Pa. Sampled and sent by I. W. Nicholson, Camden.

SUPER-PHOSPHATES.	53.	58.	59.	63.	65.	66.
Nitrogen in organic matter.....	3.20	.95	1.32	1.49	1.11	2.05
" as ammonia.....	....	....	....	.57	3.17	....
Phosphoric acid, soluble.....	2.60	....	.42	....	3.03	6.87
" reverted.....	3.69	2.40	3.48	.71	2.46	2.08

Cost in market.....	35.00	35.00	36.00	17.00	48.00	38.00

53. Swift-sure Fertilizer. Manufactured by M. L. Shoemaker & Co., Philadelphia, and sold by Enoch Dudley, Moorestown. Sampled and sent by Joshua R. Evans, of Hartford, Burlington County.

58. Dissolved Bone Meal. Manufactured by Thompson & Edwards, Chicago, Ill. Sampled and sent by J. W. Pancoast, Sharpstown, Salem County.

59. Ammoniated Bone Superphosphate. Manufactured by Thompson & Edwards, Chicago, Ill. Sampled and sent by J. W. Pancoast, Sharpstown, Salem County.

63. Ammoniated Phosphate. Manufactured by G. W. Baker, Williamsburg, L. I. Sampled by Azariah Dunham, Metuchen.

65. Lobos Peruvian Guano, from stock of S. A. Willetts, Haddonfield. Sent by I. W. Nicholson, Camden.

66. Raw Bone Phosphate (Plow Brand). Manufactured by Walton, Whann & Co., Wilmington, Delaware. Sent by I. W. Nicholson, Camden. GEO. H. COOK, Director.

New Brunswick, Sept. 6, 1880.

Everywhere.

RURAL SPECIAL REPORTS.

ALA., Sand Spring, Limestone Co., Sept. 13.—In the RURAL Fair Number I see W. H. Watkins, N. Y. asks, in Querists' Department, "What State in the South is best adapted to sheep husbandry, and what part of that State?" I would like to say, through the RURAL, to W. H., or any of its numerous readers, that Northern Alabama is a good place for sheep husbandry, and anyone wishing to go into that business would do well to come and see this part of Alabama. In this township, the northeastern corner of Limestone Co., there are no high hills or swamps; the land is rolling, with plenty of fall to carry off surface water, while there are good soft-water springs and brooks. The timber is principally oak, but there are chestnut, poplar, hickory, beech, black and sweet gum, dogwood, and persimmon, and a large growth of wild grass all over the country where not cultivated, on which stock of all kinds feed and get fat in Summer. I have seen sheep live all Winter here in the woods without any food whatever except this grass and what they could browse from low bushes; but, of course, it was a poor living. The country is new in point of improvements, though there are some settlements 75 years old in the vicinity. Within the past two years over 20 Northern families have settled in this township, and there is not a negro living in the place. The west line of the township is five miles east of the Louisville Nashville, and Great Southern Railroad, and the North line joins Tennessee.

I came from Northern Indiana here two years ago last Spring, and have had better health here than there. Improved land sells at from $2 to $10 per acre, and there is considerable goverenment land at $1.25 per acre, or it can be taken up under the homestead law. The wheat in this and adjacent counties was a failure this year on account of the rust, but the cotton, corn, sweet potatoes, and cow-peas are good. Apples, peaches, pears, plums and grapes do well here when properly attended; but they have been very much neglected since the war. Clover, Timothy, Red Top and Blue Grass do well. Wheat sells at $1; corn, 35c.; sweet potatoes, 50c.; cow-peas, 75c., cotton, 9½c.; butter, 15c.; eggs, 10c.

WARREN MASON.

CANADA, Belmont, N. S., Sept. 10.—Hay crop better than last year; wheat, not so good—weevil-eaten; oats, fair to good; barley, an average; buckwheat, ditto; potatoes, very good, no bugs or blight. Roots of all kinds are suffering from drought; we have had no rain for three weeks. The Golden Mangold keeps ahead of all others. Pearl Millet and cow-peas are no good for this place. L. D.

DAKOTA, Herman, Lake Co., Sept. 11.—The prairie here is very rolling, with many natural meadows, but no wet depressions. There are several pretty lakes, all supplied with fish. Antelopes feed along the streams. Wheat was a splendid crop; but oats were a complete failure hereabouts, owing to rust. Corn is poor; but potatoes are fine. The country is too newly settled yet for fruit, as most of the settlers have come here within the last two years. S. S. S.

FLORIDA, Starke, Bradford Co., Sept. 13.—The storm mentioned in my last proved much worse in the counties south of us and on the Gulf Coast than here. In this county the loss on cotton is estimated at 25 per cent. In Leon county to the west of us there will be a loss of 600 bales. They raise a short staple in all the southerly counties and the loss there must be very heavy. In Orange, Volusia, Sumpter and Brevard counties, the loss on the orange crop is fully 50 per cent., the heavy wind having blown the fruit against the long thorns with which the trees are covered, and injured them so that they will drop off before they are ripe. The weather is now very warm with frequent showers. I. S.

ILL., Champaign, Champaign Co., Sept., 10.—Heavy rains on the night of 1st, and rains equally heavy with a great deal of thunder, lightning and wind, on the afternoon of the 3rd, have put an end to the drought, and put the soil to soak in fully six inches of precipitation. Preparation for Fall wheat seeding will now go on with a rush, and pastures and meadows will resume their wonted color. B. F. J.

IOWA, Davenport, Sept. 12.—Business is very lively here, although late rains have made the roads very muddy, so farmers have not brought in their produce as lively as they would have done had the roads been in not so bad a condition. We have had a bountiful harvest, however, and the country is full of grain, and that of a good quality. Corn looks splendid, and bids fair to be the finest crop ever raised in this country. The following are about the ruling prices:—Wheat firm, with an average demand; No. 2 Spring, 85@90c.; barley, 55@66c.; oats in demand at 27@28c.; corn in demand at 32@35c.; flour, from $5.60 to 8.10; butter, 20c.; eggs, 10c.; onions, 65@70c.; potatoes, 30@45c.; apples, 50c.; grapes—the market is overstocked at 2@3c. per lb. G. W. S.

KAN., Everett, Woodson Co., Sept., 11.—We have been having quite heavy rains of late and the ground is in fine condition for sowing Winter wheat and there has been a considerable area sown already, and other farmers are busy getting ready to sow. Nearly all of the corn in this vicinity has been cut for fodder. It did not ear well on account of the dry weather. Fruit is plentiful and cheap. Apples are selling at 40c. and 50c. per bushel. Potatoes are good but not a heavy yield. J. J. D.

MICH., Lichfield, Hillsdale Co., Sept. 13.—Well, the Blount corn is not all dead yet. I had two patches planted, the first on April 21, the other on May 6. All is ripe and cut, and some husked out. I cut two stalks, with four ears on each, which weighed 11 pounds, measured 13 feet—six feet 10 inches to the top of the lower ear, and nine feet 11 inches to the top of the upper ear. All were sound; but I find it was planted too thick to do well. I think we have to learn how to plant and cultivate this corn in order to be successful and raise a good crop. I also had two different kinds of white Ohio Dent, two kinds of yellow Dent, and two kinds of speckled Dent. One of these I got up by mixing three different kinds of corn together. It is a great improvement on all. I also had six different kinds of Flint or eight-rowed, called Smut-nose, Large White Flint, Yellow Eight-rowed, Large Red Blaze, and the Improved King Philip. The kinds best adapted to this country are the White Ohio, Yellow and Speckled Dent, and all the flinty or eight-rowed sorts. The cow-peas are getting ripe. I find three different kinds, one a light brown, one a speckled, and one a jet black—a very nice bean. We have had a season very favorable to the growth of crops. Wheat was a fair crop. Corn is coming out well. Potatoes are good. Apples are plentiful, so that they are selling for from 25 to 50 cents a barrel. Pasture is abundant at this time. G. K.

MISSOURI, Carthage, Jasper Co., Sept. 19.—This has been one of the most propitious seasons for the farmers ever known in this section of Missouri. Our wheat crop was very large, averaging from 10 to 30 bushels per acre. Corn is nearly always good and this year it is better than the average. Potatoes have done remarkably well, while oats have been rather above the average. The drought which prevailed in Kansas did not extend to Missouri. We are now suffering with a cattle plague which is making sad havoc among our herds. The writer has lost 32 head out of a herd of 100, while others have lost a greater percentage, some losing four-fifths of their number. One dealer has purchased 4,000 hides since June 1st. Some think it is Texas fever while others call it murrain. As soon as taken, cattle begin to droop their heads and ears, stop eating, have some fever, leave the herd and try to be alone. Their water becomes of a dark color and frequently their stomachs become perfectly dry. Milch cows dry up immediately after being taken, and nothing seems to cure them if severely affected. W. H. P.

MINN., Howard Lake, Wright Co., Sept. 11.—We have had very good crops, in general, of cereals, fruits and vegetables of all sorts raised so far north. There has been a little diminution in the yield of No. 1 wheat owing to long-continued rains while a good deal of the wheat was left in the shocks awaiting to be thrashed, in order to avoid the labor of stacking. This shocked wheat sprouted sufficiently to reduce its grade from No. 1 to No. 2. There was scarcely any No. 3, however. Some was not injured at all, and all of it was better than was expected. Within a few miles of this place a hail storm toward the end of August did much damage to the crop, some having lost all their wheat, owing to its being completely riddled by hailstones as large as an egg. The storm did not extend as far South as this place fortunately. Wheat is worth here 70c per bushel; corn, 50c; beef steak, 8 to 10c. Wild plums are abundant and delicious. Wild cranberries and grapes are now ripe and abundant. S. A. M.

NEW JERSEY, Tom's River, Ocean Co., Sept. 12.—The cranberry crop is unusually early. Picking began here on Sept. 5. There have been less scald, insects, and other causes of injury than usual. The average crop will be pretty fair. A. W. A.

N. Y., Syracuse, Onondaga Co., Sept. 17.—The last six weeks have been rather cool. Slight frosts occurred on the 16th and 17th ult. and again some days since, only notable as showing a difference of 60° in the temperature of a single day. Of all the farmer's staple crops, hay sustained the most injury. There is a large acreage of corn in this section, and I never saw it look so well. It has been mostly cut up and stooked. Of fruit, strawberries were most deficient; grapes are plentiful and hardly pay for cultivation. The most enormous crop of apples ever produced load the orchards this year. Not a third of them will be used for any purpose. A large sowing of wheat will be made in this county this Fall; the new fertilizers which are extensively used, rendering crops of 30 to 40 bushels per acre reasonably certain. ONONDAGA.

N. C., Lynn P. O., Polk Co., Sept. 10.—The season has proved more moist than is usual here. This affected the corn crop very favorably; but not so with the fruit, the rain and the natural ripening process caused many peaches to fall, which, if not used at once, are of no value. Pears are doing well just now. The Bartletts are very large and sweet. The Seckel and other small varieties are just coming in. The cotton crop is good, just opening; too much rain causes the plant to "shed" its fruit as the blossom falls. Flour and meal are lower in view of a good coming crop just in sight. The superior and abundant crop of fruit on the Thermal Belt of Tryon Mountain, has induced quite a number of men of capital to examine the situation this Summer and the result is, a large fruit farm is to be planted out at once—2,000 pear trees, 2,000 peach trees and other fruits. The land was bought for $8 per acre. The same parties propose to try the strawberry as a crop for the Eastern markets. Ordinary varieties mature on the South side of the mountain early in April. L. R. M.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Queries about Fertilizers.

L. D., Belmont, N. S., asks 1, whether oat and buckwheat hulls are of any value for manure; if it would pay to haul them two miles, and which would be the better plan—to compost them with black muck, lime and potash, or to use them for bedding; 2, are leather cuttings and scraps from shoe factories and tanneries and the waste of wool from woolen factories of any use for manure; and if so, how should they be used for that purpose; 3, would a liquid of lime, salt, potash and water be a good fertilizer, and in what proportion should they be mixed.

ANS.—1, Oat hulls are excellent feed and too valuable to be used for manure. The writer has found them to increase the milk considerably when fed in place of good hay. It would certainly pay to haul them two miles. Buckwheat hulls may be thrown into barn-yards and will be useful as an absorbent, but are in-

jurious when used as bedding for animals on account of the readiness with which they heat when packed closely. They are charged with making pigs scurfy and mangy, and we believe the charge to have some truth from unfortunate experience. They may be composted with black muck and lime very usefully. 2, Leather scraps and wool are rich in nitrogen, but require time for their decomposition. They are best used by plowing them in under a shallow furrow. Wool waste is remarkably effective as a fertilizer for hops. 3, Lime, salt, and potash, may be used as well dry or separately, as dissolved or mixed. Nothing is gained by mixing or dissolving them. Lime may be used at the rate of 25 to 40 bushels per acre; Potash, in the shape of potash salts, 400 to 600 pounds, and salt in the same quantity.

Rendering Bones a Quick Fertilizer.

W. M. C., Glenwood, Utah, says that crude soda is plentiful in that section, and the bones of dead animals are a nuisance from their abundance, and he asks whether if they are boiled with caustic soda or potash—as is done in making home-made soap—the nitrogen and phosphoric acid in them can be reudered a profitable fertilizer.

ANS.—Bones cannot be prepared in a fit condition for a fertilizer by boiling them with potash or soda. The soda or potash here referred cannot be caustic. Caustic soda or potash is free from carbonic acid, by combination with which it is made mild. Soda or potash is made caustic by treating it with caustic or newly burned lime, which deprives it of carbonic acid. It does not exist naturally, as it has an affinity for carbonic acid and water which it draws from the atmosphere, and returns to a mild or carbonated state. There is no practical way of reducing bone to a powder and saving the nitrogen, except by grinding. The bones may be softened in small quantities by placing them in layers with fresh wood ashes and keeping the heap moist for some months; or they may be treated by sulphuric acid and made into superphosphate. But this is troublesome and dangerous to unskilled persons. The best plan is to burn the bones and reduce them to bone ash, which contains all the phosphate of lime, the nitrogen being lost. But of this very much can hardly remain after the long exposure to which the bones must have been subjected.

The Rural Branching Sorghum.

R. M. P., Brockport, N. Y., asks, 1, where can he procure enough seed of the RURAL Branching Corn to sow an acre; 2, how much seed would be needed for an acre; 3, will it mature in that section; 4, where can he get roots of Prickly Comfrey.

ANS.—1, You cannot at present purchase the seed of the Rural Branching Sorghum. Whether it will be offered for sale next Spring or not depends upon the crop we are now having grown for us in South Carolina. 2, We have not estimated that exactly. A very small quantity will suffice for the reason that it should be sown in drills one seed to every two inches, and the drills four feet apart. As soon as it appears above ground, the plants should be thinned out to 18 inches apart. It so resembles Finger and other common grasses at first that the seeds should be sown far closer than they otherwise would need to be, to insure a good stand. 3, Seed matured with us last year, though quite destroyed by sparrows. We may say that it will require an unusually long and favorable season in your climate. It seeds so abundantly, however, that, when generally cultivated, as we have little doubt it will be, seed should be sold as low as wheat, which, considering the small quantity needed per acre, would render the cost of seed a mere trifle. 4, The sets (roots) are sold for 50 cents per pound by most of our leading seedsmen.

New Seedling Grapes.

S. V. S., Syracuse, N. Y., says: "For some years I have been engaged in the effort to improve the quality of our native grapes by raising new varieties from the seed. Out of several hundred seedling vines fruited I have selected two as possessing sufficient merits to entitle them to a place in the list of cultivated varieties. At the suggestion of Messrs. Smiths and Powell, nurserymen of this place, I venture to send you by express a sample of each kind and to ask you for a candid expression of opinion in regard to their merits. While I consider them very good, I fear I am naturally biased in their favor and therefore not altogether a good judge. The vines have proved themselves to be both early and hardy."

ANS.—When those who send us grapes or other fruit do not write their initials or names upon the boxes, we are not always able to identify the packages they send. The box which we presume S. V. S. sent to this office, contained two kinds of grapes—white and dark red. They are very much alike in size and quality. Tender pulp, sweet, rich—rather foxy; skin a little soft. Unless these grapes are remarkably early or productive, we can hardly advise our friend to propagate them. There are too many others which are as good.

Quince Culture.

O. W. F., Blackstone, Mass., asks for an article on quince culture, telling the best manures to use, the time to set out the quinces, the best location, and kind of soil, etc., with full particulars from the time of planting to the gathering in of the fruit.

ANS.—It would be best for you to propagate by bending branches down in the Spring under the soil, leaving a few buds out. Such layers will usually root by Fall when they may be cut from the main stem, and be transplanted. Or, you may procure cuttings a foot long and plant them now. Cover with earth so that only a quarter of the cutting will be left aboveground. Press the earth *closely* about the cuttings and cover with manure until next Spring. If plants are purchased from nurseries, Spring for your climate would be the best time to transplant. The quince needs a deep, rich soil and it should be as well prepared as if corn or potatoes were to be planted. Then an application of manure every two years should be given. An occasional light dressing of salt is thought by many to be beneficial. Cut out all suckers. Confine the trees to one stem. Plant them 10 to 12 feet apart. The Orange and Rea's Mammoth are the best varieties. The above, though it might be elaborated so as to fill two columns, tells essentially the whole story. We are always pleased to furnish articles upon *any* rural topic to the order of our friends.

Fertilizers for Wheat.

D. J. A., Moore's Station, Va., asks whether it would be advisable to drill with wheat 200 pounds per acre of a mixture of slaked lime and kainit (German potash salts) in proportion of two parts of the former to one of the latter. In that section the best results are obtained by using dissolved South Carolina rock or bone, two parts to one of kainit; and he wishes to learn what difference it would make to use slaked or pulverized lime instead of the South Carolina rock.

ANS.—The dissolved South Carolina rock is superphosphate of lime containing soluble phosphoric acid, no different from that made from bones, and it should be treated in the same way. If lime is mixed with it, or if lime is applied to the soil along with it, the lime combines with the excess of phosphoric acid and forms insoluble phosphate, thus destroying the value of the dissolved phosphate. Kainit, which is a mixture of salts of potash, magnesia and soda, will be useful and may be mixed with the phosphate without injury. So may plaster, which is sulphate of lime, and will be as useful as the slaked lime. A very good mixture would be 200 pounds of the rock superphosphate, 200 pounds of potash salts (high-grade muriate of potash is the best and cheapest in the end), and, if desired, 100 pounds of blood guano to furnish the nitrogen. But at this season, the nitrogen may be dispensed with.

Growing Seedling Apples and Grapes.

M B., Newark, N. J., asks how should apple and grape seeds be planted, and what soil is best suited to them.

ANS.—The best way would be to procure the apple seeds now and preserve them in boxes of sand during the Winter. The boxes may be buried or kept in the cellar. In the latter case it would be necessary to keep the sand slightly moist, or the seeds would become dry and germinate slowly or not at all. Prepare a little plot the same as for lettuce, radishes or beets. Make it mellow and tolerably rich. Plant the seeds a few inches apart. The young seedlings should be protected the following Winter and transplanted in the Spring either to nursery rows or where they are to remain. If you have glass, or even a sunny window, grape seeds may be planted now. Flower-pots will answer. Plant the seeds half an inch deep and cover with glass. The seeds should be planted as soon as taken from the grape, in which case many will germinate in a month. The young vines may be planted in the open ground next Spring, when they will have made a growth of from one to three feet. We have frequently urged our friends to raise seedling grapes.

Income from Sugar Cane Culture.

C. P., Cinnaminson, N. J., referring to a statement in the Fair No. of the RURAL, to the effect that a Louisiana planter sold his crop of sugar last year from 3,287 acres for $565,000, asks for further information on that head.

ANS.—The result is by no means remarkable. The possible product of the sugar lands of Louisiana is twice as much as this, and if the machinery were capable of extracting the juice, the production would be equal to nearly 6,000 pounds of sugar per acre, which, at only five cents a pound, would realize $300, and in addition nearly 4,000 pounds of molasses, worth, at two cents a pound, $80 more. But the defective processes waste a large part of the product. Sugar cane contains 10½ per cent. of sugar and an average crop is 60,000 pounds of cane per acre. It is an example of what yet remains to be accomplished in this direction by the invention and employment of improved processes in the manipulation of the cane.

Lung Trouble in Lambs.

L. C. R., New Geneva, Pa., says the lambs there are dying with a disease resembling catarrh; they run at the nose and seem to have a difficulty in breathing, and he asks for a remedy.

ANS.—This is evidently a disease of the lungs, which has not yet progressed so far as pneumonia, but may very soon take that form, if not prevented. It is probably due to cold taken in consequence of overheating and sudden cooling. The treatment in such a case is to keep the lambs in a dry, shady yard for a few days; give them pine tar in the drinking water and half a drachm of saltpeter once a day for three or four days. To prevent this trouble, both sheep and lambs should be provided with shade in the pasture in the hot weather and shelter from sudden showers. Exposure to a shower, on a hot day, when the animals burdened with their warm woolen coats, are in a state of profuse perspiration, will produce this trouble with the lungs, which if neglected may soon change to pneumonia or pleurisy.

"Cassava."

E. W. K., Glen's Falls, N. Y., sends the leaf of a vine which produces a slim root and is sometimes called "Cassava" along the Hudson River, and asks whether it is the cassava or mandioca spoken of in the RURAL of Sept 4, in the Domestic Economy Department.

ANS.—We cannot identify this vine from a single leaf; but it cannot be the cassava referred to, which is the meal or bread made from the roots of several species of manihot which grow in the West Indies, South America and Africa. The chief species—Manihot utilissima—from whose roots nearly all the cassava and tapioca come, is a shrub from six to eight feet high, with large tuberous roots often weighing 30 pounds. There are two other species whose roots are also utilized for the same purposes, but these are not nearly so common, and none of them grows along the Hudson.

Keeping Choice Seed Potatoes till Spring.

W. B A., New Milford, N. J., asks the best way to keep a few choice seed potatoes in the best condition until Spring, regardless alike of consequent trouble or expense.

ANS.—Whenever we have valuable seed potatoes we place them in boxes of dry sand, and keep the boxes in a room or dry cellar where the temperature is low. Probably a potato packed in a box in sand and buried 18 inches deep in a dry place would keep until needed for planting in the Spring. If any of our readers know of better plans we would be glad to hear from them.

Miscellaneous.

E. C., Menard, Texas, asks, 1, for the name of a reliable dealer in seeds in the North; 2, the name of a good practical work on sheep husbandry suitable for Western sheep owners; 3, the name of an English work on sheep husbandry in Australia and New Zealand.

ANS.—1, All the seedmen who advertise in the RURAL are trustworthy; we admit the advertisements of no other. 2, The Shepherd's Manual by our contributor Henry Stewart, is the latest and most complete work on Sheep Husbandry published in this country—price $1.50, to be obtained through the American News Co., N. Y. City. 3, A Treatise on the Australian Merino by J. R. Graham, Melbourne, Australia (1870) is the only work known to us and we believe the only work relating to the subject. The work can propbably be obtained through any of our large book-dealers.

W. S. (*address mislaid*) asks how much potash should be used with a ton of bone dust; what kind of potash is the best, and how should it be mixed with the bone dust; which is the better—sowing it broadcast or drilling it in with the grain.

ANS.—There is nothing gained in mixing anything with bone-dust, and if potash should be mixed, it would be dangerous to drill it with the seed. Bone-dust is best drilled with the seed because it is placed where the young plants can reach it at once and make immediate use of it. If potash is used, it would be best to sow that broadcast and harrow in before the seed is sown, or sow it on the loose soil immediately after the harrow. The high-grade muriate of potash, containing 50 per cent. of actual potash, is the best form in which to apply potash, that is, in the absence of unleached wood-ashes, which are always the best.

Geo. W. Strong, Davenport, Ia., writes us—"In the list of premiums offered in the RURAL of April 26th 1879, is an offer of Dickens's works, made by the Farmers' Publishing Co., as the second prize for the greatest weight of shelled Blount's corn obtained from the RURAL's free seed distribution, three months after harvest. Now I won the second prize for my yield of corn, and got the feed mill all right, but did I not win Dickens's works also? I have never seen anything said in the RURAL about the winners of the book prizes, and hence rise for an explanation."

ANS.—Will Conrad Wilson, who offered these premiums in the name of the Farmers' Publishing Co., please explain.

G. E. N., Afton, N. Y., asks for an analysis of sour milk.

ANS.—Milk contains when fresh about the following constituents:

Caseine or cheesy matter	4.50	per cent.
Butter	3.13	do.
Milk sugar	4.75	do.
Saline matter (phosphates, &c.)	0.60	do.
Water	87.02	do.
	100.00	

When the butter is taken out, the remaining substances are, of course, left. When the milk is sour the sugar has been changed to lactic acid, by the action of the caseine and no other change occurs, so that sour milk if the cream has not been taken, differs from fresh only in the change of the sugar of the latter into acid.

J. M. McL., Okolona, Miss., asks what he should do for a sick peach tree. It has stopped bearing for two years, or rather the fruit shrivels and drops off while small, or becomes so worm-eaten as to be worthless. The tree is slowly dying, probably half of it is already dead,

ANS.—This is no doubt the yellows. It is incurable. The best thing that can be done is to dig up the tree, root and branch, and burn it. Be careful not to set another near the place, as this disease is highly contagious, and may be communicated by the budding knife.

G. K., Litchfield, Mich., asks what is the best time to sow Red Top; how much seed should be sowed per acre; should it be sown by itself or mixed with timothy.

ANS.—Sow Red Top in the Spring. Prepare the ground well and harrow until fine, then sow the seed, one and one-half bushel, or 20 pounds, per acre, with eight pounds of Timothy, and cover with a light brush harrow very lightly.

J. E. M., South Bend, Ind., asks which of these addresses is proper: John Smith, New York City, N. Y., or John Smith, New York, N. Y.

ANS.—The first is the proper way of addressing a letter to Mr. Smith, so far as the name of the town is concerned; but a letter addressed either way would not reach the gentleman, as the city directory shows there are 168 men of that name in the city, to say nothing of the large number of juvenile and other sorts of John Smiths that are not mentioned therein.

T. R. W., Roselle, N. J., sends a branch of a lilac bush covered with what he thinks either a fungus growth or an insect pest, and asks what is it.

ANS.—It seems to be a bark louse. We would advise the application of equal parts of linseed oil and tar applied warm early in Spring. This forms a varnish which will crack off as the stems expand in the Spring.

L. D., Belmont, N. S. wants to know the best apples for his country. He would also like to analize soil, and asks if it would be necessary to study with a chemist.

ANS.—1. Gravenstein, King of Tompkins County, Large Yellow Bough, Northern Spy, Red Astrachan, Ribston Pippin, Yellow Bellefleur. 2. Yes.

M. A. P., Sterling Station N. Y., sends some flowers of a weed which is greatly injuring a meadow, and asks how to get rid of it without plowing the meadow.

ANS.—It is a Golden Rod. Without plowing, you can only exterminate it by persistent mowing, an almost impracticable remedy.

C. S., Fayette, N. Y., asks what shall she do with her magnolias, two of which germinated in July and are still in pots; would it be well to transplant them this Fall and cover them during the Winter.

ANS.—No, it would be unsafe to plant them out this Fall. Wait until Spring.

C. S., Fayette, N. Y., asks what kind of beet seed will give most dark red *inside*, not on the surface merely, as the blood beet.

ANS.—Long red mangel. It is not so dark red as the blood beet either inside or outside, but is dark red and some roots are quite light red.

A. H. W., River Falls, Wis., says he sends two specimens of grass for name.

ANS.—The box had been opened in the mails. We received but one specimen and that was not marked. It is Setaria glauca—Bottle Grass; of no particular value.

J. R., Huntington, Pa., sends a bunch of grapes for name.

ANS.—The specimens are so crushed that we cannot identify the variety positively. The fruit resembles Iona, however.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, SEPT. 25.

Dyspepsia, Biliousness, Nervousness and miserableness all cured with Hop Bitters.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 2, 1880.

MR. HENRY STEWART writes us from his farm in New Jersey: "Rural Branching Sorghum 11 feet high, and if it doesn't freeze it will ripen seed. Second growth by Aug. 5 six feet high; third growth, two feet. It is the boss fodder."

We have just sent three of our own plants to the Queens County Agricultural Fair. The first, though planted late upon poor, hot soil without manure, is ten feet high. The second, cut August 5th, is four feet high. The third, cut August 25th, is 18 inches high.

THE ENGLISH SPARROW.—We have always felt a great fondness for animals—especially birds, which we could never feel reconciled to see shot upon our premises. We were among those years ago to praise the English sparrow and to advocate its protection. But we now warn farmers against this bird as a formidable enemy—more formidable than the insects he is supposed to kill by his staunchest friends. We have already remarked upon the serious damage which our wheat fields sustained by its ravages, and we have now to speak of the injury it has done to corn. It is found, upon a careful examination of our fields, that as many as one ear in every three has been damaged—sometimes only at the very tip; sometimes as far as six inches down the ear, or as far as the sparrow could separate the husk so as to eat the kernel.

Those farmers who are benevolent enough to share their crops to this extent with this unruly, greedy bird, may do so of course, though it is hard to tell how severely their benevolence may be tested in a few years, so rapidly does the sparrow increase its numbers. But we think such kindness might more wisely be extended to many of our native song birds which seem to have been driven away to the fields or woods or to other parts where the sparrow's yelp is not yet heard.

IS IT A FACT?—A short time ago a daily paper in this city remarked that dealers here who handle large amounts of Western butter had lately noticed that the 50-pound tubs which usually weigh from 50 to 52 pounds each when full, frequently weighed from 56 to 60 pounds. It was said that this increase of six to eight pounds in the same bulk was noticed only in Western packages; but even skillful buyers failed to detect any foreign substance in the suspected article. The paper went on to say that recently a prominent butter and cheese dealer in this city discovered the fraud during a Western trip. A Cincinnati company is largely engaged in the manufacture of powdered soapstone, and it was asserted that this shrewd dealer discovered that some farmers and butter packers in that section used it to adulterate their butter, it being impossible to detect the cheat by any ordinary test. This report has produced a good deal of excitement among the butter dealers in Cincinnati and the farmers of the adjoining country, and a number of prominent dealers have published a card emphatically denying that soapstone is used for any such purposes by them, or, according to their belief, by anyone else in that city. This is a matter which should be promptly and carefully investigated, and should any be discovered guilty of the fraud, they should receive the severest legal punishment possible, besides getting the unenviable notoriety attached to the widest publication of their names in the public press. Even the rumor of such a swindle tends so greatly to injure the butter interest in that section, that already a report is out that the scandal is the work of the oleomargarine men to injure the sale of genuine butter.

A NEW USE FOR DYNAMITE.

IT has occasionally been suggested that the severe frosts of our Northern Winters would be likely to seriously interfere with the process of preserving green fodder by burying it in pits. It has been supposed indeed by some persons that, in order to prevent the soil from freezing, it would be necessary to cover the pit with some kind of a house or shed; though it stands to reason that the action of the frost might be hindered, if need were, by covering the earth above the pit with straw or leaves. It is of interest to note in this connection that in some parts of Germany the farmers are familiar with the freezing of the earth used to cover the pits in which beet roots are stored, and that latterly a plan of opening the frozen ground with dynamite has been put in practice. It is stated that for opening a trench forty feet long, eight holes of a foot or more in depth were bored with a wheelwright's auger and cartridges placed in each. After the explosion, a couple of men removed the fragments of frozen soil in less than an hour, and none of the beets were harmed. This method of opening is said to be not only easier than the old system of digging a small hole, with pick and bar, at one end of the trench and creeping in beneath the frozen roof,—but much safer, since the earth was liable to fall unexpectedly. As applied to the opening of pitted fodder, the use of dynamite would have the merit of encouraging the establishment of small pits by farmers unable or unwilling to go to much expense for special constructions. It lends itself to the policy of cautious experimenting with ensilage which has been advocated by several of our correspondents.

OUR WASTE LANDS.

Now that the wave of emigration has found a western shore upon which it recoils, the current must stop or find some other direction. The limit of successful agriculture in the West seems to have been reached, for already thousands of settlers have found that they have gone too far and have actually penetrated the arid districts where no vegetable growth can thrive without irrigation, although it may exist without it. It is therefore well that attention should be called to the vacant lands in the East and South, where there are millions of acres which need only cheap reclamation to become productive. The broad Alleghany ranges, with their outlying spurs and parallel ridges, are all but unoccupied, and land on those hills and in the valleys between them can be purchased in large tracts for nominal prices. Whole counties in Maine, New York, Pennsylvania, West Virginia, Tennessee and Kentucky large tracts in other States and smaller tracts almost everywhere, are ready and waiting to be reclaimed. Parts of them may be profitably turned to timber culture and the remaining portion, the better share of the land, is admirably adapted to grass and grazing either for lighter and more hardy beeves or the hardier kinds of sheep. The attention of those philanthropic societies, whose aim is to encourage the seating of industrious men of small means upon farms of their own, might be turned to these tracts, upon which the annual fires now purposely set every Spring, destroy the young timber and kill the grass and so keep back their reclamation.

THE EFFECT OF MANUFACTORIES.

IF the whole community were engaged in raising food there would be no markets, excepting foreign ones, to which the surplus would be sent to be exchanged for manufactured articles. But it is convenient and economical to have markets near to the producer to avoid the cost of carriage for long distances. This becomes very conspicuously true and plain when a factory or other industrial enterprise is operated in a community of farmers; and it is beyond question that nothing more rejoices a farmer than to see mills built and operated and a village growing within sight of his farm. The remarkable growth of the manufacturing industry of the United States cannot fail to have a most beneficial effect upon agriculture. One instance may suffice.

Paterson in New Jersey had in 1873, 30 silk manufactories within its limits. Its population was then about 30,000. Now it has 102 factories engaged in the silk industry, which employ 12,599 operatives, who earn in wages more than four million dollars per annum, or $80,000 weekly, or more than $13,000 daily; and which turn out an annual product valued at over twelve million dollars. The present population of that city is over 50,000. The farmers for miles around find a good market for their products there, and eager buyers for hard cash at prices considerably higher than are current at the not-far-distant New York markets. Everywhere throughout our land there are such busy centers of industry springing up, which provide markets for agricultural produce. These markets are daily increasing, and this fact ought to be a matter for congratulation by farmers who are benefited, and by those who hope to be.

GERMS AND THOUGHTS GERMANE.

Recent investigations have very much added to our knowledge of contagious diseases of men and animals. Since the discovery of infusorial life and its propagation in liquids containing organic matter in solution, and which at first was supposed to be spontaneous and self-productive, a great number of careful investigations have been made. The most accurate and successful investigator in this line has been that accomplished chemist, M. Pasteur. The result of more than 30 years' constant work in this direction has been to greatly simplify our knowledge of virulent diseases. In a practical manner it has been first surmised and then proved, that the fatal epidemics which from time to time destroyed many thousands of human beings, sweeping in a steady wave over countries and continents, were occasioned by the presence of filth, and that the human system, enfeebled by unhealthful conditions, offered every convenience for infection and contagion.

Sanitary measures afforded relief, but the precise means by which the infection was conveyed were not understood until after the discovery of the existence of peculiar organisms existing in the blood of diseased persons and the fact that these organisms had specific differences and could be cultivated and reproduced with all their specific variations and peculiarities. The results of many investigations have shown, for instance, that such diseases as small pox, yellow fever, cholera-morbus, malaria, and even boils, in mankind, are occasioned by the presence in the blood of certain distinctly different parasitic organisms, each one peculiar in its own specific developments and each one re-productive of its own kind by inoculation or contagion.

So in animals, it has been found that the fatal hog-cholera, the parturient fever of cows and the frequent and as fatal chicken-cholera and other similar epizootic diseases are caused and spread by means of specific germs which can be bred or cultivated in watery solutions of organic matter, one drop of which infected matter injected into the veins of any animal liable to that particular disease, is sufficient to produce that disease in its most virulent form. It is a vast help in combating disease, in man or in animals, to know its character. That is the main part of the battle. That provides us with means for prevention and suggestions as to successful treatment. But prevention is the best cure. And it is a wonderful help that we know that the germs of the most virulent diseases enter the system either by the stomach or the lungs, or by contact with previously diseased and exposed surfaces.

This knowledge, therefore, should put us on our guard against filth and foulness of air, of food, of water, and every one of our surroundings; moreover, it should caution us to maintain the most perfect health possible by the use of the most nutritious food, abundant water, the avoidance of all weakening excesses of whatever kind, either negative or positive; for it is very certain that although these germs may be present, yet in systems fortified by vigorous health they find no acceptable resting place, and are disorganized and disappear, unless they find such conditions as favor their enormously rapid production in the blood.

INCOMPREHENSIBLE TO THE FARMERS.

VERY recently there appeared in our columns a pertinent protest against the clothing of common facts in such language as may be beyond the comprehension of ordinary readers, and the understanding of which is a task and labor, irksome even to those who can comprehend it, but who have not the time to spare for the mental operation required for the necessary consideration. Language is to be used for the conveyance of thoughts and ideas; and in these days when rapidity of execution is the first requirement in work of all kinds, whether of the hand or the mind, the language used should be such as to strike the mind instantly and produce immediate effect. Our time is too short even for study, except with those whose business is study; and even these have no time to waste in acquiring knowledge more slowly than is absolutely necessary. The best writers are those who are the most easily understood and who use the fewest and simplest words to communicate their ideas. As a curious example of a very simple truth that has been often expressed and is by no means unknown to persons of very moderate comprehension, we might present the following remarks made by no less a person than the Duke of Argyle, in one of his recent publications in England. The Duke who is an accomplished agriculturist and a scientific man says: "Out of the chemical elements of nature, in numerous but definite combinations, it is the special function of vegetable life to lay the foundation of organic mechanism, while it is the special function of animal life to take in the materials thus supplied, and to build them up into the highest and most complicated structures. This involves a vast cycle of operations, as to the unity of which we cannot be mistaken—for it is a cycle of operations obviously depending on adjustments among all the forces both of solar and terrestrial physics—and every part of this vast series of adjustments must be in continuous and unbroken correlation with the rest."

If this was intended for the instruction of plain farmers, how much easier it would have been to have said that vegetables nourished by the soil, supply food to animals; and animal substance, returning to the soil, furnishes the nourishment for a succeeding growth of vegetables; and in this manner the vital forces of nature operate continuously. The same truth has been put even more forcibly by a farmer who said, "more grass, more cattle; more cattle, more manure; and more manure, more grass;" thus signifying the natural sequences of the mineral, vegetable and animal functions. We might here pertinently refer to the aggravating difficulty in reducing the metric weights and measures, of grams and centimeters, into the common grains and inches of daily use, in those instances where reports of chemists are published for popular information. The whole value of these is lost to those persons who are unacquainted with the value of the metric tables, but if the writers would add the common values, in parentheses, to their tables—a very small trouble to them—the usefulness of their work would be complete. Public teachers of whatever kind should aim to be the most widely effective, and nothing is lost in any way, but much is gained in every way, by being plain and simple.

BREVITIES.

WE shall be able to report the yield of our Chester County Mammoth and Blount's corn, shortly.

THE bushel of Clawson wheat which we cleaned out for the Queens Co. Fair weighs 66 pounds. We think its weight will average 63 pounds. Nevertheless, this is our last year with Clawson. Our main crop will be Silver Chaff, which we believe will yield more and make a better flour. Let us see.

THE production of sufficient sugar for the wants of the people of the United States, if not for export, now seems to be a fact to be counted upon at no distant day. One of the greatest drains of wealth from this country for the past half century has been to purchase sugar, at one time as much as $100,000,000 going abroad annually for that purpose, and there was on our part at one time a serious consideration of purchasing Cuba to save that outgo. But in the sugar cane, sorghum and beet root there are now probabilities that the census will show a beginning which will warrant the hope of the production of all our own sugar at no distant day. Besides, the patronage of Cuban sugar growing is one of the greatest aids to keeping slavery alive in that island, and America has now grown past that relic of barbarism, and it is with great pleasure that the efforts to produce our own sugar will be contemplated.

A REWARD of $5,000 has lately been offered for a stock-car which on experience shall prove the most suitable, humane and comfortable as well as economical for the transportation of cattle, sheep and hogs from the western prairies to the Eastern markets. The main requirements in the stock-car of the future must be an economical arrangement. Years ago palace stock-cars were invented with partitions between the animals, fodder racks and water tanks, but the railroads declared they could not afford to use them. The animals on them, it is true, arrived at their destination in a condition so much better than usual that the owners could well afford to pay the trifling extra cost of transportation, owing to the larger space allotted to each animal and the outlay for the various conveniences; but the cars had generally to go back empty, or the fixtures had to be removed and carried back on top of the cars. Either some acceptable form of car should soon be devised, or laws should be passed compelling the railroad companies to use greater care and humanity in transporting stock. These are absolutely needed, not only for the sake of the poor, ill-used dumb brutes, but also for the sake of the public who eat the meat rendered unhealthful by the fever and suffering often now endured by the animals during their transportation. We have frequently protested against the cruelty to which animals are subjected on shipboard during their passage to Europe; but there are multitudes of well authenticated instances where sufferings quite as great, and almost as protracted are endured by stock during their travels by railroad, and these are capable of much more easy amelioration than those by sea. For animals intended for export, the previous hardships by rail, often predispose them to disease on shipboard and not a few of the cases of disease and death among stock on the transatlantic voyage are due to this cause.

Literary Miscellany.

IN TOWN.

I HAVE a friend across the street,
We never yet exchanged a word,
Yet dear to me his accents sweet,
I am a woman—he a bird.

And here we twain in exile dwell,
Far from our native woods and skies,
And dewy lawns with healthful smell,
Where daisies lift their laughing eyes.

Never again from moss-built nest,
Shall the caged woodlark blithely soar;
Never again the heath be pressed,
By foot of mine forevermore!

Yet from that feathered, quivering throat,
A blessing wings across to me;
No thrall can hold that mellow note,
Or quench its flame in slavery.

When morning dawns in holy calm,
And each true heart to worship calls,
Mine is the prayer, but his the psalm,
That floats about our prison walls.

And as behind the thwarting wires
The captive creature throbs and sings,
With him my mounting soul aspires,
On Music's strong and cleaving wings.

My chains fall off, the prison gates
Fly open, as with magic key;
And far from life's perplexing straits,
My spirit wanders, swift and free.

Back to the heather, breathing deep
The fragrance of the mountain breeze,
I hear the wind's melodious sweep,
Through tossing boughs of ancient trees.

Beneath a porch where roses climb,
I stand as I was used to stand,
Where cattle-bells with drowsy chime
Make music in the quiet land.

Fast fades the dream in distance dim,
Tears rouse me with a sudden shock;
Lo! at my door, erect and trim,
The postman gives his double knock.

And a great city's lumbering noise
Arises with confusing hum,
And whistling shrill of butcher's boys;
My day begins, my bird is dumb.

—Temple Bar.

INMATES OF LESTER HALL.

CHAPTER IV.

(Continued from page 645.)

Slipping the check into his pocket-book, Rex. crossed languidly to the table, sat down, glanced at some letters lying there, wrote one or two, then pushed away his seat.

"My head aches furiously," he muttered impatiently; "and I'm tired. I got no sleep last night with that horrid cough."

He flung himself down in the armchair again, passed his hand wearily over his brow once or twice, and fell into a heavy but disturbed sleep, which lasted some time. Awaking with a start he glanced vacantly around him, then recollecting where he was, he uttered an exclamation and rose, staggering slightly, as if weak or giddy.

"Almost six o'clock," he exclaimed, glancing at his watch. "And I have to meet Carewe at the club at half-past."

He rang the bell, desired the clerk who answered it to send for a carriage, and asked whether his uncle had left. The answer was an affirmative one, and a few minutes after Reginald Lester, having fortified himself with a brandy and soda at the nearest restaurant, was rolling rapidly towards a fashionable club, where he was engaged to dine with two or three kindred spirits.

This was how he kept the promise he had given to his uncle. If Mattie could have known! If she could have seen—would she not have felt that no greater degradation could have fallen on her brother than this?

CHAPTER V.

DANGER AHEAD.

"Easy is the descent of Avernus," says the Latin proverb, and easy, thrice easy, did Reginald Lester find it. Once entangled in the snares of dissipation, excess and gambling, he could not set himself free. Not that he made much effort to do so; he did not care for his freedom, he plunged deeper and deeper into the mire; although he was perhaps a trifle more careful to conceal his conduct from his uncle.

Even when he found that his health was seriously affected by his manner of life it did not seem to deter him; he went on his way regardless of the incessant cough which racked his frame, or of the greater increasing weakness and languor and of the greater and greater disinclination to any active exertion.

For many weeks Mr. Daton never suspected that his nephew was deceiving him, and breaking the promise he had given "upon his honor;" and when he discovered it by chance, his wrath was terrible. There was a short but stormy and decisive interview between them, during which the merchant was stern and bitter, the young man by turns sullen and indifferent, which ended in a command from Mr. Daton that his nephew should never darken his door again, and by Rex. Lester taking his hat, bowing low with a nonchalant, mocking grace, and leaving his uncle's presence, outwardly smiling and indifferent, but inwardly full of anguish and despair. He knew that ruin was at hand now; he knew that he was deeply, irretrievably in debt, and that one whisper of his uncle's displeasure would cause his creditors to swarm round him like bees.

"The game is up," he said to himself, bitterly, as he went out into the street.

"I am ruined. I have run a-muck, as Carewe calls it, with a vengeance! There is nothing left for it but a bolt, I suppose, and shame, disgrace, and death after. Good Heaven! why have I not the courage to put a pistol to my head and end it all!"

He walked on slowly for a few yards, then hailed a cab, gave the coachmen an address, and promised him double fare if he went fast. The horse chanced to be a good one, and they dashed off rapidly, pulling up at a little arched door in the wall of the grounds surrounding the house whose address Rex had given.

Opening this, Reginald passed through the grounds, which were small, but well kept and carefully walled in. The house stood well back from the road, and was almost concealed by the tall trees and dense shrubbery.

Rex. Lester's imperative knock at the door was answered by a man-servant out of livery, who admitted Rex into the dainty miniature halls, with its tesselated pavements, its shaded lights and scented flowers, and assisted him to remove his overcoat in solemn silence.

"Get me some brandy, Carter," said Mr. Lester, curtly; and when the man obeyed his behest, he drank a deep draft of the fiery spirit, and pulled himself together, as it were, with a slight shudder.

"That's better," he said, with a ghastly laugh, as he handed the glass back to the servant, and passed up the low, broad carpeted staircase to a room on the first floor, from whence the sound of voices came, whose doors were hidden under heavy velvet curtains, which muffled the tones and laughter into a softer key.

Reginald Lester entered the room, pushing aside the velvet hangings, and opening the doors without the slightest formality, nor did his entrance cause any disturbance as he stood for a moment looking at the scene before him.

The room, one of a suite of three opening one into another, was brilliantly lighted and richly furnished.

The air was heavy with perfume and with the aroma of choice cigars, and around each of three or four tables were grouped some half-dozen men playing various games of cards or dice or chance.

The play was at its highest as Reginald entered, heaps of gold and notes stood upon the tables, and more than one of the faces of the gamblers was pale and haggard, others flushed and triumphant; and the play was proceeding almost in silence. Now and then one rose for a moment from the table, and crossed to a small table on which stood glasses and decanters full of various kinds of wine, and drank down a deep draft before he returned to the table.

"Hallo, Lester, is that you? Just in time," said a voice, after a minute or two. "Come on, we'll make room for you here."

So saying, the speaker, a handsome, fashionable, even aristocratic-looking man of two or three and thirty, drew a chair to his side; and after a momentary hesitation Reginald went over to the table and sat down, leaning his head on his hand for a moment, as he looked at the glittering heap which lay at his friend's elbow.

"You appear to have been lucky, Carewe?" he said, languidly.

"Very," said the other, carelessly. "Try your luck, Rex—fortune is befriending us."

"She won't do so long," said Reginald, with an attempt at laughter which brought on a paroxysm of coughing, after which he lay back in his chair for some minutes completely exhausted; then strengthening himself by a draught of strong, fiery Roussillon, he joined in the game, taking out of his pocket a handful of notes, which he began to stake with reckless excitement.

For some time he won steadily, and the excitement rose higher and higher, while the noise seemed to die gradually away, and the stillness of intense, highstrung excitement succeeded.

Reginald sat with his elbow on the table, and a fierce, almost delirious light in his eyes; he knew that it would be the last time he should play. That even if he won largely to-night it would avail nothing; while if he lost, deeper shame, more complete ruin stared him in the face.

He did not speak beyond the usual formula of the game; no word passed his lips, but the deadly pallor of his face contrasted strongly with the spot of vivid, burning red on either cheekbone; and the fierce glitter of his hazel eyes, so sunken and hollow, would have told a sorrowful tale to any pitiful observer.

The night-hours wore on; the play rose higher and higher; one or two men left the tables empty-handed, with their faces ashy pale and their hearts full of bitterness and despair; but the gap made by their absence was soon filled up, and the play went on without intermission. At last the run of luck, which had flowed so completely in Reginald's favor, turned, and he began to lose, until the heap of notes and gold rapidly and surely diminished, and grew perceptibly less, while the ghastly pallor deepened on his face and the feverish glitter in his eyes. At last the last sovereign was gone, and Rex. Lester sat staring at the table in a silence so stricken and complete, that the man who sat by his side glanced at him rather anxiously.

"You are not going to be so mad as to stop now?" he said, in a low tone. "The luck will turn again."

"I am cleaned out," Reginald said, with a ghastly laugh.

"Never mind, go; you can always get money," said Mr. Carewe, in the same hurried whisper, and Rex. hesitated for a moment, then he shook his head, and rose unsteadily from the table, staggering slightly in his gait as he did so.

Reginald crossed the room with the steady, faltering gait, and went to the window, pushing aside the curtains and opening it, admitting a keen gust of wind as he did so. The dawn was breaking dimly and feebly in the east, and the day was dawning cold and chill. Reginald leaned out far into the night, although he shivered as he met the chill blast.

"Shut that window, Lester; are you mad?" said Mr. Carewe, turning his face for a moment,

"It is bitterly cold."

Reginald obeyed mechanically, and turned from the window, standing still for a moment in the same strange, undecided manner. Then he went towards the door, staggering and slow, as if he moved only by an effort; and just ere he reached it he stood still again, swaying to and fro, and then fell suddenly forward his full length on the floor.

There was a slight stir at the gambling-table and Mr. Carewe rose hastily and went to his friend's assistance. He knelt beside him and raised his head with hasty, unsteady hands, and an exclamation of horror broke from his lips! Reginald's eyes were closed, and from his lips there came a thin red stream which stained the whiteness of his linen and dyed Carewe's hands as he raised the feeble head.

"I believe he is dead," he said, in a low, horror-stricken tone. "Help me, one of you!"

Very gently they lifted him, and carried him into another room, and while one tried to staunch the terrible hemorrhage another rushed off for a doctor. Fortunately medical aid was quickly forthcoming, and soon the hemorrhage ceased, and when consciousness returned, Rex. was sufficiently recovered to be taken in the doctor's cushioned carriage to his own chamber.

There the doctor left him, with strict injunction for perfect quiet, and there, for twenty-four hours Reginald lay passive, languid, facing his ruin with thoughts full of despair. His only visitor, and even he was by no means a frequent one, was Mr. Carewe; and on his second visit Reginald told him frankly of his circumstances, of his quarrel with his uncle and his ruin.

Mr. Carewe listened in silence, with his face darkening and his eyes filling with a baleful light.

"You led me to believe that you were sure of your uncle," he said, coldly. "You have lived fast and loose for the last two years without the slightest excuse for so doing. How do you intend now to escape from your creditors? How do you intend to settle those debts of honor you so recklessly contracted?"

"You have no right to reproach me!" said Reginald, furiously, with a flush on his cheek. "You led me on; you introduced me to those who have ruined me; you were the tempter!"

"Gently, gently!—you must not excite yourself!" said Mr. Carewe, with a sneer. "You are to keep quiet, you know. I will send you a doctor whose charges shall be moderate, considering your circumstances. Adieu!"

"Carewe, you shall not go—you shall not leave me thus;" said Reginald, hastily, forgetting his weakness and exhaustion. "Carewe, I say, you must wait!"

His voice failed, and he sank back on the cushions completely exhausted, while Carewe, with a slight gesture—half mocking, half pitying—of farewell, passed out of the room, leaving Reginald panting, furious, excited, but too feeble to prevent him.

In the afternoon of that day the doctor of whom Mr. Carewe had spoken came, and although he carefully avoided any mention of Mr. Carewe, he devoted himself with care and skill to his patient. So four days went by almost unnoticed, and not one of the gay friends of Reginald's butterfly career came near him.

Ill news travels apace, and it soon got bruited abroad that Mr. Daton, the great merchant-prince had disowned his nephew, and that they had quarrelled irreparably; and the bills came pouring in, and angry creditors had fierce encounters with poor Reginald's servant, who, strangely enough, was faithful to him in his extremity.

On that fourth day Reginald, turning suddenly upon the doctor with a strange earnestness asked abruptly:

"Is there any chance of getting over this?"

The kind, grave eyes avoided his as the physician answered, in that stereotyped sentence:

"While there is life there is hope."

"Have you any? Doctor, you are honest, even though you—forgive me, I hardly know what I am saying; but you are honest and true—answer me honestly and truly, shall I recover?"

"You ask me a question no human being dare answer decisively," said the other, tremulously.

"What is your opinion?" persisted Rex. "Shall I get well?"

"I think—I am afraid not!" stammered the other.

"Why are you afraid?" said Rex. with a bitter smile. "Should you not rather rejoice that such a life as mine is ended thus, and not by a dose of laudanum or a pistol-shot? Well," he went on in a moment, "I am glad to know it, Poor Mattie! poor little Cecil! this is the end of it all!"

He sank back, closing his eyes wearily; but by-and-by, when the doctor took his leave, he roused up, and held out his trembling, burning fingers.

"Thank you doctor," he said, with a little sad smile. "You have been a good friend to me—the only one, save the uncle whose regard I have alienated, the sisters whom I have neglected. Good-bye, and thank you."

"Until to-morrow," said the doctor, as he went away; but the next day, when he came to see his patient, he found that he had left.

"Left while I was away getting that medicine," said the servant, with something very like tears in his eyes. "He put his watch on this slip of paper addressed to me, and there is this note for you, sir."

The doctor took it and read it in silence. It contained a few grateful words of farewell, written in a tremulous, unsteady hand.

"You need not trouble about me any more," it said. "I am going where I shall be well taken care of; and believe that, living or dying, I shall never forget your goodness to me."

That was all, and as the doctor folded the little note, and put it carefully away in his pocket-book, handling it tenderly as though it had been a lady-love's dainty epistle, he thought that the "never" would mean but a short while only if it meant the space of Reginald Lester's short life, for that his days were numbered.

CHAPTER VI.

DEATH-BED.

The June roses are blooming richly at Lester Hall! the lilacs and laburnums have faded with the spring, but the wilderness of summer flowers makes the air sweet and fragrant; and daily Cecil Lester runs out in the fresh morning sunshine, filling her white hands and dainty muslin apron with floral treasures, to be transferred to the old china bowls and Venetian vases, to decorate the rooms of the old Hall.

Three years in their flight have made but little alteration in Mattie Lester. They have, it may be, matured her loveliness into more "perfect perfection," deepened the gold of her hair and the blue of her sweet blue eyes, but there is no other change in her; while Cecil has become, from a handsome, half-formed girl, a stately and beautiful woman, looking older at eighteen than Mattie at one-and-twenty.

More brilliant than her sister, and far more intellectual, she had taken for some months the lead in the little household, Mattie being well content to be set free from household cares, and at leisure to dream the hours away over her beloved piano, for she was *fanatica per la musica*, as Cecil declared, laughingly, sometimes.

She herself was no musician compared to Mattie, but she had a contralto voice of singular beauty and richness, and one which, if properly trained and cultivated, would have made her fortune on any stage. In character Cecil was ardent and impulsive, brave and generous, loving and hating well, and possessing as much resolution in her pretty little finger, to use a homely expression of speech, as her brother and sister joined together.

A woman at eighteen Cecil certainly is, though many girls are children at that age; and many a poor or sick person in the village could have told you stories of Cecil's womanly tenderness which you, if you had only seen her face, with its haughty beauty, would have found hard to believe. Her manner is generally cold and proud to a fault, but when she unbends she can be winning and gracious to a degree; and there is more danger in that winning genticness from Cecil than in the most tender and bewitching coquetries of another woman; and to those whom she loves Cecil is ever most gentle and tender. Eyes and tone soften so often as she addresses them, and even the touch of her little hand, as it meets theirs, tells more strongly than any words how dear they are.

It is morning—a bright, sunshiny, June morning—not much past seven o'clock, an hour when townspeople are beginning to grumble that it is time to get up, but which in the country is so lovely with the song of birds, the scent of flowers, and the clear sunshine. Breakfast is ready in the quaint little sitting-room where we first made acquaintance with Reginald Lester and his sisters, and a bright little wood-fire is burning on the great wide, old-fashioned hearth, for Cecil likes to make the coffee herself, and to be assured that the water was boiling. Coffee is made; Mattie at her piano is playing some grand, solemn melodies of Bach's, which rise and fall on the stillness; and Cecil, having finished her breakfast preparations, stands for a moment, basket in hand, to listen ere she goes out to pick the fresh blossoms opening in sunshine. The beautiful melody goes on, swelling richly out under Mattie's skillful fingers, and Cecil, with a soft light in her eyes which her sister's music can always bring there, passes out of the hall into the gardens beyond.

Very busily and very intently she moves among the flowers, touching them with gentle, almost reverent, fingers—she has a strange living love of flowers—filling her basket with roses and mignonette, and feathery heather, and sweetly-scented stephanotis and syringa, and looking very fair to see, with the sunshine on her chestnut hair, as she passes through the alleys in her simple print morning-dress, so dainty and fresh and simple—the three principal things required in a woman's toilette, believe me, fair reader.

The soft music-strains die away, and Mattie, rising from the music-stool, appears for a moment at the door.

"Come in, dear. The coffee will be cold if you linger among your flowers."

"I am coming," answers Cecil, in her soft, rich voice.

And Mattie goes back into the screened-off sitting-room, while Cecil turns her face homewards, softly humming a song as she goes.

Suddenly the song comes to an abrupt conclusion, the flower-basket falls, scattering its fragrant treasures over the pathway, and Cecil stands still. Her foot has touched some obstacle in the pathway, unheeded in her absorbed interest in the flowers; and looking down, she sees the prostrate figure of a man.

The rich color fades in Cecil's cheek, and a look of alarm steals into the lustrous eyes. Then she stoops and touches him lightly on the shoulder, for the face is hidden, and she cannot tell whether he is sleeping or not. His dress is that of a gentleman, but dusty and travel-stained; and one hand, lying helplessly by his side, is white and slender—very slender, and the hand of one who has never done any manual labor.

"What is the matter? Why are you lying here?" says Cecil, half imploringly, half imperiously.

Both words and touch are unheeded; the man lying at Cecil's feet gives no sign of life, and the young girl's heart sinks with a sudden inexplicable dread, at which the next moment she almost laughs.

"What an absurd idea," she says, half aloud, and stands trembling a little, with the rich color fading in her cheek, looking down at the prostrate figure in silence.

Then, in a minute, she stoops again, and putting her hand on his shoulder, she gives him a little shake, which rouses him effectually; he raises himself slightly on his elbow, and turning his face towards her, looks at her for a moment with vacant, unsteady gaze.

Cecil's heart stands still for a moment. The face, so wan and haggard, so ghastly, is perfectly familiar to her, and the next moment she has fallen on her knees beside him.

"Rex!" she says, under her breath. "Oh! Rex!"

Into the dim, weary eyes there comes a gleam of pleasure.

"Cecil—little Cis—is it you?" he murmurs, softly. "I have come home, you see. I could not die without seeing—you—and Mattie once more."

"Die! oh! Rex!" falters Cecil, too sick at heart, too horrified at the change in her brother, at the seal of death on his face, which even her inexperienced eyes cannot fail to discern, to say anymore, while her brother leaned against her for a moment feeling yet more keenly, at sight of her brilliant beauty and freshness, his own ruin.

"Can you help me up?" he says, in a moment. "I walked up—from the—station—but I could get no farther last night, I suppose. The sight of—the old place was too much for me. Can you help me, Cis?"

Every word he utters seems to require an effort to force it from the parched, blackened lips, and the red spot which contrasts so vividly with the ghastly pallor of his face deepens in his hollow cheek.

"Yes, I can help you, Rex."

"Shall I call Barton?" she says, gently. "He is so much taller than I am; he will help you better."

"Barton—no, I cannot see him," and the shame-stricken look deepens in Reginald Lester's blue eyes. "And yet he knew me—when—"

The words die away on his lips.

"I am quite strong enough to walk."

Very slow and faltering are his steps, but with his sister's assistance he manages to reach the house. The stone steps leading to the hall door are very formidable, but they are mounted at length, and Reginald Lester enters the home of his ancestors, never to leave it again until he is carried forth to his last resting place.

Cecil says nothing; she cannot speak, her heart is too full, and her lips are quivering ominously. Is this the return home of the brother whom she so much loved, and of whom she has always thought with so much pride—this ruined, broken-down man, can he indeed be Reginald Lester, who had left them less than three years ago, so strong, so bright, so gay—so full of hope for the future, so secure in the present? Can it be that his stay, but a brief one after all, has destroyed all this, and made him the wreck he is?"

Mattie, looking up suddenly from a paper over which she glances as she stands by the breakfast-table, sees them as they enter; the beautiful girl, the broken down dying man—and the paper flutters out of her hands and lies unheeded at her feet, as she faces them in surprise too great for words, growing white to her lips.

Reginald Lester sees his sister's face as she turns towards him in its startled pallor and terror, and he tries to say a few words as he holds out his hands to her, but the fictitious strength, born of excitement, which had sustained him during the long northward journey, and had given him strength to find his way from the station to the Hall the previous night, dies away, and he sinks forward helplessly at his sister's feet in a dead swoon.—To be continued.

BRIC-A-BRAC.

"FETCH THE PIE."

A pretty little anecdote about Patti is told by a Vienna paper. In the year, let us say 18—, Adelina Patti was a charming young girl in the first bloom of beauty. It is not necessary to refer to portraits or anecdotes in order to know this, as it is quite sufficient now to see her and hear her sing. Well, at that time Berlioz was one of her most ardent admirers. One evening, after dinner, Patti requested him to write something for her in her album. "Two lines, or only two words," begged the charming singer, with her most bewitching smile, as Berlioz did not seem inclined to grant the request. At last Patti said: "If you will do what I desire, you can make your own choice. You can either have a kiss from me, or one of those pies from cook of which you are so very fond." Berlioz at once took the pen and wrote on one of the leaves of the album the two words, "Oportet pati." "But I don't quite understand this," said the diva, a little perplexed. "Oh, that is cook's Latin," answered Berlioz, slyly laughing. "It means, 'Fetch on the pie.'"

De Summer's gwine fast away,
  Dis hotness cannot last;
The 'skeeter's hum will soon be o'er,
  De flies be wid de past.

Dis world am but a flestin' show,
  We cannot tarry here;
We lib a while, den go away
  Upon de solem bier.

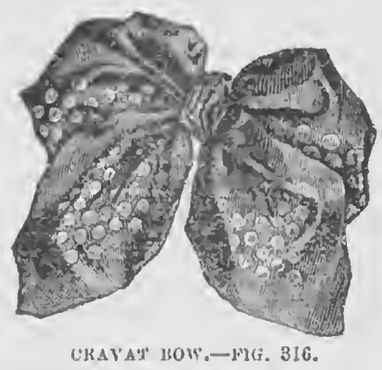
De watermellyon am deceit,
  Persimmons cannot stay;
Cold chicken pie can't keep us heah
  When we are called away.

Our Sunday cloze am wanity,
  Our money am—

The clerk of the court bade the witness give his name, age, etc., and hold up his hand to be sworn. He took the oath with such dignified composure and deliberateness that every one felt that there stood before them a calm, self-poised, truthful man, whose evidence would go far to settle the minds of the jurors in this sensational case. There was a murmur as every one settled himself to drink in his testimony. "Now, sir," said the judge, "be good enough to tell the jury what you know about this important case." "I don't know anything about it," said the witness, blandly. "Don't know anything about it? Then why did you have yourself summoned as a witness?" "So as to get a good seat where I could hear and see everything—tickets wern't to be had for love or money."

THE SERENADE.

"I will stay," he sang, "and will sing my say,
  While slumber seals your eyes;
And the still deep night will see me stay
  Under the starlit skies,
I will wake and sing till the morning star
  Shall glow in the eastern sky."
But he didn't; her "pa" came out right thar,
  And "lifted" him nine feet high.



CRAVAT BOW.—FIG. 316.

A college professor encouraged his geology class to collect specimens, and one day they deposited a piece of brick, streaked and stained, with their collections, thinking to impose upon the doctor. Taking up the specimens, the professor remarked: "This is a piece of baryta from the Cheshire mines;" holding up another, "This is a piece of feldspar from the Portland quarries; and this," coming to the brick, "is a piece of impudence from some member of this class!"

BEAUTIFUL SKIRT.

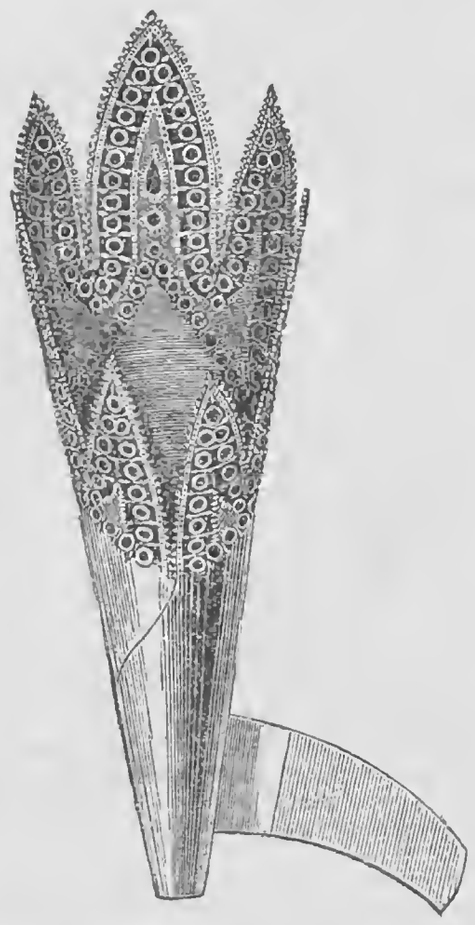
Oh, skirt! beautiful skirt!
Jerked through the dust and dragged through the dirt!
  Once you were white
    As the mantle of snow,
  And the leaves of the lily
    When spring zephyrs blow.
Stiff to the touch and fair to the eye,
Neat to the gaze of each passer-by;
  Now tattered and spattered—
    Oh! piteous wrong,
  Beautiful skirt,
    They made you too long.

It is reported that a reverend D. D. when passing along Church street, heard a woman shout out to her little boy (who was working in the middle of the street with mud and water), "You little devil, what are you doing there?" The D.D. who had been unperceived) went silently up to the woman and said, "Are you the mother of that child?" at which the reply was, "Yes." After viewing her from head to foot, he exclaimed rather loudly, "I never saw the devil's mother before," leaving the said devil's mother somewhat astonished and bewildered.

THE MAIDEN AND THE BEE.

"A cottagen leaned whispering by her hives,
  Telling her bees some news, as they lit down
  And entered, one by one their waxen town."
—*Jean Ingelow's "On the Borders of Cannock Chase."*

And presently a bee, a great big golden bee,
That appeared to be the watch-dog of the trea-sury,
Shot like a ball from out the waxen town,
And on the nose of cottager serenely sat him down,
Saying; "Excuse this liberty, O pretty maid divine,
But I have news to tell thee, in return for news of thine."
The maiden didn't linger long a-whispering to the bees;
But struck a frightful galopade, her hair upon the breeze,
And the howls that she emitted, as she danced and pranced and ran,
Were heard, the neighbors tell me, clear from Beersheba to Dan.—Cincinnati Enquirer.



BOUQUET HOLDER.—FIG. 317.

At a party not long since, where questions were asked, and facetious if not felicitous answers were expected, a coal-dealer asked what legal authority was the favorite with his trade. One answered, "Coke." "Right," said the coal-dealer. Another suggested, "Blackstone." "Good, too," said the questioner. Then a little hard-faced man in the corner piped out, "Little-ton." Whereupon the coal-dealer sat down without saying anything.

For Women.

CONDUCTED BY MISS RAY CLARK.

WEAVING THE WEB.

"This morn I will weave my web," she said,
  As she stood by her loom in the rosy light,
And her young eyes hopefully glad and clear,
  Followed afar the swallow's flight.
"As soon as the day's first tasks are done,
  While yet I am fresh and strong," said she,
"I will hasten to weave the beautiful web
  Whose pattern is known to none but me."

"I will weave it fine, I will weave it fair,
  And ah! how the colors will glow!" she said,
"So fadeless and strong will I weave my web
  That perhaps it will live after I am dead."
But the morning hours sped on apace;
  The air grew sweet with the breath of June;
And young Love hid by the waiting loom,
  Tangled the threads as he hummed a tune.

"Ah! life is so rich and full," she cried,
  And morn is short though the days are long!
This noon I will weave my beautiful web,
  I will weave it carefully, fine, and strong."
But the sun rose high in the cloudless sky;
  The burden and heat of the day she bore;
And hither and thither she came and went,
  While the loom stood still as it stood before.

"Ah! life is too busy at noon," she said;
  "My web must wait till the eventide,
Till the common work of the day is done,
  And my heart grows calm in the silence wide!"
So, one by one, the hours passed on,
  Till the creeping shadows had longer grown;
Till the house was still, and the breezes slept,
  And the singing birds to their nests had flown.

"And now I will weave my web," she said,
  As she turned to her loom ere set of sun,
And laid her hand on the shining threads
  To set them in order, one by one.
But hand was tired, and heart was weak;
  "I am not as strong as I was," sighed she,
"And the pattern is blurred, and the colors rare
  Are not so bright or so fair to see!

"I must wait, I think, till another morn;
  I must go to my rest with my work undone;
It is growing too dark to weave!" she cried,
  As lower and lower sank the sun.
She dropped the shuttle; the loom stood still;
  The weaver slept in the twilight gray.
Dear heart. Will she weave her beautiful web
  In the golden light of a longer day?

DESCRIPTION OF CUTS.

Fig. 316.—Cravat Bow. The bow is of ruby satin, dotted with cream color, but the design may be followed out in the use of many other colors and kinds of material. The above however, is one of the fashionable combinations.

BOUQUET HOLDER.—FIG. 318.

Figs. 317 and 318.—Holders for button-hole and girdle bouquets. These holders are made of heavy white paper, in the form of a cornflower. The cuts represent the natural size.

PIC-NICS.

Pic-nics are all well enough in their way, but why will people give them in such terribly warm weather.

I attended one a few years ago (don't imagine it was my first, for I have a long experience), and don't think I can be tempted to attend another soon. Up two hours earlier than usual, dressed "on time," swallowed a hasty breakfast and went off in a frantic hurry. It was a "church affair," so we repaired thither; finally the word was given and we were marched off, two-and-two, for a walk of at least a dozen squares, on the sunny side of the street (and it was just exactly three-quarters of an hour after the appointed time). Once on the boat, we really had a pleasant time, only landing every other square to wait for, and take on, belated pic-nicers. Then the singers got in a corner and murdered an innumerable amount of Sunday-school songs, and the enthusiastic base-ball players must have a game played over our heads.

All these, however, were trifles; you should have witnessed our landing, *that* was worth the pencil of Frank Leslie's, or some other, caricaturist. Such pushing, running and jumping; such a sudden display of activity by dignified elderly people was never before witnessed. If the captain had given us but three minutes to land in there could not have been more haste.

But it did not end there, for they went running and yelling along the sandy shore, like a lot of lunatics just escaped.

We had to walk the distance of about two squares in the hot sand, and then be pulled by the arms and pushed on the back up the most outlandish steep bank, where once landed in safety, many were off at a break-neck pace. Some of us were unfortunate, most especially I, for the young man below did not push at the right moment while the young man above pulled with a will, and as I am no fairy in weight the consequence was, the gent above took a seat suddenly, in preference to coming down face-forward, and I "bit the dust" in a manner neither graceful nor funny (to me at least). Helping hands were extended, and I was landed on terra firma with my hat jammed down over my face, my dress soiled, my fan broken and the sound of "giggles" in my ears.

These also were mere trifles; so brushing off the dust and squaring my hat, I trotted off with the rest.

We had barely reached the spot destined for our days pleasure (?) when some simpleton began pitching "bean bags;" this was splendid sport, we all agreed, and immediately formed into an immense circle, with a half-dozen bean bags flying around; for convenience we got into an open space, in the hot sun, of course, and I had forgotten my gloves. It was very pleasant and exciting at first; that tall young gentlemen *would* pitch the bags clear over my head, and away I would gallop, grab it—miss it—try again, and raise my head just in time to see another go whizzing by. My arms ached, the perspiration poured from my red face, but I was not going to be the first to give up, so I kept bravely on, and could not help feeling vexed when the handsomest gentlemen in the ring sauntered off with—I was going to say—the handsomest girl, but I take it back, for she had red hair and freckles; it was her *dress* that was the handsomest, and I don't care how much men may rave about woman's extravagance in dress, take nineteen men out of twenty, and put them in company with two young ladies, one intelligent and sensible, but plain in face and dress, the other gay, showy in dress and a regular flirt, to whom common sense is a stranger, and those nineteen men will all bow down and worship number two, leaving her companion to the twentieth man, who, I may as well remark, is not always to be found; he is a myth, generally speaking.

They will all tell you how much they admire and respect a plain, sensible girl, and all that sort of thing; but I am of the opinion that the reason so many plain, sensible girls are slighted is that the men who do it have not the *sense* to appreciate them.

But I am digressing! Dinner time came at last, and after choosing six or seven different places, we finally selected a spot on which to demolish the contents of our baskets. What a grand day it was for the bugs and ants! they came in whole droves, like "Parson Hardbake"—to "sample our cookery." The butter was melted to oil, there was too much water in the lemonade, some one got the cake I wanted, and above all, it was unmercifully warm.

Just as we got under full headway, the sun crept around the tree, and shone full in our faces, and we finished dinner under an umbrella. Then a kindly disposed person dropped a piece of ice down my back; it was cool, but decidedly uncomfortable if allowed to remain in one place.

After the feat of eating dinner was accomplished, another simpleton (they always attend picnics,) proposed games, and we commenced with "dropping-the-handkerchief." Round and round we ran having a "splendid" time, until one lady caught her foot, and measured her length on the ground; two gallant gents flew to her aid, and as they lifted her up, she hysterically gasped—"I'm not hurt!" I don't suppose she was; she had severely skinned her chin, knocked her nose a trifle to the left, and had her mouth full of dirt. But the poor thing had torn her dress and stained it with grass, besides knocking her hat entirely out of shape. She had courage worthy a better cause, for she made three more trips around the ring, and then went off for a "drink of water." I wanted a glass of water soon afterwards, and I just *happened* to to find her sitting on a log, crying dismally. Poor thing! I suppose she was tired.

Then a friend (?) asked us to go boating and we eagerly assented; we started happy, and came back miserable. Our feet were wet and muddy, our skirts draggled, and we had been in mortal terror of drowning. The sun glared on the water, the sentimental ones sang boat songs, and the oarsman splashed water on us.

And the swing; of course you must try that when you go to a picnic, even if you haven't been in one for ten years. How frantically I grasped the rope with both hands, how sick I was, and how those girls did laugh at me.

Thank heaven, it was over at last, and I was home, tired, sick, dirty, torn, draggled, and hungry, but telling every one I had had a splendid time. Need I speak of the next day, when I could not raise my hand to my head? You who have "been there," know how it is, so I refrain.

ALLINE RAY.

MISS IRENE'S IDEAS CONSIDERED.

I notice in the issue of Aug. 28, page 559, a brief article over the signature "Miss Irene." She seems to think "the majority of husbands are failures; although before marriage, angels."

Well now, I have been an old maid nearly thirty years; and for one of the best of reasons. I never had an offer, and yet I am cheerful and hopeful.

I am compelled to differ most respectfully, with old maid, No. 1, in nearly every other particular. I admit there are crabbed censorious husbands, but they are the exception. Nine-tenths of the husbands in the circle of my acquaintance, (I wish

I had one) are entirely different from Miss Irene's *expressed* views of them.

I do not believe, that tillers of "Mother-earth" are thereby made heartless and rough. I can hardly credit Miss Irene's sincerity when she says, "that is the principle reason she did not marry some years ago."

It has been said, that old maids are the salt of the earth. In a certain sense it may be true, but the trouble is that somehow or other too much pepper or mustard gets into the salt. Perhaps in Miss Irene's case, this discovery was made by somebody? before he was caught, and he respectfully discontinued his amour'—— and it seems Miss Irene failed in all her modest, maidenly attempts to "bring him back to a realizing sense of his sin of omission."

Miss Irene uses strong language; every sentence has snap in it. She speaks of "thousand wants, sleepless nights, anxious days, husband cross as sin, struggling with dirt, &c., and one nervous little woman to wrestle with it all." Oh my!!

Now I mistrust, just a little, that Miss Irene, even now at this late day, (if she had an opportunity) would take the chances and wrestle with them all manfully, rather than to wrestle all alone with her dear self, I know I should.

Miss Irene closes her talk on what she "knows about husbands, (she don't know anything) in this language. "Ah! some of these husbands deserve —— deserve to be in hearing of an old maid's voice, at its crucifying pitch, once a week."

Facts prove, that men choose to remain in celibacy, or go to purgatory than to run the risk of tying themselves to screeching, toothless, one-eyed, cast-iron old maids. OLD MAID, No. 2.

New York.

DINNER HINTS.

THE laying-out or decoration of the dinner-table may be considered more a matter of taste than of etiquette; but still there are certain things which ought to be attended to.

Whether the dinner be a large or small one, luxurious or plain, absolute cleanliness is the first essential. The linen should be spotless; the cloth itself smoothly laid, and free from creases or wrinkles; the napkins neatly, but not elaborately folded; the glasses, spoons, forks, knives, brightly polished; the plates and dishes without a speck. No one thing adds so much to the enjoyment of a dinner as this. A zest is given to the homeliest of food, while the richest and costliest of dishes are spoilt by an untidy plate, a stained or a tumbled tablecloth, or imperfectly-cleaned knives and forks.

The dining-room should be well, but not too brilliantly, lighted. It should be comfortably warm, but not hot, or many guests may experience discomfort before the meal is over.

The word "cover," in the phrase "covers were laid for six or twelve," signifies the appointments placed on the table for the use of each of the guests. These, in large and small dinner-parties, consist of:

Napkin at each place.
A tablespoon for soup.
A silver knife and fork for fish.
Two large knives.
Three large forks.

Sometimes a tumbler or goblet is added; but it is more usual for these to remain on the sideboard in readiness to be handed to a guest if asked for. The silver knife for fish is not essential, but it is a great comfort and convenience.

Knives, forks, and spoons for dessert do not form part of the cover. They are not placed before the guests until the dessert is about to be handed round.

It is probable that more than two large knives and forks will be wanted, but it is not usual to place more than three, including the fish-knife, when the table is set out. Extra knives and forks are kept in readiness, and are handed to the guests as they are required.

The knives and forks should never be placed lengthwise on the table, but in a position ready for use at each side of the place to be occupied by the plate.

ABOUT WOMEN.

THE Queen of Spain lately gave birth to a daughter.

MRS. PROFESSOR CORSON, of Ithaca, N. Y., will have charge of the art department in Wells College this year.

MISS MYRA REYNOLDS, valedictorian of the last class at Vassar College, has been selected to fill the position of teacher of English.

THE marriage of the Baroness Burdett Coutts will probably not take place before six or seven weeks from now. It is doubtful whether Mrs. Money, her sister, will consent to allow her to remain at the head of Coutt's Bank after the marriage.

A FREE excursion to Rockaway was given recently to the New York sewing girls by the owner of the Grand Republic. The steamer was well filled with many hundreds of these girls and their friends, who enjoyed a rare day of happiness, such as comes not often in their monotonous life.

CORRESPONDENTS' CORNER.

To the Editors of the RURAL NEW YORKER:—I have been a reader of your paper since January last and am well pleased with it, and having seen the cut of those fans No. 258 in the issue of August 7th, I would like to know where I can get one and what it will cost for one or both. Please answer as soon as convenient. From a well wisher and constant reader. J. B. F.

[The feather fan mounted on pearl can be obtained for $10.75; on bone for $2.75. The smaller one for 50c. We will purchase for you if wished.—Eds.]

Please tell us through your paper where we can buy linen thread and braid for braiding patterns, white, gray or brown. I take the RURAL in connection with Ehrich's Fashion Magazine. The seeds you sent 1879; the Acme tomato and Beauty of Hebron potato were of real value to us.

Wishing you all success,

N. Y. J. M. L.

[The braid and thread can be purchased at almost any fancy store, and no doubt can be secured by applying to Ehrich's.]

No one can be sick if the stomach, blood, liver and kidneys are well. Hop Bitters keeps them well.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

IT is a popular idea that no apples will make jelly but crab apples, and I give as my own opinion that the Siberian Crab stands first for fine color and its own peculiar flavor. But when this cannot be procured it may be unknown to some housekeepers that any red-cheeked, tart apple, especially the Famcuse, Strawberry and others of that quality and color, can be utilized in this way, the smallest specimens serving for this purpose. Indeed, when peeling large apples in quantity, the *skins*, if peeled rather thick, are useful for making a very fair jelly, though it seems unnecessary so to use them when they make such fine, pure vinegar. I know a noted housekeeper who lives within earshot of that Great Babel where the RURAL is published, who, by keeping a jar for apple parings, never buys vinegar, although she puts up large quantities of pickles. The vinegar was a very pale red and of fine flavor, while it was safe from the many adulterations to which this useful condiment is subjected. Apple parings, warm water with a very little brown sugar and a weight to keep the ingredients under cover, that was all that was necessary and it certainly is a great saving where much vinegar is used. Speaking of pickles, I suppose every one knows that nasturtium seeds, and green and unripe pods of radish seed are a great addition to the pickle jar, as are also bits of the outside stalks of celery, adding a flavor that is otherwise unknown.

DOMESTIC RECIPES.

Cider Jelly for the Sick.

One pint of clear sweet cider, one package of Cox's gelatine, two pounds of white sugar, one pint of cold water, one quart of boiling water, juice of two lemons and the grated rind of one. The gelatine must be soaked in the cold water one hour. To this add the sugar, pour over it the boiling water, stir until dissolved, pour in the cider, strain through a flannel bag, wet your glasses or molds in cold water, pour in the jelly, and set away to cool; make several hours before wanted for use. This also makes a very nice dessert for persons in health. MARY B.

To Color Butter.

The bought coloring matter that I have used for several Winters, I have always mixed in with the cream just before churning. The past Spring when complaining to a friend that while we had beautiful golden butter, our buttermilk was so yellow that we did not care to drink it or use it for cooking purposes, she asked why we mixed it with the cream at all? Why not color the salt? I must confess I had never thought of this before, but since I have tried it, I see no reason for returning to my old method. The deepness of color of the salt must depend upon the lack of color in the butter. Thoroughly incorporate it with the butter—it does not show the color at once—let stand over-night and in the morning just work it through before packing or making into prints. MRS. L. BRADY.

Rolled Jelly Cake.

If Mrs. C. C. will try the following recipe for jelly cake, I do not believe she will ever again think her cake not as nice as she has eaten. Beat the yelks of 12 eggs with one pound of pulverized sugar, add the whites beaten to a stiff froth with three-quarters of a pound of flour, which has been sifted three or four times. The whites and flour should be stirred in alternately, a little at a time. Have some shallow tin-pans, 12 by 18 inches and an inch deep; line with thin, brown paper—do not grease—pour in batter, spread out with a knife and bake in a good oven. When done take out, let it get somewhat cool and turn out upside-down. Wet the paper with a soft cloth dipped in water and pull off. Spread with jelly and roll up, being careful to place the outer edge against something so that it will not unroll. Sprinkle with powdered sugar. Use no baking powder, as that makes it too brittle to roll. The paper lining should be larger than the pan so that you can take hold of it in turning out.

That Jelly.

I should advise bringing it to the boiling point, letting it rest two or three minutes; turn out and stand in a *cool* place. MRS. L. J.

Canning Tomatoes.

Fifteen years' experience in canning tomatoes has taught me a few things which, perhaps, the ladies of the RURAL would like to know. First,—the tomatoes should not be over-ripe; they should be firm enough to pare with a sharp knife, and should not remain off the vines over-night before being used. Do not scald them to get the paring off, as that alone will help to start fermentation. I always select for canning those that are yet green near the stem. Boil until heated thoroughly through; turn into any good self-sealing glass (I prefer the Little Mason); screw down the lid as tightly as you possibly can immediately, and if, when cold, you can tighten it more, do so. Set in your cellar and keep from the light; and your tomatoes will come out as fresh in January as when put in, and not have that half-sour taste which Mary Wager-Fisher's had. JANE D. M'ELRATH.

To Clean Zinc.

Put on the zinc a little sulphuric acid and rub over with a cloth so that every part is wet. Afterward wash off with clear water, and then the zinc will be bright and clear.

Pickled Peaches.

Take fine free-stone peaches, rub with a woolen cloth to remove the down, and put into a brine made of one-half cup of salt to a gallon of water—it should be cold—and let stand nine days. Then wipe them dry, pack in a jar, and cover with cold vinegar (spiced if you choose). When wanted for table halve them, removing the stone, and sprinkle with sugar. I think them very nice.

MRS. M. A. PARSONS.

Tomato Catsup.

Scald and run through a sieve half a bushel of tomatoes. Add three tablespoonfuls of salt, one tablespoonful of red pepper and one of black pepper, three tablespoonfuls of mustard, two of cloves, one of allspice, one pint of vinegar, two green peppers and two onions chopped fine. Put cloves, allspice, peppers and onions in a muslin bag; put all in a kettle and simmer four hours, or until as thick as desired.

Chili Sauce.

One dozen fair-sized onions, twenty-four ripe tomatoes, four teaspoonfuls of salt, eight of sugar, three of ground cloves, four of cinnamon, two of ginger, one of ground black pepper, two of mustard, two and one-half cups of vinegar. Chop tomatoes and onions fine, add spices; boil two and a half hours. Add vinegar, hot, after the ingredients have boiled one hour.

Sugar Cookies.

One cup of butter, three eggs, one cup of sugar, one teaspoonful of baking powder sifted into flour; enough flour to roll out thin. Flavor with lemon, vanilla, or nutmeg.

Clove Cake.

One cup of sugar, one of molasses, one of milk, one of lard, one of raisins, one teaspoonful of cloves, one of cinnamon, two of baking-powder, two eggs; flour to thicken about as ginger-bread.

Ginger Snaps.

One pint of molasses, one cup of shortening, one cup of brown sugar, one tablespoonful of soda, one-half cup of boiling water, two tablespoonfuls of ginger. Mix stiff and bake in a quick oven.

Molasses Cake.

One teacupful of molasses, one egg, one teaspoonful of soda, one cup of sweet milk, one of shortening. Mix enough flour to make of right consistency.

Mountain Cake.

One pound of flour, one of sugar, one-half of butter, one cup of sweet milk, six eggs; beat whites separately, two teaspoonfuls of baking powder. Bake as jelly-cake, with icing instead of jelly. MRS. NICHOLS.

QUESTIONS ANSWERED.

Crystallizing and Coloring Grasses.

WANTED—Recipes for the above.

D. H. BILLINGS.

ANS.—For coloring grasses we have found nothing better than Leamons' Aniline Dyes. As to crystallizing them, we gave directions in RURAL of Oct. 18th, page 680, 1879, which we will republish. They are as follows:—

Dissolve 18 ounces of alum in a quart of water, heating it over a slow fire in a covered tin, and stirring it occasionally with a stick until dissolved. When nearly cold, suspend the grasses to be crystallized by a thread from a small stick laid across the mouth of a deep glass or earthen jar into which the solution is poured. Let remain in the alum water 24 hours; take out and suspend in the shade to dry. The crystals will be larger if the solution is allowed to become almost cold before putting in the grasses.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,

Several stores in Denver, Col., were damaged by fire to the extent of $60,000 on the 22d.....William Evans was instantly killed on the 22d in a colliery near Pottsville, Pa., by a fall of coal.... ... At the wedding reception of Dr. Simeon Denton and bride, of Hancock county, Ill., some of the invited guests were dangerously poisoned. The theory is that a drug was introduced into water, of which they drank freely. Medical aid was summoned and antidotes were administered. Some were alarmingly ill and vomited blood, but no deaths.....The Cheyennes are again reported to be in a threatening attitude in the Indian Territory.....The fourth annual reunion of the Army of West Virginia was largely attended at Parkersburg.....Mrs. Leonora Borg and three children were poisoned by eating smoked salmon in New York on the 22d. One child may die.... ....The body of one of the men killed in the Hudson River tunnel was found on Tuesday evening. Little more than the skeleton was left..... Silas M. Waite, the absconding President of the First National Bank of Brattleboro, Vt., whose defalcation amounts to $450,000, was captured at Omaha on the 21st.. .....The first order for silver certificates based on a gold deposit in New York was received by the United States Treasurer on the 22d. It was for $25,000, the certificates to be paid in St. Louis at the Sub-Treasury.....Sadie White, aged 19, a daughter of Hugh L. White, of Richmond, Ky., and generally designated as "The Belle of the Blue Grass Region," committed suicide on the 22d, by cutting her throat, while temporarily insane.....John C. Cahill, late postmaster at Bucatunna, Miss., was arrested on the 23d, by Post-office Inspector John A. Galbreath, charged with opening registered letters from his office; also with paying debts and buying goods with postage-stamps, contrary to the law forbidding postal employes to do so.....The Indiana Encampment, G.A. R., and the Soldiers' Reunion, convened in Indianapolis on the 22d.....At Las Vegas, Col., Sept. 22, Samuel Matthews, while under the influence of liquor, killed a lady acquaintance and committed suicide. No cause for the act is assigned.....The pickets at Corning, Ohio, were fired upon by the strikers on the 22d. They returned the fire, but, as far as can be learned, no one was injured. It is said most of the miners living at Corning would return to work at the sliding scale of prices but for fear of vengeance from their associates in the miners' union. At the suggestion of the Sheriff of Perry county the New Lexington Guards, who had a skirmish with the strikers on Sunday last, were relieved from duty and ordered home. The two other militia companies will remain on duty for the present.....The centennial celebration of Maj. John Andre's capture at Tarrytown, N. Y., occurred on the 22d. The day was celebrated by the ringing of bells, salutes from men-of-war in the harbor and cannon on the hill-tops and a grand procession, including the 71st and 22d New York regiments, the 7th brigade of the State militia, and the Hartford (Ct.) foot guard. There were also exercises in a big tent, Samuel J. Tilden presiding, Orlando B. Potter reading a historical sketch and Chauncey M. Depew delivering the address. A bronze statue of a revolutionary soldier will be unveiled on the spot where Andre was captured.....The 12th reunion of the army of the Cumberland opened at Toledo, Ohio, on the 22d, some 500 members being present, including Gens. Garfield, Sheridan, Prouty, Cist and Meissner.

At the School Commissioners' election at Binghamton, N. Y., 147 women voted.....James S. Grover, a prominent citizen and merchant of Oak Creek, Wis., hanged himself, on the 20th.... ....J. Tarault'z's stove and hardware factory at Graytown, O., was destroyed by fire, on the 20th. Loss, $20,000; insurance, $8,000.....Internal Revenue Deputies Lowe and Eliot report from Calhoun county, Alabama, that they attempted on the 19th to arrest Joseph Little for illicit distilling, when the latter thrice shot and badly wounded Lowe.....A committee of prominent lawyers at St. Louis, after examining the law on the subject, has reported that Oklahama is public land, and comes within the pre-emption and homestead laws..... The King & Curtis elevator at Kellogg, Ia., worth $11,000, was burned on the 19th, together with 10,000 bushels of wheat and 4,000 bushels of corn. Insurance, $4,000 on the building and $1,000 on the grain.....The Cabinetmakers' Union furniture factory and lumber yard at Tell City, Ind., together with a number of small dwellings occupied by workmen, were destroyed by fire on the 18th. The lumber was valued at $50,000. The total loss is placed at $200,000.....It is said Major Walsh, of the Manitoban mounted police, has secured Sitting Bull for three years for a company of Canadians, who propose making a tour of the United States and Canada with him, commencing on the 1st of January. He will appear in a border-life drama.

The Presbyterian church at Green Bay, Wis., 60 dwellings, some of them the best in the city, and 30 barns were burned on the 20th, the flames only stopping at the river; loss $170,000, insured..... Memphis celebrated the continued good health of the city with a business and trades procession over three miles long.....Western Reserve college at Hudson, Ohio, with an endowment of $250,000, is to be removed to Cleveland and its name changed to Western Reserve University, to secure $500,000 offered to it by Amasa Stone of Cleveland on those conditions... .....Mrs. Hazzard of Monticello, Ill., gave birth to five babies on the 18th. They are all alive..... ...October 2d has been fixed for the laying of the corner stone for the obelisk in Central Park, New York. The Masons have been invited by Grand Master Anthony of New York to turn out en masse..... The soldiers' monument in Antictam cemetery was unveiled on the 17th with imposing ceremonies and in the presence of a large number of spectators. Mr. M. Brosius delivered the oration..... There has been a very heavy increase in exports at New York recently. Last week the amount was $12,798,658, more than five millions greater than for the corresponding period last year.....Two Indians, a Navajo and a Ute, in New Mexico, became enamored of the same maiden. To settle the vexed question they resolved to imitate the white man, and had recourse to a duel with knives. One was killed and the other seriously wounded..... Boston celebrated her 250th birthday, on the 17th, in a big, hearty and successful manner. The Journal says of it: "The weather was all that could be desired, the crowds were immense and orderly, very few intoxicated persons were visible day or night, good nature generally prevailed, even in the most densely crowded streets, the procession started promptly on time, and the whole affair was creditable to the city."

At the depth of 1,400 feet an artesian well at Little Rock, Ark., has developed a strong vein of salt water which rises to a hight of 700 feet in the well.....Work on the harbor at Michigan City is rapidly progressing. This movement will help make that port one of the most important on the lakes, and nearly the entire lumber shipments of the South will be transferred to the railroads centering there.....Howard and Denig, contractors for the new Indiana State House, are paying all their employes in gold. The men at the Statehouse building numbering 200, were, on the 10th, paid their wages for the month of August, amounting to $7,000, in gold. An additional $5,000 of the same coin, just from the mint, has been provided for the pay-rolls at the brickyard and the stone quarry.

The contract for the monument of the late Senator Morton of Indiana, to be set up in Indianapolis, has been awarded to Simmons, of Rome. His model is represented as standing on a granite pedestal, and on the steps of the monument proper the Goddess of Liberty sits holding the American flag half-furled. This figure is to be removed on the suggestion of the committee, On three sides of the square laurel wreaths are entertwined with the Union Jack, and on one is a cannon and sword. Morton is represented as speaking, with his right hand in gesture, dressed as he was accustomed to dress, in a frock coat. The cost of Simmon's statue will be about $20,000.....The earnings of the different railroads throughout the United States for the month ending with July were $29,000,000 larger than for the corresponding period of last year.....The Texas Pacific railroad has inaugurated a grand immigration scheme and proposes to bring from Europe this year 10,000 German and Scandinavian farmers to settle upon its lands.

Larkin G. Mead, sculptor, has just shipped to America the models for the two remaining bronze groups for the Lincoln monument at Springfield, Ill. He is now engaged on studies for a statue of General Sutter, the California pioneer, at whose mill gold was first discovered in that State, and who was recently buried at Litiz, Pa. .....Mr. Mead is also modelling a colossal figure representing the Mississippi River, which is to be presented to the city of New York as an additional embellishment to Central Park by Mr. Elliott F. Shepard. The figure, which is a reclining one surrounded by fruits and animals, is to be executed in white marble.....A gang of five tramps attacked a party of emigrants bound for Kansas, who were camped about 12 miles north of Columbus, and in a skirmish Andrew Mably, one of the emigrants, was shot through the hand. One of the tramps was mortally wounded and carried off by his comrades.

Next Monday, Oct. 4, Mrs. Amelia Lewis will lecture on food and cooking at the Y. M. C. A's Hall, Fulton St. corner of Gallatin Place, Brooklyn, at 8. P. M. Admission 50c. Mrs. Lewis is an English lady who has invented a new system of cooking and is the author of several works on that and kindred subjects.

POLITICAL.

The October elections are expected to give a pretty certain indication of how the presidential election will result.....Georgia will elect, on Wednesday, October 6, State officers and a Legislature, which will choose a United States Senator. It should be noted that Georgia will not elect its Representatives in Congress at the State election, but will choose them on Tuesday, November 2.....Indiana will elect, on Tuesday, October 12, State officers, Representatives in Congress, and a Legislature, which will choose a United States Senator.....Ohio will elect, on Tuesday, October 12, minor State officers, Representatives in Congress, and a Legislature, which, in the case of the election of Gen. Garfield as President, will choose a United States Senator.....West Virginia will elect, on Tuesday, October 12, State officers and a Legislature, which will choose a United States Senator. The people will also vote upon two proposed amendments to the Constitution of the State—one relating to courts, and the other to the right of trial by jury in certain cases. As in Georgia, the Representatives in Congress in West Virginia will be elected on Tuesday, November 2.....It may be added that the town elections in Connecticut will be held Monday, October 4, and that a proposed amendment to the Constitution of the State will be submitted to the vote of the people, the amendment providing that hereafter Judges of the Supreme Court of Errors and of the Supreme Court shall, upon nomination of the Governor, be appointed by the Legislature.

[Rochester Sentinel.]

"Buckwheat Cakes and the Measles."

When a young husband had gone from home and with fond solicitude telegraphed his little wife, —"What have you for breakfast, and how's the baby?"—he received the brief, suggestive reply,— "Buckwheat Cakes and the Measles." We have the report of a case in our midst, not where Measles was in the bill of fare, but where Sciatic Rheumatism confined Mr. J. Dawson, the well-known druggist, to his room for a long period. It was stated to our reporter in the following words: The senior of this firm was attacked with Sciatic Rheumatism December last, and for four weeks could scarcely leave his room. He used St. Jacobs Oil, and is now able to be at his place of business, feeling no worse for his recent affliction. The inference is convincing.

AGRICULTURAL NEWS.

There are now in use in New Zealand, which, not so very long ago, was the subject of Sydney Smith's familiar joke about cold curate on the sideboard, 5,000 reaping machines and more than 1,000 thrashing machines, of which 374 are worked by steam power.....It has been estimated that of the horses in the world Austria has 1,367,000; Hungary, 2,179,000; France about 3.000, 000; Russia, 21,470,000; Germany, 3,352,000; Great Britain and Ireland, 2,255,000; Turkey, about 1,000,000; the United States, 9,504,000; the Argentine Republic, 4,000,000; Canada, 2,634,000; Uruguay, 1.600,000.....The Mark Lane Express of the 20th, in its review of the British grain trade the past week, says: "Rains and floods have greatly damaged the crops still standing in the North of Scotland. As thrashing proceeds it is found, in the midlands especially, that the yield of wheat is considerably below anticipations formed during the brilliant harvest weather. This caused growers to be bolder in resisting a decline. A decided reaction has taken place, raising values one shilling to two shillings per quarter both in London and the country. The supplies of home-grown wheat were comparatively light, but parcels suitable for milling sold readily. Larger millers, however, have not shown such inclination to increase their stocks as they would have done if the improvement in price promised to be the first step to a prolonged rise. There is not much chance of prices attaining but a very moderate level if only subject to the legitimate influences of supply and demand, as the American surplus far exceeds the estimated Old World deficiency. Arrivals at ports of call have been small. There has been considerable business in wheat, both for Great Britain and the continent. Prices steadily advanced, red winter closing 1s 3d@1s 8d and Australian is dearer on the week. Maize was in moderate request at about 3d advance. American red winters generally held above buyer's views, but there has been an occasional advance of 1s per quarter for special shipments. Barley quiet. The sales of English wheat during the week were 44,524 quarters at 39s 11d, against 13,214 quarters at 47s 4d for the corresponding period last year. The imports into the United Kingdom during the week ending September 11 were 1,939,021 cwt of wheat and 240,012 cwt of flour..... Tobacco raising in Pennsylvania has not been carried on many years, but is assuming large proportions. The estimates for the season reach 100,000 cases of 400 pounds each, of which Lancaster county claims 40,000 to 45,000; York, 18,000; Chester, 10,000; Bucks, 5,000; Lebanon, 5,000, etc. Last year's crop amounted to 80,000 cases—about $5,000,000 in value. The plant is chiefly grown in small fields, from half an acre to a few acres each, in some instances reaching 50 to 60 acres. The yield is said to be 1,300 to 2,000 pounds to the acre in most cases, in some instances reaching 2,400 pounds, and realizing about 13 cents per pound, on an average. At this rate the 40,000,000 pounds of this year's growth would amount to $5,200,000. .....The value of breadstuffs exported during eight months ending August 31 amounted to $181,-856, 766, against $137,914,047 last year..... ...Wheat exports in August were 21.787,475 bushels, or 777,-356 less than same month last year.....Corn exports in August were 8,532,180 bushels, or 3,847,-837 more than corresponding month last year.... ....Flour exports in August were 502,858 barrels or 46,500 more than in same month of 1879..... The stock of lard in New York on September 15th, was 32,373 tierces, and at Chicago 75,914, making a total at these two principal points of 108,287 tierces, against 116,220 at New York and 97,850 at Chicago a year ago—a total of 214,070. Decrease, 105,783 tierces.....The International Corn Market was opened at Vienna, Austria, on the 16th inst. Statistics of the crops of the Austrian Empire estimate their condition, taking 100 as the average, as follows: wheat, 98, rye,97; barley, 109; oats, 107. The quantity available for export, reckoned in centals, is estimated 6,000,000 rye, 5,000,000 wheat, 4,000,000 oats.....A despatch from Alexandria, Egypt, reports that the rise in the Nile is quite up to the average, and the prospects of the crops are very satisfactory.....It is estimated that 16,000 people are in absolute need of food in Western Kansas, owing to the failure of crops there this year and last. Assistance is urgently needed and sought in their behalf.... ....A couple of French peasants discuss the fertility of their respective provinces. "At Bordeaux," said one, "if you let a match fall to the ground the next year there will grow up a forest." "At Marseilles," cried the other triumphantly, "you let a suspender button fall, and in eight days you will have a pair of pantaloons ready made."..... The Fiji Islanders, who, up to six years ago, when England adopted them, were cannibals, and indulged in fricaseed traders, with cold missionary on the sideboard, have become so civilized that they wear clean shirts on Sunday, sing hymns, and eat yams and beefsteak like any orthodox Christian. What with cocoanuts, cocoanut fiber, cotton, sugar, and coffee to export, and a luxuriant soil to grow all these products in, the colony ought to have a grand future.

"Maud S." beat "St. Julien" and his remarkable record of 2.11¼ Saturday week, trotting a mile at Chicago in 2.10¾. Her second quarter, made in 30¾, was also the fleetest on record.....Parts of Kansas have been visited by vast clouds of butterflies. They settle in every yard where there are trees, making them look as though the leaves are brown with frost. There are millions of them, of large size, with long, black bodies and brown spotted wings.....The largest sugar producer in Louisiana made last year on 3,200 acres 6,480,000 pounds of sugar and 7290 barrels of molasses, for which he received over half a million dollars. The largest wheat raiser in the world, Dalrymple of the northern Red River country, raised a crop of wheat which sold for $450,000, but it took 23,000 acres of land to raise it on, nearly six times as much as was required to raise the sugar and molasses.....The Gardener's Monthly says the original Seckel pear tree stands on the farm of Mr. Bastian, on the "Neck," between the rivers Delaware and Schuylkill, below old Philadelphia. The tree is a mere shell, about 150 years old, but yet bears a few pears.....The receipts of grain at New Orleans for the year just closed were 8,745,119 bushels of corn and 4,541,393 bushels wheat, against 3,912,569 of the former and 1,643,287 of the latter in 1879.....The assessed valuation of property in Nebraska is $90,000,000,, and out of a total of about 46,000,000 acres it appears that 13,000,000 acres, or nearly one-third the whole amount is now in private hands. The State is rapidly filling up with an enterprising and intelligent class of farmers and others.....An epizootic disease has attacked nearly all the horses belonging to the horse railroads and omnibus companies of Boston and a great many private horses also. The distemper is spreading quite rapidly. It is accompanied by a low fever, and inflammation of the throat and air passages.....An agent of the Delaware Beet Sugar company, with headquarters at Wilmington, Del., has been in Oswego N.Y., trying to buy any beets grown there this season. The people of Wilmington have $100,000 in the enterprise.....The Produce Exchange of this city has addressed a letter to Secretary Sherman stating that the receivers and exporters of butter find that the statistics as to the quantity of actual butter exported are seriously at fault by reason of large exports of oleomargarine as butter. The Exchange informs Mr. Sherman that he would confer a favor not only upon the Exchange, but upon the entire dairy interest of the country, by giving directions to have oleomargarine cleared as such, and not as butter...

...English statisticians say that England will pay $60,000,000 less for foreign grain during the coming year than was paid in the crop year just closing Even with a favorable harvest, however, Great Britain grows but one-half of the wheat it eats and the London Times, more in earnest than in jest, says the English farming, a-field and in the dairy, will shortly be a pursuit which wealthy men may indeed keep up for their amusement, but which no sane man will pursue for profit.....

Great Distress

is often suddenly experienced from an attack of cramp in the stomach, colic or other painful affections for the relief of which nothing is superior to Dr. Pierce's Compound extract of Smart-Weed, or Water-Pepper, compounded from the best French brandy, Jamaica ginger, smart-weed, or water-pepper, and anodyne gums. For diarrhœa, dysentery, bloody-flux, cholera-morbus, its warming, soothing, astringent, and heating properties render it a perfect specific, unsurpassed as an anodyne and stimulating embrocation or liniment. Should be kept in every family. Sold by druggists at fifty cents.

$200,000 Worth of Rifles—The Largest Transaction in Sporting Arms on Record.

A NOTEWORTHY EVENT TO ALL SPORTSMEN.—The Evans Rifle Co., manufacturers of the world-renowned twenty-six-shot Evans rifle (whose factory at Mechanics Falls has been complimented by both American and foreign manufacturers as the most extensive and complete in the world), have taken a signal, and in the face of the advance in fire-arms, a most commendable step. The Evans is the most expensively made, and has hitherto been the highest-priced of all Magazine or Repeating Rifles, embodying as it does a marvelously ingenious action. The Evans is the only repeating-arm in existence carrying cartridges in its magazine for a whole day's sport, and having that magazine entirely concealed within itself *and in the stock*, where the weight should be, not under the barrel, varying the "hang" of the arm with every shot. The Evans Rifle Company have run their factory to its utmost capacity for the past two years, and have thereby accumulated an immense stock of rifles, made at the lowest possible figure obtainable under the most favorable circumstances. The price of the Evans has hitherto been $40 and upwards, and it is well worth it; but now the Evans Rifle Company propose, though it is in the face of a fierce opposition to the trade, to reduce the price of their arm to $18 and $20, thus placing the finest and most complete repeating rifle in the world on the par (pecuniarily) with a common single-shot rifle.

The Evans Rifle Company have transferred their entire product to the warerooms of the well-known Boston house of G. W. Turner & Ross, whose facilities for conducting this immense sale are unsurpassed, and through that firm will be offered over six thousand of the new and latest improved model Evans rifles at half former prices, and the sportsmen of all countries will not be slow in taking advantage of the offer. We refer the reader to the advertisement and the testimonials of such well-known shots as A. J. Boyd, Texas Jack, and others.

"Good Literature."

Is the name of a new weekly paper, about the size of the New York Daily Sun, the first number of which appeared September 23. It aims to be more a literary *news*paper than any of its contemporaries (or any of its numerous dead predecessors), and proposes to depend upon its readers for support instead of upon the advertising patronage of publishers, which is supposed to have been the life-blood (or poison) of literary papers heretofore. No advertisements will be admitted, and no gratuitous specimen copies of books for notice accepted. The editors propose to *buy* the books they write about, and "will try to tell readers of good books what they want to know, that is worth knowing, about books and living literary workers." The price is quite as astonishing as the scheme—50 cents a year—and it is hardly necessary to add that the paper emanates from "The Literary Revolution" headquarters, The American Book Exchange, Tribune Building, New York.

"TYPE SETTING BY STEAM,"

Is one of the items which has helped to spread the fame of "The Literary Revolution," during the past year. While this process has been largely used, much the larger portion of its publications have been produced by the old hand-work methods, machinery not being best suited to all classes of work. Another innovation which will add to the reputation of the "Revolution" and interest many readers, is the establishment of a large printing house in which the work, excepting a portion of the heavy manual labor, will be done exclusively by women. The American Book Exchange will win many good wishers because of this new departure.

A Successful Dairyman

is the one that makes uniform "gilt-edged" butter the season through, and sends his butter to market in perfect condition. The best dairyman all through the country have by long and varied experience found that there is no article so perfectly adapted to keeping up the golden June color, now absolutely necessary in order to realize the best price, as is Wells, Richardson & Co.'s Perfected Butter Color, made at Burlington, Vt. Buy it at the Druggists, or send for descriptive circular.

MRS. LYDIA E. PINKHAM, 233 Western Ave. Lynn, Mass., is rapidly acquiring an enviable reputation for the surprising cures which daily result from the use of her VEGETABLE COMPOUND in all female diseases. Send to her for pamphlets.

$500 will be paid for any case that Hop Bitters will not cure or help. Doubt not.

To Housekeepers.—The attention of heads of families is respectfully invited to the superior quality of BURNETT'S FLAVORING EXTRACTS. They are entirely free from the poisonous oils and acids which enter into the composition of many of the factitious fruit flavors now in the market. They are highly concentrated, have all the freshness and delicacies of the fruits from which they are prepared, and are less expensive.

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

Until Saturday, Sept. 25.

Boston.—BUTTER—Fine butter is scarce, and commands extreme prices, and the best Vermont September made sells at 30c. Northern—Choice creamery, 30@32c ₩ lb; choice New York dairy, 27@29c; choice Vermont, 28@30c; long dairies, 25@27c; common, 17@19c. Western—Choice creameries, 29@32c ₩ lb; fair to good, 26@28c; dairy-packed, 22@26c; choice ladle-packed, 20@24c; common, 17@20c. CHEESE—We know of some fine cheese that cannot be bought below 13¼c, but at the same time very little is sold at this figure, and 13@13½c is as high as buyers are willing to pay. Fine factory, N. Y. and Vt., 13@15¼c ₩ lb; fine factory, Ohio and West, 12½c; fair to good, 11@12c; skims, 7@8c. EGGS.—Eastern, 19c ₩ doz; New York State, 18½@19c; Canadian, 18@18½c; P. E. Island, 18@18½c; Western, 15@17c; egg oats, 36c. POTATOES.—The demand is almost wholly for Rose, which have sold at 50@55c for York State, Vermont and New Hampshire stock, and 55@60c for Maine Central and Houlton. White potatoes have sold down to 45c, and there is not much call for them. Sweet potatoes are in good supply, and the market is dull at $2.25 per bbl for good ones, while poor stock sells lower. ONIONS show no change, and the market is quiet at $3 for yellow and $2.50 per bbl for red. GRAPES are plenty and dull at 4@5c for Concords and Isabellas, 6@7c for Catawbas, and 7@8c for Delaware. APPLES are in abundant supply, and with the exception of choice eating fruit, prices rule low, and $1@1.25 is the price of good shipping apples. A few Cape cranberries have been received, and sell at about $7 per bbl. PEARS range from $2@3.50 per bushel, and choice Seckels will bring $4. Tomatoes are 30@50c a bushel box, according to quality.

Chicago—WHEAT dull; No. 2 red winter, 92@92⅛c.; No. 2 Chicago spring at 90½c. for cash; 90⅝@90¾c. for October; 91⅛@91½c. for November. CORN active at 39⅝@39¾c. for cash; 39@39¾c. for October, 40⅛@40½c. for November. OATS unsettled at 29½c. for cash; 29¼c. for September, 28½c. for October; 28¾c. for November. RYE easy at 83¼c. BARLEY firm at 77c. PORK irregular at $17.75@18 for cash; $18 bid for September; $17.80@$17.90 for October; $12.80 for November. LARD unsettled and lower at $7.67½ for cash and bid for October, $7.85@7.87½ for November. BUTTER—Choice to fancy creamery 29@30c. ₩ lb; fair to good 26@28c.; fine to fancy dairy 23@25c.; good to choice do. 19@21c.; medium to fair do in shipping lots 16@17c.; good to choice ladle-packed 17@20c.; fair to good packing stock, 15@18c. We quote: Full cream, 11@12½; Part skim, 10@11; Full skim, 8½@9¼; Low grades, 6@7. POTATOES—Early Rose were quoted at 40@50c. in lots. Farmers are not bringing in so many, and this gives outside shippers a better chance. Sweet potatoes were in good request at $2.75@3.75 per doz. SEEDS—Timothy strong and in active request. About everything in the way of cash seed taken, and the quality of some lots was quite poor; futures were also in demand. The market was so much better that former asking prices could be easily obtained. Cash, sales were made at $2.25@2.35 for poor to fair; good to prime seed sold at $2.38@2.40, a high grade to very choice recleaned ranged at $2.42 to $2.48; seller September sold in settlement at $2.40; a few cars of seller October were sold at $2.35. Clover ruled dull and nominal; quotations ranged at about $4.50@4.75 for old medium. Flax was in good demand; prices were a shade better and sales were liberal: a good share of the business done was on speculative account; sales were made early at $1.22, on a basis of pure; later at $1.23@1.24, and some at $1.24½, with a high grade at $1.25.

Cincinnati. WHEAT dull; No. 2 amber, 93@95c; No 2 red winter, 95@96c. CORN dull; No 2 mixed, 44c. OATS easy; No. 2 mixed, 32@32½c. RYE dull and drooping; No. 2, 91@92c. BARLEY easier; No. 2 fall, 92c. PORK dull at $16. LARD steady at $7.90@$95. BULK MEATS quiet; shoulders, $5.50; clear ribs, $8.65. BACON in fair demand; shoulders, $5.25; clear ribs, $9.25; clear sides, $9.75. BUTTER—Fancy Creamery sells at 32c, and prime at 30@31c, choice Dairy at 25@27c, choice Western Reserve at 23@25c, prime to choice Central Ohio at 18@21c, and common at 14@16c ₩ lb. CHEESE—There has been a good demand all the week and the market is steady and firm for prime factory at 12½@13c ₩ lb. Some choice mild do. sells at ½c more. SEED—The demand for Timothy continues good, but it is not as brisk as it was a week ago; the market is firm, however, at $2.60@$2.65 ₩ bushel for prime to choice from store, and dealers buy at $2.40@$2.45 for car lots on arrival. CLOVER is quiet; dealers buy round lots at 8c, and small sales are made at 8¼@8½c ₩ lb from store. Dealers buy Flaxseed at $1.00@$1.10 per bushel. POTATOES—The market is quiet at 45@50c ₩ bushel for choice Early Rose on arrival and $1.50@$1.60 ₩ bbl in prime shipping order from store.

St. Louis.—WHEAT.—No. red winter 84½@85. CORN.—No. 2 white 39½. OATS.—No. 2. 29¼. RYE.—No. 2. 85½. BUTTER.—Quiet, but steady; supply scant of desirable grades. We quote: Creamery—choice 30@32c; off-stock at 29@30c; dairy—selections of choice at 26@27c; fair to prime medium 18c to 23c; low 13@15c; near-by country—poor 12@13c; choice 18c to 20c. POTATOES. Unchanged; at 45c per bushel sacked and $1.35 per barrel for Rose or Peerless. Near-by growth in larger receipts—sold mainly at 45@47c. APPLES.—Market almost glutted with small poorly packed, and undesirable shipping fruit; and, as there is little or no sale (no demand whatever for this class of stock, it is almost worthless; choice large red well packed or Bellefleur, meanwhile find sale. Ben Davis at $1.75@1.85, Bellefleur $1..0@1.70, other choice shipping varieties at $1.25 to $1.50. Sales: 200 barrels various at $1.40 do at $1.15 54 choice do at $1.25 del. 100 do do at $1.25 to $1.40.50 Roman Beauty and Redstreak at $1.60, 40 bris choice Roman Beauty at $1.75. PEACHES.—Receipts light. GRASS SEEDS.—Timothy in good demand and steady, at $2.25 for fair to $2 35 for strictly prime in car lots. Sales: 193 sks at $2 28 184 at $2 31, 267 at $2 32, 190 and 77 p. t. 199 at $2.32½, 20 at $2 37, 20 at $2.40. Other seeds neglected. Clover nominal at $4.99. Seed inspection (and grading) has been established in the St. Louis market, to take immediate effect.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 25. 1880.

BEANS AND PEAS.—The bean market shows no animation; buyers seem awaiting the new crop. White Kidney and pea bean scarce and nominal. Red kidneys dull and mostly of low grade. New not likely to open high. New green peas dull at $1.50@1.55; quality against sales. B. E. peas have fallen to $2.50 per 2 bushel bag.

Marrow beans, prime, $1.65@1.67½; other, $1.50@1.60; mediums, new, $1.55@1.60; old prime, $1.45@1.47½; other, $1.30@1.40; pea $1.55@1.70; white kidney, $1.70@1.80; red kidney, prime, $1.40@1.45; other, $1.30@1.37½.

BEESWAX.—There is little doing with the market unsettled; quoted 23@24½c. for Western and Southern.

Exports for week 1,800 lbs.

BUTTER.—Last prices have been well supported, but the sales at the close have not quite the free or wholesale character of a portion of last week. The scarcity of creamery is its main feature of strength, and many first-class buyers are turning their attention to the fine ends of half tubs and other pails. For this reason selected tubs are quoted higher than before, and sellers are reluctant to break off such tops, even though the new prices have a favorable sound. Cutting up dairies or lots is a bad habit to encourage, but with the busy season coming on sellers dare not risk the loss of a customer. If the latter is allowed to shop much at this season he may stumble upon a nice little line that might make his absence felt for some time. Both State and Western are above steady or speculative export trade. The quality of State is remarkable even as a bulk thus far, as will be seen by the close range. Western brings good figures, being enough under State to attract the market trade and grocers who retail in populous wards where taste is not very discriminate and a few cents is an important feature.

Creamery, fine State, 31@33c.; fine Western, 31@32c.; all good to prime, 29@30c.; fair to good, 27@29c.; poor to fair, 26@27c.; sweet cream, 27@30c.; State firkins, 24@28c.; pails and half tubs, choice, 28@29c.; good to prime, 26@27c.; poor to fair, 25@26c.; Welsh tubs, choice 26@27c.; other, 22@25c.; Western imitation creamery, 24@25c.; dairy, fresh, 24@25c; other, 16@23c.; factory, fine June, 20c.; present make, 18½@19½c.; poor, 16@16½c.

Receipts for week, 33,072 pkgs.; exports do., 9,685 pkgs.

COTTON.—The activity on speculative account has been more general, and dealings in spot rots fair, with prices closing firm.

Latest prices are for September, at 11.71c.; October, 11.20@11.21c; November, 10.99@11c.; December, 11@11.01c.; January, 11.11@11.13c.; February, 11.27@11.28c.; March, 11.42@11.44c; April, 11.57@11.58c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9 7-16	Middling	11 3-16

Receipts for week, 21,894. Exports do. 17,517.

CHEESE.—The market has worked a little better this week under a stronger export demand and more moderate receipts; 13¼c. is general on fancy factories at the close. The shipments for the week are 46,239 boxes. Quotations are for State factory, fancy, at 13½c.; do. good to prime, 12¾@13c.; do. fair to good, 11½@12½c.; do. half skimmed, 9¾@10¼c.; Wisconsin factory, fine, 12¾@13c.; do. good to prime, 12@12¾c.; do. fair to good, 11¼@12c.; Ohio factory, fine, 12¾@12¾c.; do. good to prime, 11¾@12c.; do. flat, fair to good, 10½@11¼c.; do. poor to fair 9¾@10¾c.

Receipts for week, 68,828 boxes; do. last week, 42,-640.

Exports, 43,194 do.

Liverpool cable, 64s.

Steam to Gt. Britain, 35s.

DRIED FRUITS.—Apples have rather more attention, especially sun-dried lots, for which prices are very steady. Peaches are quiet and unchanged. Small fruits are firm and in demand.

Apples—Old State at 5¾@6½c., new Tennessee at 3¾@4c.; new Virginia at 4@5c.; fancy sliced North Carolina at 6@7c.; evaporated, ring cut, at 8½@9¾c. Old peeled peaches at 8@14c. Blackberries at 8c.; Raspberries at 25@26c. Pitted cherries at 19@20c. Whortleberries at 11c. New Georgia peeled peaches at 16@17c.; new North Carolina peeled peaches at 18@20c.; new unpeeled peaches, quarters at 7½c.; new unpeeled peaches, halves at 8c.

Receipts for week, all kinds, 2,350 pkgs.

Exports for week, 326 bbls. of apples.

It is expected that a higher grade of apples will be wanted for export use this year than formerly.

EGGS.—Receipts for the week, 8,400 bbls.; do last week, 7,100 do. The demand has run remarkably steady with the high prices that have ruled. Canadian and Western form the main supply. States not turning out well. At the close extra fresh Ohio held for 21c.

Near points, 20@23c.; State and Pa. 20½@21½c.; Western and Canadian choice, 20@20½c.; second quality, 19@19½c.

FLOUR.—There has been freer sellers, and prices tending easier on the larger receipts,

Latest prices are: $3.25@4.05, for very inferior to very fancy superfine State and Western; $3 90@4.15 for poor to choice extra State and Western, odd lots and lines; $4.15@4.25 for choice to fancy do.; very inferior to good white wheat, trade and family extras, $4.65@5.50; good to choice do. at $5.60@6.00; (very choice to fancy do. at $6.10@6.35;) red and amber winter wheat inferior to choice trade and family, at $4.25@5.85; round hoop Ohio, $4.25@4.85; and trade and family brands of do. at $4.70@5.85; St. Louis at $4.65@5.40 for inferior to good extra; $5.25@5.85 for good to choice (and $5.85@6.25 for choice to fancy brands); Minnesota clear, inferior to fancy at $3.90@5.25; Minnesota "straight," poor to fancy, at $5.75@7.25, and patent inferior to very fancy at $5.75@6.60; unsound stock at from $3.25@4 85; city mill extra at $5.00@5.25 for fair to very choice for the West Indies; do. for England, $3.90@4.25 for poor to choice spring wheat, and $4.40@5.40 for winter wheat product; do. trade and family extras, $5.25@5.50; do for South America, $5.25@5.65; No. 2 at $2.25@3.50 for very poor to very fancy.

Receipts for week, flour, bbls. 100,650; corn meal, do. 4,175; wheat, bush. 1,492,500; corn, do. 2,195,800; oats do. 271,700; rye, do. 98,250; malt, do. 23,160; barley, do. ——; beans, do., 2,288; rice, pkgs. 2,500.

Exports for the week, flour, bbls., 83,200; corn meal, do. 5,560; wheat, bush. 1,483,722; corn, do. 715,210; oats, do. 4,500; peas, do. 2,775; beans, do. 781; rice, 1,000,

CORN MEAL.—Sales at $3.25 for Brandywine, and $3.50@2.75 for Western.

FRESH FRUITS.—Exports of apples for week, 17,200 bbls. Green lots dull; red sorts firm with a good shipping call.

Mixed Western $1.25@1.50; Fall pippins $1@1.25; Baldwins $1@1.50; greenings 75c@$1; King and Detroit Red, $1.50@1.75; Twenty Oz., $1.50; Gravenstein, $1.50@2. The season has opened up some very acceptable table varieties of attractive color in commercial quantities. Cranberries in light demand and tending lower. Fancy Cape Cod $6.50 ₩ bbl.; poor to choice, $4.50@6; Cape, boxes, $2@2.25; N. J. do. $1@1.75. Quinces in better stock; common $2.50@3; prime $3.50@4, which is lower. Peaches have no offering to speak of; cull 75c. ₩ basket; prime to extra $1@2. Pears are fairly steady. Boston sends almost all the Bartletts, quoted $4@5 ₩ bu. box; Seckles, choice $8@10; common, $4@6; Duchess, Louise bon and B. Dial $4@5; Beurre d'Anjou, $4@6; B. Bosce and B. Clairgeau, $5@8; cooking $2@3. Plums hardly of account; crates 75c.@$1.75 as to quality. Grapes are in good demand and plenty enough to rule cheap. Delaware, cases 18 3-lb boxes $3,50@4; in baskets ₩ lb 6@8c.; Catawbas, cases 18 3-lb boxes $2.50@2.75; baskets ₩ lb 4@5c.; Concords, cases 18 3 lb boxes $1.50@2; bulk ₩ lb 2½@3½c.; Isabella 3c. Salem 5@6. There is more demand for peanuts at late prices; Va. hand picked 5½@5¾c.; extra prime 4½c.; good to prime, 4@4½c.; shelled 5½@5¾c. Chestnuts $6@7 ₩ bush.; Northern better than Southern.

GRAIN.—Wheat has an active demand; the shipments for the week reach 1,350,000 bushels; prices are unsettled.

The latest sales are of No. 1 white at $1.07½@1.08½; do. September, at $1.08; do. October, at $1.06¾@1.06¾; do. November at $1.07@1.07½; do. steamer grade at $1.06@1.06½; No. 2 white at $1.07; ungraded white at $1.01½@1.10½; mixed Winter at $1.04¼@1.05; No. 1 red at 1.10¾@1.11; No. 2 red at $1.06@1.07; do. September at $1.06¾@1.06¾; do., October, at 1.06¾@1.07; do. November, at $1.08@1.10½; December, at $1.09¾@1.09¾; do., steamer grade, at $1.03; No. 3 red at $1.03½@1.04; ungraded red at $1.10¾@1.11; No. 2 Chicago spring, old crop, at $1.04¾@1.05 Rye at 91@93c. Corn is freely offered and closed weak; latest prices are of New York No. 2, at 50¾@50¾c.; do., September, at 50¾c.; do. October, at 51¾@51¾c.; do., November, at 52½@52¾c; do., December at 53c. bid and 53¾c. asked; ungraded mixed Western at 50@51c.; No. 2 white at 52¾c. Oats are at lower prices, with free sellers; latest sales are of No. 1 white at 45¾@46c.; New York No. 2 white at 44@46c.; No. 3 white at 42@43½c.; New York No. 1, 45@46c.; No. 2 at 45@45c.; do., for September at 43¾@44c.; do. October, at 38½@38¾c.; do., November at 38½c. No. 3 at 42@43¾c.; ungraded White Western at 42@46½c.; ungraded mixed Western at 41½@44c.; white State at 46c.; No. 3 Chicago quoted at 44@45c.

HAY AND STRAW.—There is very good demand and prices strong.

Shipping hay quoted at 80c.; medium to prime do., 90c.@$1.15; salt hay at 60@65c.; clover do. at 65@75c. Straw at 90@95c. for long rye; 65@70c. for short rye; and 60@70c. for oat.

Exports for week 2,677 bales.

HOPS.—The offerings are somewhat freer and brewers buy a little more freely, with prices steadily. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	27 @30
Do. medium	25 @26
New Yorks, crop 1880, low to fair	23 @24
Eastern, crop 1880	23 @27
Wisconsin, crop 1880	23 @27
Yearlings, crop 1879, choice	23 @27
Olds, all growths	4 @14

HONEY.—Quoted as before, with an offering exceeding wants of trade.

White clover, comb, single, 17@18c.; larger pkgs, do. 15@16c.; buckwheat 12@13c.; extracted 8@12c. as to color.

POULTRY AND GAME.—Fair prices still rule for dressed; near points not so firm as good State lots are coming, which are very useful for general trade. Geese are in market, but too early for ready sales. Western fowls and chickens low, not doing much better than live.

Turkeys, choice, 15c., ₩ lb.; fair to good, 13@14c; Phila., dry-picked, 15@17c. Chickens, do., 16@17c.; Bucks Co. do. 14@16c.; State scalded, 11@12c.; Western, scalded, 11c. Fowls, Phila., dry-picked, 15c.; N. J., d.-p., 13@14c.; scalded 12@13c.; State, d.-p. 11@12½c.; State, scalded, 11@12c; Western, scalded, 11c.; poor, 9@10c. Ducks, Spring d.-p., 13@15c.; mixed, 11½@13c. Squabs, white, ₩ doz., $2.50; dark, $1.12@1.37. Geese, Phila. per lb 15@16c.; poor, 9c.

Liberal supplies of crops are coming from all points, and the market is very soft. Turkeys run small Geese easier; ducks steady.

All game has an easy time. The weather is treacherous for holding and bad for display.

Mallard ducks, 50c.; teal, wood and common 20@30c. Partridge, prime, $1 25; soft, 50@75c.; grouse, $1.12@1.25; woodcock, 60@75c.; Eng. snipe, ₩ doz., $1.50@1.75.; Sand snipe, 40c.; plover, $1.50@1.75; yellow legged snipe, large $1.50; small 40c.; reed birds $1.25; black 25c.; wild pigeons flight $1.25; stall-fed, would bring $1.75; venison plenty demand, only fair. Short saddles 16@18c.; whole deer, 10@12c.

PROVISIONS.—Hog products have been fairly active and closed easy.

Mess pork at $15.25 for spot lots; $14.90 for Sept. and Oct., deliveries. Bacon at 8-85c. for long clear, and 9¼c. for short clear. Beef at for extra India mess quoted at $19@20 for city; $10 for extra mess and $9.50 for plain mess; $10.50@11 for packet, and $11.50@12 for family mess. Beef hams at $16.50. Lard—Western steam at 8.32½@8.35c. for spot lots; 8.35c. for Sept.; 8.30c. for Oct; 8.25 for Nov. Stearine at 8% for prime. Tallow at 6¾@6 7-16c. for prime.

Receipts for week, beef, 1,475 pkgs.; pork, 450 bbls.; cut meats, 27,100 pkgs.; lard, 11,125 pkgs.

Exports for week, beef, 1,200 bbls.; pork, 2,950 bbls.; cutmeats, 6 893,427 lbs.; lard, 1,154,750 lbs.

TOBACCO.—Export demand is fair and home trade more active, with prices firm.

VEGETABLES.—Exports of potatoes for week, 6,656 bbls. In effect the market is better for buyers, as they have an advantage in quality at former prices. Only best packed, round hoop Early Rose make the extreme, $1,62@1.75; fair to good, $1,25@1,50; peerless, $1@7.25 Sweet potatoes easy, with a large supply. Cabbages lower. There is a weak feeling in onions. Eastern stock sells quicker than State.

Green corn, ₩ 100, 50@75c.; tomatoes, ₩ bush., 25@30c.; cucumber pickles, per 1,000 $1.50@2; egg plants, per bbl., $1@$1.50; Lima beans, per bag, 75c.@$1.25; shelled, per bush. $2.50; turnips, 100 bunches, 50@60c.; Russia turnips ₩ bbl, 50@87c. beets, 100 bunches, $1@125; bullnose peppers, ₩ bag, 75c.@$1; cabbage, flat Dutch, ₩ 100 $2@3.50; red do., $3@5; marrow squash, ₩ bbl. 50@60c.; onions, white, $3@4, yellow, $2.75@3; red, $2.50; carrots, ₩ 100 bunches, $1,50@1.75; pumpkins, ₩ 100 $3@5; okra, 20c.; cauliflowers, ₩ bbl., $2@4; celery, per dozen, 75c.@$1.

SEED.—Clover is quiet at 8¼@8¾c. Timothy quoted at $2.50@2.60. Flaxseed is steady at $1.40.

Receipts for week, 8,893 bushels.

Exports for week, 160 bags.

WOOL.—There has been a better demand through the week and prices generally steady and without change from last week.

LIVE STOCK MARKETS

NEW YORK, Saturday, Sept. 25, 1880.

BEEVES.—Receipts for the week 12,749 head; do. last week 14,542 do. Good to choice cattle were in light supply and firm; very choice touching 11c.; common and low grades weak and in buyers' favor in all instances of closing sales. Native cattle were so easy in price that Texas stock which usually furnishes the cheap trade was neglected at 6½c. for very fair lots. Old oxen, heifers and dry cows sold at 7@7½c. to dress. 55@55 lbs.; poor to fair native steers, 7@9c.; to dress 55@56 lbs., good to choice, 9¼@10¼c., to dress 56 lbs.; and about a carload of extra at 10¾@11c., to dress 57 lbs.

COWS AND CALVES.—Receipts are moderate and prices are firm. Supplies were sold early at a range of $30@50 per head, the latter for single selected. Good stock steadily quored at $50@55.

VEAL CALVES.—Choice quality calves have been scarce and wanted; good under grades of fed fairly steady. Buttermilk and grass dull.

Live calves, N. J., fed 7@7¼c., State choice, 5½@7c.; poor, 4½@5c.; Mt Holly, large, 5½@7c.; buttermilk, 2½@3c.; grassers 1¾@2c.; fair to prime hog dressed 7@10c.; common, 4@6c.

SHEEP AND LAMBS.—Receipts for week, 35,189 head; do last week, 40,012 do. Market for sheep quiet and and barely steady at 3¾@5¾c. Lambs firm with a moderate supply at 5@6c.

SWINE.—Receipts for the week, 25,034 head; do. last week, 19,669 do. At the yards rates were firm and a fraction above earlier sales. Corn quoted $5.40@5.70; rough heavies $4.80; N. J. dressed heavy to light 7¼@8¾c.; State do 7¾@8½c. City dressed declined on change to 6¾@7¾c., heavy to pigs.

Remember that a little Hop Bitters saves big Doctor bills, and cures when all else fails.

Reading for the Young.

RHYMES AND ANIMALS.

I STRUNG the following rhymes together to tickle the ears of my little boys, four and six years old. They tease their mamma to read them over and over again, and then fetch the big illustrated dictionary to have her point out the funny animals with such strange names and tell what she can about them. This fancy for rhyme and rhythm is, I suppose, a characteristic of nearly all children, and perhaps the publication of this will amuse a wider circle than my little household. The aim has been, after euphony, to have the most incongruous animals in juxtaposition:

Alligator, Beetle, Porcupine, Whale,
Bobolink, Panther, Dragonfly, Snail,
Crocodile, Monkey, Buffalo, Hare,
Dromedary, Leopard, Mudturtle, Hare,
Elephant, Badger, Pelican, Ox,
Flyingfish, Reindeer, Anaconda, Fox,
Guineapig, Dolphin, Antelope, Goose,
Hummingbird, Weasel, Pickerel, Moose,
Ibex, Rhinoceros, Owl, Kangaroo,
Jackal, Opossum, Toad, Cockatoo,
Kingfisher, Peacock, Anteater, Bat,
Lizard, Ichneumon, Honeybee, Rat,
Mockingbird, Camel, Grasshopper, Mouse,
Nightingale, Spider, Cuttlefish, Grouse,
Ocelot, Pheasant, Wolverine, Auk,
Periwinkle, Ermine, Katydid, Hawk,
Quail, Hippopotamus, Armadillo, Moth,
Rattlesnake, Lion, Woodpecker, Sloth,
Salamander, Goldfinch, Angleworm, Dog,
Tiger, Flamingo, Scorpion, Frog,
Unicorn, Ostrich, Nautilus, Mole,
Viper, Gorilla, Basilisk, Sole,
Whippoorwill, Beaver, Centipede, Fawn,
Xantho, Canary, Polliwog, Swan,
Yellowhammer, Eagle, Hyena, Lark,
Zebra, Chameleon, Butterfly, Shark.

—W. H. K., in Cincinnati Gazette.

BOUQUETS OF AUTUMN BERRIES.

MAUDE MEREDITH.

CRIMSON and gold, crimson and gold,
When the Summer's wane, and the days grow old,
When the crickets cry in the reedy ways
And the Autumn drapes with her mist of haze.

The old anecdote of the boy who wished that each season as it came "would always last," has been sometimes quoted as an example of the fickleness of human nature, but foolishly so, as each season holds its own peculiar charm, so much so that we never could wish any season to make haste to pass, and yet the joy of each one is enhanced by its coming and going, by its changing, shifting panorama. The soft warm breath of Spring, the glowing heat of Summer, falling hot and still on the dense green of the forest trees, and the long lances of the fragrant fields of corn, the gorgeous coloring of Autumn boughs swinging low with ripened fruits, and brown nuts beating a soft tattoo on the dry earth. Even the storms of Winter, through which comes the jingle of sleighbells, and the laughter of home returning schoolboys, all have their varied fascination, and add to the joy of nature's lovers, and the name of her worshipers is legion.

We have been away over the hills through field and wood in search of our Winter bouquets. Not the grasses of which we gathered great store in the full beauty of meadow and sedge, but the hardy Autumn berries, that defy the early frost and cling to their branches long after the foliage lays in heaps and wind-row, by fence and moss-grown hollow.

Brightest and best for Winter bouquets is the climbing bitter-sweet, celastrus scandens, whose

CLIMBING BITTER SWEET.—FIG. 319.

capsuled berries, of a brilliant, waxy scarlet with coverings of orange, brighten not only their native hedge-rows and forests, but, transferred to the parlor mantel, light up as a minature "burning bush," to which it is closely allied. Euonymus Americanus, being a shrub, from two to five feet in hight, called also bitter-sweet or burning-bush, from its brilliant appearance in the early Autumn. These berries once gathered are a "joy forever," as time has but little power to destroy their beauty. They loose, to be sure, much of their glossy freshness, but sufficient brilliancy of color remains to make them useful in filling up boquets of grasses or grains. In and out among the flowery foliage of the woodbine hide the purple clusters, minatures of the royal fruit that gladdened the heart of

"—The homeward turning Jew
When Eschol's clusters on his shoulders lay,"

and swinging in their slender red stems, are very pretty but fall to quickly if cut for ornament.

The woodbine, also, called Virginia creeper, is called by botanists, ampliopsis quinquefolia, and no longer confounded with the poison ivy as formerly.

Next we find the black alder, prinos verticellatus, as it is called. It is a native of our woodlands, a trim, upright shrub, of about eight feet in hight, the bright, scarlet berries clinging all Winter to the naked twigs.

"O'er yon low wall, which guards our unkempt zone,
Where vines and weeds and scrub oaks intertwine,
Safe from the plow, whose rough discordant stone
Is mossed to one soft gray by lichens fine,
The tangled blackberry, crossed and recrossed weaves
A prickly net-work of ensanguined leaves;
Hard by, with coral beads, the prim black alders shine."

The native dog-wood, cornus stolonifera, are dotted over with a small, white berry, that we gather to relieve the blaze of our red clusters and bring out the shades of the purple woodbine.

This shrub is sometimes called red osier and red twigged dogwood, on account of its red bark, which makes it very conspicuous when the leaves

VIRGINIA CREEPER.—FIG. 320.

have fallen. Here comes a spray of American holly, ilex opaca. Residents of our eastern coasts know more particularly of the beauty of this plant, as the Christmas festivities approach, as its handsome, glossy leaves and bright scarlet berries light up the churches and homes with an aspect of beauty strongly contrasting with the snow and ice outside, making real the old English song:

"The mill-wheel's frozen in the stream,
The church is decked with holly;
The mistletoe hangs on the garden wall,
To 'fright away melancholy."

The useful barberry, b. canadensis, also contributes some of its violet colored fruit to our already half-filled basket.

A few clusters of rose hips, though they lose much of their beauty in drying, and some of the little apple-like fruit, the thorn, will finish our collection for this time, except as we pass the old garden on our homeward way, where we stop for the beautiful white wax balls, called by some snowberry, symphoricarpus racemosus, that swing half the Winter over the mossy garden wall. A half hour spent in arranging our gleanings will add beauty to the unoccupied nooks and corners of the room.

"As on the ground of somber fir
And azure studded juniper,
The silver birch its buds of purple shows,
And scarlet berries tell where blooomed the wild sweet rose."

SEPTEMBER DAYS IN IOWA.

AGAIN the golden apples swing on the heavy laden boughs, and the grapes cluster on the vine, sending a rare spicy fragrance far beyond the vineyard, through the quivering sunlight. The bird songs are hushed, save here and there the shrill call of a bevy of querilous jays, still darting about the oak branches like brilliant flocks of lapiz lazuli, that awaken remembrances of the melodies of June, for

Once again September sun has spread
Her veil of amethyst above our head,
And, touching summers fading robe of green,
With fleck of crimson here, and gold between,
Has, by the highways all her warriors stood,
Brave golden rod, and asters of the wood,
And garnered in her wreath of golden grain
From breezy upland or from blossoming plain,
Her task fulfilled, her labors wholly done,
Behind her all the seasons victories won,
With folded hands she stands, and grand,
And smiles with gladness on the restful land.

The woodbine trails its blood-red banners against the brown rock on the river side, and the fisher-boy shoots his skiff under the overhanging grape vines, and drops the purple clusters into his white splint baskets until, heavily loaded, he drifts homeward in the sunset, catching the echo of shouts and laughter as a crowd of jolly boys fill huge sacks with black walnuts, butternuts and hickory nuts, in anticipation of the long winter evenings.

The wild plum spreads the ground in crimson and gold of luctous fruit, where the busy housewives gather up their winter store of preserves and plum butter, which old Dolly draws home in the heavy express, long since innocent of paint or varnish. Each housewife wears the spacious brown sunbonnet—log-cabin—one the exact counterpart of the other; but nature is prodigal with her gifts, and hearts are full and happy. Has not the same wagon, with quilts for cushions, and an abundance of straw on the bottom for softer stowage of the little boys, taken all the family to the fair? Grandpa and grandma on the middle seat, father, mother and little Jennie in front, Hattie and the two grown girls on the back seat, and the little boys in the soft (?) corners. Once at the Fair Grounds the wagon found lodgment in the rapidly filling semi-circle. Dolly and Jim are tied to the hind wheel, the bag of oats brought from under one seat, a basket of lunch from another, the white cloth spread, and the fair is a picnic also. But the picnic proper is the "Harvest Home," and oh! the "Harvest Home" among the merry Hawkeyes! The velvet green of meadows, the gold of grain stubble far away on all sides. In the stillness of the oak groves the squirrel hies away with a long ch-u-r-r, and the great black walnuts in their plump green rinds, play a heavy bass to the light trebble of the dropping acorns. The scarlet crab apples gleam from out the thickets, and in the fence corners, where droops the crimson tiped sumac, the prairie hen calls her mother brood. Away in the blue the silvery cloud lands lie, and over all falls the amber sunshine of September.

All over the land the year holds up her hands filled with her products, and we say "a fair." Fair has it been? Ay, to some all years are fair, but others there is ever the sound of sobbing rain drops and dripping eaves. M. M.

LETTERS FROM THE COUSINS.

DEAR EDITOR:—My paper came to-day; the dear old RURAL. How glad I was to see it again I got excited over its arrival, and behaved quite childish, no doubt, in the estimation of my less interested neighbors here.

I have been reading the Free Plant and Seed Distribution; well do I remember my first packet of Chinese Pink seeds. I now have a most beautiful bed of the plants, all in bloom, from seeds I have carefully saved every year.

I have not been able to plant and care for all the seeds that the RURAL has sent me, and I have exchanged some with my friends.

A few days ago I saw the Hollyhocks in blossom, and lovely, indeed, they were.

I have about sixty varieties of annuals this Summer.

I intend exhibiting some of my plants at the fair to be held the 21st, 22d and 23d of this month. We shall also exhibit the Golden Rural Tomato, the Ovoid Mangels, and probably some of the Beauty of Hebron potatoes, all from the RURAL'S Free Seed Distribution.

I have a beautiful bed of scarlet geraniums in blossom; cutting came originally from the RURAL

Thanks to the donor, and may God bless you, is the wish of your friend. MARY WALEY.

Connecticut.

DEAR UNCLE MARK:—We did not get our seeds planted very early and the dry weather prevented their growing very well until August, when the Summer rains came, and then they grew finely. We are going to have a larger and nicer garden next year. If you will come down here we will show you how things grow in the Sunny South. You must not come until the frost nips the chills. Give our love to all the cousins.

VIRGIL, EUGENE, ELLA, MOLLIE and TULULA
Burleson Co., Texas. HERRON.

DEAR UNCLE MARK:—I am a little girl six years old. Papa takes your good paper, says he cannot do without it. I like to read the letters and I want to join your club. I mean to have a garden next year, and will you please remember me when you send seeds. I have a little sister three years old, and a little brother sixteen months old, he is full of mischief. My grandma helps to take care of him. This is my first letter, I hope you will print it, as I want to surprise my papa. LIZA G. POWELL.

Steuben Co., N. Y.

The Puzzler.

HIDDEN ISLANDS.

Neighbor Neold is gone.
Suma trap that dog.
Did the bride sing?
A melitas maniac.
Cap ever deny it?
Cana rye is tall.
Must Helen answer?
Meuncey, London is a great city.
As great a crime as murder.

☞ Answer in two weeks. JAYHAWKER.

ACROSTICAL ENIGMA.

My first comes in the murmering breeze.
My second sits in his chair at ease.
My third assists the young and gay.
My fourth prefers in crowds to stay.
My fifth is near my lady love,
My sixth's at home in realms above.
My seventh is seen in waters clear.
My eighth remains with kings, I hear.
My whole is missed altho' 'tis near.

☞ Answer in two weeks. MARY WALEY.

A DIAMOND PUZZLE.

1, A letter; 2, to speak falsely; 3, inflamed; 4, an andiron; 5, a hotspur; 6, the sacred book of the Boodhists: 7, pertaining to dower; 8, to receive; 9, a letter. GUS.

☞ Answer in two weeks.

DIAGONAL PUZZLE.

1, A consonant; 2, a French pronoun; 3, a sort of rose; 4, lazy; 5, a stream of water. Primals and diagonals form two animals.

☞ Answer in two weeks. LITTLE ONE.

A SQUARE.

1, A berry; 2, the first vertebra of the neck; 3, to mend; 4, to make; 5, a plant. G.

☞ Answer in two weeks.

PUZZLER ANSWERS.—Sept. 25.

DIAMOND PUZZLE:—

      G
    G E M
  G E N E T
G E N I S I S
  M E S N E
    T I E
      S
```

HIDDEN BUILDINGS.—1, Mill; 2, capitol; 3, barn; 4, store; 5, shanty.

DROP LETTER PUZZLE.—"All is not gold that glitters."

CROSSWORD ENIGMA.—Pomegranite.

TENNYSONIAN ENIGMA.—"He makes no friends who never made a foe."

Sabbath Reading.

SOME TIME.

SOME time when all life's lessons have been learned,
And sun and stars forever more have set,
The things which our weak judgments here have spurned,
The things o'er which we grieved with lashes wet,
Will flash before us, out of life's dark night,
As stars shine most in deeper tints of blue:
And we shall see how all God's plans were right,
And what seemed most reproof was love most true.

And we shall see how, while we frown and sigh,
God's plans go on as best for you and me,
How, when we called He heeded not our cry,
Because His wisdom to the end could see;
And e'en as prudent parents disallow
Too much of sweet to craving babyhood,
So God, perhaps, is keeping from us now
Life's sweetest things because it seemeth good.

And if, sometimes, commingled with life's vine,
We find the wormwood, and rebel and shrink,
Be sure a wiser hand than yours or mine
Pours out this potion for our lips to drink;
And if some friend we love is lying low,
Where human kisses cannot reach his face,
O, do not blame the loving Father so,
But wear your sorrow with obedient grace!

And you shall shortly know that lengthened breath,
Is not the sweetest gift God sends His friend,
And that sometimes the sable pall of death
Conceals the fairest boon his love can send;
If we could push ajar the gates of life,
And stand within, and all God's workings see,
We could interpret all this doubt and strife,
And for each mystery could find a key.

But not to-day. Then be content, poor heart!
God's plans, like lilies, pure and white unfold,
We must not tear the close-shut leaves apart,
Time will reveal the calyxes of gold:
And if, through patient toil we reach the land
Where tired feet with sandals loosed may rest,
Where we shall clearly know and understand,
I think that we shall say, "God knew the best."

THE VOICE OF CONSCIENCE.

A PRACTICAL point is the duty of keeping conscience alive and tender. It is the will of God that we should have this testimony of approval, which indeed will sustain us in every good way, will encourage to perseverance, and will comfort in trial. Nothing, save the approbation of God, exceeds the value of an approving conscience; in fact, the voice of an enlightened conscience is the voice of God within us, His word echoed in the heart. On the other hand, it is God's merciful provision that this voice warns us against sin, deters us from evil purpose; or, if we have done wrong, reproaches us as guilty, and so leads us with true contrition to that fountain where all sin may be washed away. St. Paul describes it when he said "I exercise myself" to keep a conscience void of offence toward God and men. This exercise grows into a habit of godliness. Whereas to tamper with conscience or to silence its voice leads to hardness and impenitence of heart, with readiness for all evil.

Another duty is to be tender towards the consciences of others. The apostle gives many directions as to this in regard to those who are true believers. For instance, some may imagine that the Divine law prohibits certain things which it really does not. We are not to urge a weak or less instructed brother to violate his conscience by imitating our freedom, and so sin against light which he possesses. The noble spirit of St. Paul decided in such a case to deny himself in lawful things rather than make his brother to offend by acting against his conscience.

While it is obviously a Christian's duty thus to act tenderly towards a brother, the same rule does not apply to cases when it is not conscience but self-will, or prejudice, or false teaching that dictate the conduct of others. To accommodate ourselves to opinions or practices which we know to be contrary to the word of God is only to strengthen error, and it is our duty to point out the mistake of ascribing to conscience what is due to false feeling or wrong teaching.

May we be enabled to deal faithfully with our own consciences, and justly and tenderly with those of others. And may we assure ourselves that we are led and governed by the Spirit of God. Thus only shall each of us be enabled to say, "I have lived in all good conscience before God until this day."

LITTLE THINGS.—Great virtues are rare; the occasions for them are rare, and when they do occur, we are prepared for them; we are excited by the grandeur of the sacrifice; we are supported either by the splendor of the deed in the eyes of the world, or by the self-complacency that we experience from the performance of an uncommon action. Little things are unforseen; they return every moment; they come in contact with our pride, our insolence, our haughtiness, our readiness to take offense; they contradict our inclinations perpetually. It is, however, only by fidelity in little things that a true and constant love to God can be distinguished from a passing fervor of spirit.—Fenelon.

THE apostle of the Gentiles said: "I am not ashamed of the Gospel of Christ, for it is the power of God unto salvation to every one that believeth." The goal of its missionary ambition and hope is, that it goes forth to save. Not that it simply aspires to save, but it does save. To this result as well as to this intent it is the wisdom of God and the power of God.—London Christian.

MY own experience is that the Bible is dull when I am dull. When I am really alive, and set in upon the text with a tidal pressure of living affinities, it opens, it multiplies discoveries, and reveals depths even faster than I can note them. The worldly spirit shuts the Bible; the Spirit of God makes it a fire flaming out all the meanings and glorious truths.—Horace Bushnell.

PERSONAL ITEMS.

Mrs. Scott-Siddons says that an American servant will tie on her veil in a natty, graceful way that an English duchess knows nothing about.

Ex-Postmaster General Key presided in the United States Court at Knoxville, Tenn., on Wednesday for the first time since his retirement from the Cabinet.

J. M. Hill, a brother of Senator Benjamin H. Hill, of Georgia, died on his farm near West Point, in that State, a few days ago. He was over 70 years of age and during the greater part of his life was a man of influence in his county.

The late Vice President Wilson's mother-in-law, Mrs. Mary Howe, of Natick, Mass., celebrated recently her ninety-fourth birthday, and was visited by a large number of friends and neighbors. She is still in remarkably good health and spirits.

[Monroe, (Mich.) Commercial.]

Mr. Clarence B. Stoddard, the druggist, informed us that Mr. Louis Hope, a sufferer with rheumatism for a number of years, obtained the greatest relief by the use of St. Jacobs Oil.

KIDNEY-WORT

The Only Remedy

That Acts at the Same Time on

The Liver, The Bowels and The Kidneys

This combined action gives it wonderful power to cure all diseases.

Why Are We Sick?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

KIDNEY-WORT WILL CURE

Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders.

by causing free action of these organs and restoring their power to throw off disease.

Why Suffer Billious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?

Use **KIDNEY WORT** *and rejoice in health. It is a dry, vegetable compound and* **One package will make six qts of Medicine.** *Get it of your Druggist, he will order it for you. Price, $1.00.*

WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.
(Will send post paid.)

Liquid KIDNEY-WORT

In response to the urgent requests of great numbers of people who prefer to purchase a **Kidney-Wort** already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.

LIQUID AND DRY SOLD BY DRUGGISTS.

Implements and Machinery.

A $30 RIFLE for $20---THE FINEST REPEATER IN THE WORLD.

ONE RIFLE GIVEN FREE WITH EVERY SIX ORDERED.

26 Shot. 44 Cal. Wt. 8 to 10 lbs.

A CHANCE OF A LIFETIME.

We unhesitatingly assert that the following is the most remarkable offer ever made by any Gun Dealer or Manufacturer.

THE NEW EVANS MAGAZINE RIFLE, WITHOUT ANY EXCEPTION, THE MOST ACCURATE, LONGEST RANGED, EASIEST LOADED, QUICKEST FIRED, BEST CONSTRUCTED, SIMPLEST, AND MOST PERFECT BREECH-LOADING REPEATING RIFLE EVER MADE. **"Twenty-six shots in 60 seconds, without removing the Rifle from the shoulder."** No hammer in the way; throwing down the guard ejects, loads, and cocks. With commendable spirit, in the face of the general advance in all merchandise, the Evans Rifle Co. have decided to temporarily reduce the price of their *World-Renowned Arm*, placing it within the reach of every sportsman, and thereby ensuring for it the largest sale ever obtained by any repeating rifle in this country. The new model and latest improved Evans Magazine Rifle is exactly represented by the above picture. It is 44 cal., *centre-fire*, 28 and 30 inch barrels, weight from 8½ to 9½ lbs., checkered black walnut stock, and sighted with graduated sights **up to 1,200 yards**, 200 yards further than any other repeating arm, *at which distance it will penetrate 16 pine boards*, it being the most powerful repeating rifle ever constructed. The Magazine, **which carries 26 long cartridges**, is located in the stock and not under the barrel, the poise or hang of the rifle is in no way effected, nor its accuracy impaired by the emptying of the magazine, and as each cartridge is carried in a separate compartment, the gun is ABSOLUTELY SAFE. The working parts are all steel, the frame wrought iron, and the new **locking device** renders it *POSITIVELY SAFE* to carry when loaded. In short, the many improvements made in the New Model Evans, make it without doubt the finest magazine rifle in the world, *and it carries more cartridges than any other arm.* As stated above, the manufacturers of the Evans Rifle, in order to introduce their improved arm quickly and favorably to the public, have placed in our hands *THEIR ENTIRE PRESENT STOCK OF OVER SIX THOUSAND RIFLES*, **to the value of over one hundred and twenty thousand dollars**, for this purpose only, and on receipt of **$20**, which is only half the regular price, we will send by express or freight, boxed free, to any address, one of the New Model Improved Evans 26 Shot Rifles, as above described, warranted and guaranteed in every respect by both the manufacturers and ourselves, or will send C. O. D., on receipt of the express Agent's guarantee that the rifle will be returned *free* if not taken. When cash comes with order we give free a box of cartridges; (samples of the new Phœnix **3 ball** cartridges go free with each rifle.) **The Evans Saddle Rifle** is similar to the Sporting Rifle, except it is a trifle lighter (about 8 lbs.), and 22 inch barrel, only 2 inches shorter than the regular Winchester Rifle, and accurate up to 600 yards; 26 shot, same as other style, and provided with swivel and strap. This is the best of all rifles in the market for Western mounted use. Price, **$18** (former price, $33), *and one given free with every six ordered.* N. B.—THE EVANS CAN BE USED AS A SINGLE SHOT RIFLE, INDEPENDENT OF THE MAGAZINE, WHICH CAN ALWAYS BE KEPT FULL AND HELD IN RESERVE. *We ask no Money in* ADVANCE, *if the purchaser does not care to risk it.* WE ARE UNDER INSTRUCTIONS FROM THE EVANS RIFLE CO. *to forward a rifle C. O. D. on receipt of simply your express agent's guarantee that it will be returned free if not taken*; but when paid for in advance, cartridges are included free; not when sent C. O. D. Ordering six at one time and getting one free makes the cost only about **$17**. **Texas Jack** says: "The Evans Rifle is the best in the world. It shoots like a house afire." A. J. Boyd (sharpshooter) says: "It is the best gun I ever put to my shoulder. It can't be beat." Kit Carson, jr., says: "I have shot over 60 buffaloes with the Evans in one run. I will shoot against any man living at 600 yards," and The Evans Rifle Co. have thousands more testimonials equally commendatory. Address all orders to

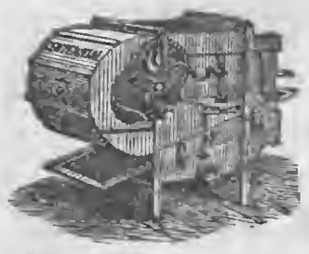
The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers. Address, **S. FREEMAN & SON,** Racine, Wis.

Humorous.

A little Connecticut girl got a glimpse for the first time, the other day, of gray hairs on her mother's head, and exclaimed: Oh, mamma, you've got a lot of basting threads in your hair."

On Sunday night we were sitting out in the moonlight, unusually silent, almost sad. Suddenly some one—a poetic-looking man, with a gentle, lovely face—said in a low tone: "Did you ever think of the beautiful lesson the stars teach us?" We gave a vague, appreciative murmur, but some soulless clod said: "No; what is it?" "How to wink," he answered, with a sad, sweet voice.

No One Can Breathe with Safety

air impregnated with the seeds of fever and ague, unless provided with a medicinal safe-guard against the ruinous disorder. That time-honored and highly sanctioned preventive, Hostetter's Stomach Bitters has won by merit the first place among medicinal preparations of an anti-spasmodic action, and is particularly esteemed in localities where the scourge of fever and ague is most severely felt. A course of this benign remedy invariably results in expelling all traces of the febrile virus from the system, and as the medicine is purely botanic and free from all deleterious ingredients, it is much to be preferred to quinine or other prescribed remedies; the effect of which is temporary, and which are calculated to produce baneful after effects. As a tonic and alterative the Bitters are incomparable, fortifying the system against disease, and regulating its various functions with certainty and speedily. The effects are not transitory, but permanent and decisive.

Gent.—"Yes, I can; I can smoke."

Library of Universal Knowledge.

Large Type Edition. A verbatim reprint of the last (1880) London edition of Chambers's Encyclopedia, with copious additions (about 15,000 topics) by American editors; the whole under one alphabet, with such illustrations as are necessary to elucidate the text. Printed from new electrotype plates, brevier type, on superior paper, and bound in 15 elegant octavo volumes of about 900 pages each. It will contain, complete, about 10 per cent more than Appleton's and 20 per cent more than Johnson's Cyclopedia, and though in all respects important to the general reader, it is far superior to either of them, its cost is but a fraction of their price. Volumes I. and II. are ready October 1, and other volumes will follow at least two each month, the entire work being completed by April, 1881, and probably sooner. Price per volume, in cloth, $1; in half Russia, gilt top, $1.50; postage, per volume, 21 cents. It has been our custom in previous publications to offer special inducements to those whose orders are soonest received. In pursuance of that policy, *on or before October 31 only*, we will receive

October orders, with cash, for the set of 15 volumes complete for the nominal price of $10 for the edition in cloth, and $15.00 for the edition in half Russia, gilt top. The price during November will be advanced to $10.50 and $15.75, and a further advance will be made each month till the work is completed. It is not supposed that the mass of those who will in time become purchasers of the Encyclopedia will make payment in advance as they now have the opportunity to do, though most of them *do pay* for their newspapers and magazines a full year in advance—but the old, tried friends of the Literary Revolution, who know that the American Book Exchange always accomplishes what it undertakes, and does what it promises to do, will be glad to save $5.00 by investing $10.00 and get the earliest and consequently best printed copies of the largest and best Encyclopedia ever published in this country, even at ten times its cost. Volumes will be shipped as may be directed, as they are issued, or when the set is complete. **$10.**

Chambers's Encyclopaedia

As a portion of the Library of Universal Knowledge, we issue Chambers's Encyclopedia separately, without the American additions, complete in 15 volumes 16mo. In this style it is printed from new electrotype plates made from very clear nonpareil type. Price, Acme paper, wide margins, half Russia, gilt top, **$7.00** edition, cloth, $7.50; Aldus edition (finer, heavier paper, wide margins), half Russia, gilt top, $15.00. In this style 14 volumes are issued October 1, and volume 15 will be ready about October 25, completing the work. To those ordering during the month of October, the price of the 15 volumes complete will be $7.00 for the cloth, $14.00 for the half Russia, gilt top. During November the price will be advanced to $7.25, and $14.50 for the set.

American Additions:

The very large additions to Chambers's Encyclopedia (about 15,000 topics) which are made by the American editors of the Library of Universal Knowledge, will also be issued separately in four volumes of 800 to 1000 octavo pages each, large type; the price being $1.00 per volume in cloth, $1.50 in half Russia, gilt top; postage, per volume, 21 cents. Volume I. will be ready in October, and other volumes will follow as rapidly as possible, the whole being completed by April, 1881, and probably sooner. Price for the set of four volumes *during October only*, net, $2.65 for the cloth, $4.00 for the half Russia, gilt top. The four volumes of American Additions will be found well-nigh indispensable by all owners of Chambers's, Appleton's, Johnson's and all other Cyclopædias except the large type edition of the Library of Universal Knowledge, from which it is compiled.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

Vol. XXXIX. No. 41. Whole No. 1602. | NEW YORK, OCT. 9, 1880. | Price Five Cents. $2.00 Per Year.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

"LADY WASHINGTON."

LADY WASHINGTON GRAPE. (From Life.)—Fig. 321.

The Vineyard.

LADY WASHINGTON GRAPE.

In the RURAL NEW-YORKER of Nov. 10th., 1877, was presented a portrait of this grape. But although it represented accurately the bunch from which the drawing was made, yet that bunch was considerably under the usual average size. Mr. Ricketts (Newburgh, N. Y.) brought several bunches to this office a week or so ago, from one of which our present illustration is made.

This grape has been sold during the past year. It is beautiful in appearance and of excellent quality, so that it only remains to be seen how well or ill it is adapted to various localities. The vine with us is very vigorous, bearing large leaves. The berry is, as may be seen, medium to large, round, yellowish with a tint of delicate pink where exposed to the sun, and covered with a thin, fine bloom. The flesh is soft, tender, juicy, sweet and good. Ripens with Concord.

THE "BETA."—A NEW SEEDING GRAPE.—Mr. P. R. G. Atwill, of Woodmont, Conn., sends us specimens of a new seedling grape, of which he writes:—"Six years ago in thinning a bed of beets, I found a grape seed just started. As it grew, I trained it to a stake, and at the end of the season it had made some six feet of growth. That Fall it was transplanted to the side of a board fence where it has remained since. It now has a spread of 16 feet and has fruited for the third time. It is perfectly hardy, and thus far free from mildew. The fruit begins to ripen between the Hartford and Concord. At the time this seedling was found no grape had been grown in the neighborhood of the garden, it is therefore a chance seedling. The bunches are not as large or as perfect as last season, owing to the number of rose bugs that infested the vine during the time of blossoming. From the place in which it was found—a bed of beets—I have given it the name of 'Beta.'"

REMARKS. Bunches rather small—compact. Berries white, medium size, globular. About the quality of Concord. These bunches, though loose in the box, arrived in perfect order. The skin seems firm though not tough, and the berry may prove valuable for the market.—EDS.

Pomological.

FRUITS AT THE MICHIGAN STATE FAIR.

T. T. LYON.

WHEN we consider the abundance of the fruit crop of the past season in our State, we are forced to the conclusion that our recent State fair has not, so far as the exhibit of fruits is concerned, realized all that may have been reasonably anticipated. Pomological Hall although well filled, was less crowded than usual. Plums and quinces were quite as fine and the display nearly or quite as extensive as heretofore. Among grapes, pears and peaches there were many excellent exhibits, although in diminished quantity. So far as peaches are concerned this may fairly be attributed to the extreme warmth and wetness of the season, which seem to have had the effect to bring the early and the later varieties very nearly together in ripening, maturing them at so early a period that those usually in season were ripe and gone too early for this purpose; while the occurrence of hot and wet weather for a week or more, just prior to the fair, induced the rot, even among varieties usually exempt from such a malady, ruining many thousands of bushels in the peach-growing regions and compelling the premature shipment of large quantities of the fruit at far from profitable rates. For this reason, doubtless, many varieties usually prominent in exhibits, were almost, if not altogether, unrepresented.

The display of apples was nearly or quite as large as usual; and the quality very satisfactory. A notable circumstance connected with this part of the exhibit was the conspicuous absence of the larvæ of the codling moth, as well as of overgrown specimens, and also of the scabby and defective fruits that so generally mar our collections. These latter results may doubtless be attributed to the general bountifulness of the crop preventing excessive development; and to a favorable season, with the consequent exemption from fungus, cracking and weather discolorations. To these we may add the fact that the preceding Winter was doubtless fatal in an unusual degree to many of the insect depredators upon our trees as well as fruits.

The reasons that under the above circumstances, have conspired to occasion a diminished exhibit, as compared with previous less plentiful seasons, must of course be sought in other directions. Those charged with the duty of working up and bringing together this exhibit may have relied too much upon the bountifulness of the crop of fruit; while, at the same time, those intending to exhibit may have been deterred by the anticipation of a surfeit; but to those fully conversant with the matter, the result will be in a great degree attributed to the well-known fact that, in the face of the notorious lack of space for last year's exhibit, in the same hall, the Agricultural Society, whose duty it was, had announced its determination not to increase the space for this purpose.

In the absence of professional exhibits of plants and flowers, the room was occupied by amateurs and smaller dealers; and although the space was by no means crowded, the *quality* is believed to have been a decided improvement upon the display of the previous year.

The officers of the State Pomological (now Horticultural) Society, who have now for several years been in charge of the display of fruits and flowers, have been earnestly engaged in the effort to perfect these portions of the Premium List, together with the system of examining, awarding and reporting premiums, with the purpose of rendering the whole as attive as possible, and at the same time increasing its educational influence. To this end the rule is imperative that no exhibitor shall be allowed to compete for a premium with a specimen which he has not *correctly named*; while in all collections for specific objects, his own judgment as to the relative values of varieties is made to appear in their selection. On the other hand, superintendents of divisions are selected with reference to their ability as judges, and are constituted chairmen of their respective committees, and supplied with blank reports designating the particulars which are expected to constitute such report; aiming by such means to secure, in such reports, the opinions of the committee as to the relative values of the fruits in question. In the making of the awards they are required "to consider, 1st, the value of the varieties for the required purpose; 2nd, the color, size and evenness of the specimens; 3rd, their freedom from insect marks or other blemishes." This system of awarding premiums has now been in operation three or four years, with such slight modifications as have been suggested by experience; and since exhibitors and committees have become familiar with them, they seem (as during the recent exhibition) to have proved highly satisfactory to all concerned.

Horticultural.

NOTES FROM THE RURAL FARM.

Cow-Pea Report.

ELEVEN different varieties of this Dolichos, which is neither bean nor pea, were received from W. B. Jones, of Herndon, Ga., and planted in drills six feet apart—one seed every six inches, May 18. Every other plant, where all grew, was hoed out, leaving them 12 inches apart in the drills.

WHIPPOORWILL OR JAVA has grown two feet in hight and spread out six feet. It began to ripen fruit (seeds and pods) Sept. 5th.

CONCK PEA has grown one foot in hight, spreading out over the ground 12 feet. It has not yet (Sept. 18) bloomed. It covers the ground so entirely that only a green mat of leaves can be seen.

GOAT PEA has grown two feet high. Pods began to ripen Sept. 1st. It has made but little vine, spreading out only two to three feet.

POOR LAND PEA.—This does not prove the best of the eleven varieties, as earlier we supposed it would. It has grown two feet in hight, spreading out four feet. Seeds were ripe Aug't. 15, and have been forming and ripening ever since.

BLACK-EYE CROWDER.—Only a few seeds germinated. The vines are low, spreading out and covering the ground for a space of six feet. No fruit has formed.

LITTLE LADY PEA.—Low vines, spreading over four feet of ground. In bloom Sept. 15. Cannot ripen its seeds.

LITTLE BLACK.—Immense vines, two feet high, spreading out 11 feet and covering the ground with a dense mat of vines and leaves. Fruit began to ripen Sept. 10.

THREE-CROP PEA.—Poor growth of vines. Ripens Sept. 15.

TORY PEA.—The same may be said of this as of Little Black.

EARLY FAVORITE.—The same may be said of this as of Tory and Little Black.

RED RIPPER.—Same as of Tory, Little Black and Early Favorite.

GOOSE PEA.—This grows low and does not cover the ground well. Ripens a great quantity of fruit; spreads out eight to ten feet. Fruit (pods) average eight inches in length with 20 seeds each.

The land where these peas grow had been in pasture for seven years. This was plowed and harrowed. No manure or fertilizer of any kind was applied. It is very plain from this report that the statement made by several agricultural papers that the seeds of cow-peas would not ripen in this latitude is a mistake. As anybody that chooses to visit this farm may see, some of the kinds are loaded with pods, some of which, as above noted, began to ripen in August. The vines are still green, fresh and growing. For the thriftiest of those mentioned six feet apart are too little. Unless sharp frosts should come earlier than usual, the vines will still make considerable lateral growth, and they have already entirely covered the space allotted to them.

Zinc Plant Labels.

P. B. M., in a late RURAL, says: "A label 'boom' is greatly needed." It is a matter of no little importance. I like to use a pencil and a common lead one, too—none of those patent affairs for me. Take strips of zinc, either new or old, it matters little which, and write name, date, etc., thereon, with an ordinary lead pencil. The writing may not be very distinct at first, especially if the zinc is new, but it will soon become so, and will remain for many years perfectly legible. How such an inscription made with plumbago on a zinc surface becomes practically ineffaceable may interest the scientific student, and the fact should not fail to arouse the attention of the practical horticulturist.

Way, Kansas. ELBRIDGE GALE.

REMARKS.—President Gale stated the above in the RURAL NEW-YORKER two or three years ago—the writer of this cannot at this time give the date, not being at the "Rural Grounds." But we wrote his name, the year, month and day upon a zinc label with an ordinary lead pencil, and attached it to an elm tree where it now remains. The letters are now more distinct than the day they were written. Pages have been written about plant labels and the necessity of some invention which should combine cheapness, durability, etc. Now, does not this one of Professor Gale solve the problem?—EDS.

Field Crops.

THICK vs. THIN SEEDING.

THE question of thick or thin seeding is just now receiving considerable attention from farmers through agricultural papers and Farmers' Clubs. It is a question of no little importance, and should be carefully considered by every farmer. From the differing and conflicting opinions that I hear expressed on this subject by farmers themselves, and from my own experience and observation, I have come to the conclusion that the question of thick or thin seeding is governed almost solely by the character of the soil and the way in which it is prepared.

In the report in a late RURAL of the experiments conducted by Professor I. P. Roberts, of Cornell University, who obtained the greatest yield from wheat with seed sown at the rate of three bushels per acre, we are led to believe in heavy seeding. But, on the other hand, we hear experienced, practical farmers report, through our (Elmira) Farmer's Club, that the best results were received from thin seeding. My experience has demonstrated to me that while thick seeding is advisable on a thin soil, thin seeding will give the best results if the soil is rich and in good condition otherwise. The same rule applies in a measure to the preparation of the soil. If we sow our wheat on cloddy, lumpy fields we must apply more seed per acre in order to obtain a good yield, though the soil may be rich in fertility; but, on the other hand, if the wheat ground be carefully and thoroughly prepared, a less quantity of seed will be required; for in the latter case good seed will grow, whereas if the soil is hard and very lumpy, much of the seed must perish. It is probable that the soil on which Professor Roberts experimented, where the best yield was received from wheat sown at the rate of three bushels per acre, was rather thin. Had the soil been deep and rich, doubtless his tables would have appeared quite different. In favor of thin seeding I will add that most of our best crops of wheat, as far back as my memory goes, have been produced from thin seeding. In one instance we harvested 40 bushels per acre (the largest yield of wheat we have ever realized), from seed sown at the rate of 1½ bushel per acre.

The secret of success in growing wheat is in having a good soil and giving it a thorough preparation before the seed is sown. When this has been accomplished let the seed be drilled in at the proper time, and of the proper thickness, which should vary with the condition of the soil, and there need be little fear of failure.

The question of thick or thin seeding applies to all kinds of grain as well as to wheat. Doubtless millions of bushels of grain are wasted annually from over-seeding, that might have been saved had our farmers a better knowledge on the subject. G. A. G., JR.

WHEATS.—Professor Blount writes us: "By this mail I send you a small quantity, each, of the Eldorado, the Black Bearded Centennial and my Hybrid No. 10 wheat. The latter is but two years old. It is the progeny of the Diehl, as father, and of the Virginia Golden Straw, as mother. It is a beautiful sample. Of course it is not 'fixed' yet. The Centennial I send is an enormous wheat and, what is most wonderful about it, some heads are smooth, the rest bearded. There are from 70 to 100 grains in every head; heads four and one-half inches long and nearly three-quarters of an inch in diameter, close and entirely filled, with not a single spikelet vacant."

[Received and sown. Many thanks. EDS.]

Dairy Husbandry.

THE DAIRY COW—NO. 10.

HENRY STEWART.

Setting Milk for Cream.

THE greatest mistakes in the dairy are made in setting the milk for cream. In the family dairy, where one cow supplies milk and butter, the arrangements are usually better than in some farm dairies. Here the arrangements are often surprisingly bad. I have seen the milk of four cows set in a sleeping-room, and under the bed. The young woman who managed that dairy prided herself on her good butter. What she knew of bad butter must have been fearful to contemplate. In some farm-houses the milk is set in the living-room where the cooking and eating are done, and where, in the evening, the farmer and the hired man smoke their pipes and dry their wet boots and socks under the stove. No wonder some persons prefer oleomargarine to butter made in that fashion. If these lines come under the notice of anyone, man or woman, who keeps milk under such circumstances as these, or in any way approaching to them, I would say to him or her, that good butter cannot be made in that way, and the labor spent over it is only half or quarter paid for.

The first necessity in setting the milk is perfect purity of place and surroundings. Then there should be the following adjuncts:

A moderate circulation of fresh and moist air.

Shelves raised at least three feet from the ground.
